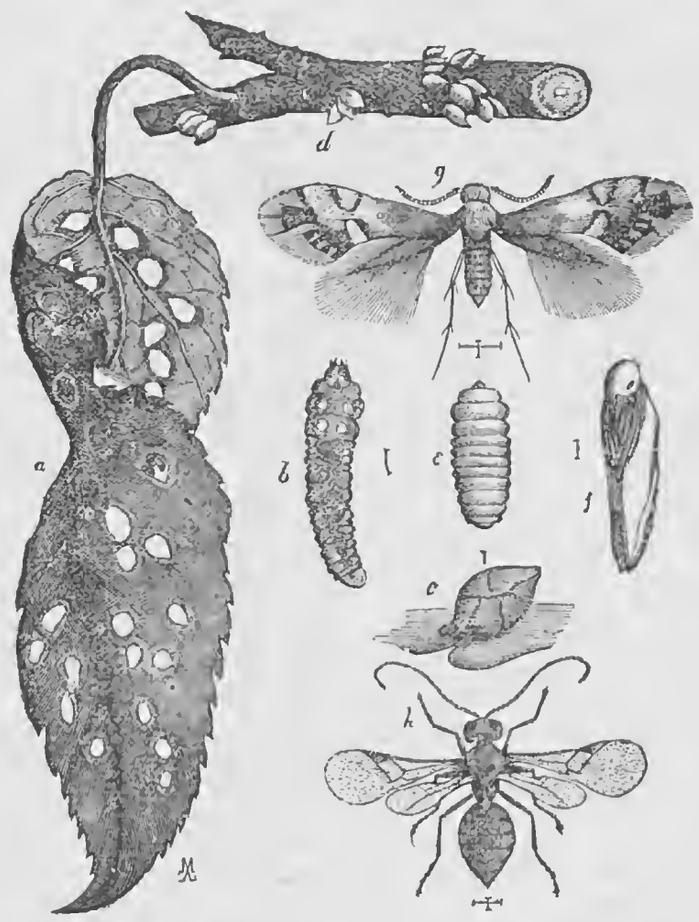
It now cuts out an oval or somewhat triangular section of the dry, epidermal tissue above and below it, fastens these together by their edges with silk, all except a small space through which it can pass its head and the first two or three segments of the body. With all of its body except the front part in this case, it now walks a short distance on the leaf, but apparently soon tiring of that mode of progression, it fastens a web to the leaf or limb and lets itself down. Blown by the wind against the limbs or trunk of the tree, or any other object, it soon finds some convenient place where it may fasten its case. This done, it retreats to the inside, changes its position somewhat, and in a short time changes to a chrysalis, shown at *f*. Figure *a* shows a leaf in which several of these little worms have been at work, each cutting out its case. Figure *d* shows a limb with several of these cases attached. In the more northern portions of the United States it is probable there is only one brood of these worms in a season, the larva assuming the form of *e* in the case, in which condition it passes the Winter, to undergo its changes the following Spring. Farther south there are, Professor Comstock says, two broods, the first entering the cases the fore part of July, to come out as moths from the latter part of July to the first of August, the second brood to enter the cases to pass the Winter some time in October. The moth has the base of the wings leaden-gray, the outer half golden, marked with silver and brown, as seen in the figures.



THE RESPLENDENT SHIELD-BEARER IN VARIOUS STAGES.—FIG. 269.

But the question of most importance is, can we prevent the depredations of these little pests? In spite of its protecting case, ants feed upon the caterpillar, and there are at least two species of small hymenopterous insects that are its parasites. If there are but few of the worms little harm can be done, as they are so small; but if they occur in great numbers their ravages make a serious draft upon the nourishment of the tree. Professor Comstock says that the only way to cope with them is to destroy the cases in the Winter time, and he recommends spraying or painting the limbs and trunk of the tree with a mixture of kerosene and water in the proportion of three parts to 100. A mixture of lime and sulphur, dissolved in hot water, has been used with good effect.

Carbondale, Ill.

Pomological.

THE FAMEUSE APPLE.

T. T. LYON.

W. C. BARRY, in the Country Gentleman, has taken occasion to commend this old favorite of the Northern orchardist, as a highly desirable dessert apple. His remarks seem to have provoked criticism by another correspondent, to which Mr. Barry replies in a recent issue of the same paper.

I altogether agree with Mr. Barry as to the great beauty and fine quality of this apple when well grown; but, while it is, in a peculiar sense, a Northern apple, failing wholly south of New York and Southern Michigan; even in that and other northern latitudes, as soon as the trees acquire a moderate age it is exempt from cracking and fungus only in exceptionally favorable seasons; while, at the same time it is so prone to overbear, that only the best of management, including high culture, judicious pruning, and persistent thinning, will prevent the carrying of more fruit than can be fully matured. This I understand to be true of this fruit in that paradise of the apple, Western New York, and it is equally true in Michigan; while the reports of societies in the British Provinces characterize it as liable to the same objection there. Such being the almost universal experience with the Fameuse, I review the article of Mr. Barry for the purpose of proposing a substitute for his recommendation. More than a quarter of a century since a seedling of Central Michigan, originating in all probability from the Fameuse, and named, from its place of origin, Shiawassee Beauty, was brought to public notice. Possessing the white, delicate flesh, juiciness and refreshing flavor of its supposed parent; of similar size and appearance, and of the same season, when specimens were sent to Mr. Charles Downing, it was long before he became satisfied to consider it as distinct, so very similar are it and the Fameuse in quality. Experience, however, shows obvious differences. The Shiawassee Beauty is more distinctly oblate in form with a brilliant blush, such as is only occasionally seen upon the Fameuse, while the distinct stripes of the latter are never seen upon the former. The similarity in flavor, texture, juiciness and color of flesh is so marked that, with the skin removed, it is scarcely possible to distinguish the one from the other. So far, then, there would be little choice between the two.

The advantages that give the Shiawassee Beauty the preference, in my estimation, are, that the flavor is somewhat richer; that the fruit is much less liable to scab and crack; while I have never known it to perceptibly suffer in quality from overbearing. The size will also average larger than Fameuse.

The tree is slightly more upright in habit, equally vigorous, and, so far as I have been able to learn, fully as hardy. It has been widely tested in Michigan and proves universally successful. I have heard little of its success in other States, although many years since cions were widely disseminated. I can imagine no good reason why it should fail in any locality to which the Fameuse is adapted. One reason why it is not generally known may be, that no person seems to have made a specialty of its growth and dissemination, and since the texture is rather delicate for rough handling, and it is, therefore, only adapted to near-by marketing, it has never attracted the attention of commercial planters.

Industrial Implements.

The New Buckeye Senior Riding Cultivator.

This excellent cultivator is made by Messrs. P. P. Mast & Co., of Springfield, Ohio. It is strictly a riding cultivator, having higher wheels and a greater weight than the Buckeye Junior. It has been furnished with all possible improvements to fit it better for this season's work. Among its many claims to the favorable attention of our readers, we have space only for a few: It is equipped with seven shovels, wood beams, wood standards and seeding attachment, though it is sold either with or without the last, and can be used with four or six shovels for corn. It has rotary shields which experience has shown to be the

best. Its improved beam coupling or hinge holds the beam firmly in an upright position, making it run steadily and easy to handle. The shovels are strong and adjustable so as to throw the dirt to or from the corn. The foot treadle, or levers for raising the shovels when turning round at the end of a row or to pass an obstruction, are especially convenient. The high wheels enable it to pass over corn in the last plowing. The seat is adjustable and can be readily balanced for a heavy or light driver. For fallow five, six or seven shovels can be used. The shovels are arranged in an A-shape so that the trash is carried out on each side and clogging is thus prevented. The rear shovels, being narrow, leave the ground smooth and free from ridges. We recommend all our readers in want of such an implement to send to the above address for descriptive circulars of this one, which will be promptly forwarded on application. G. B. B.

THE LINCOLN CREAMERY, made at Warren, Mass., is a very rapid and successful separator of cream from milk. Experiments with this creamery at the New York State Fair, in 1880, were made for the satisfaction of the Examining Committee. The milk was set in water at a temperature of 56 deg., without ice, and showed a perfect separation of cream inside of six hours. It is made in fine style and has many excellent points, worthy of examination.

Miscellaneous.

BOOKS, CATALOGUES, ETC.

STATISTICAL ABSTRACT OF THE UNITED STATES, 1880. Third Number. Treasury Department, Washington, D. C.

EIGHTH ANNUAL REPORT of the New Jersey State Board of Agriculture, 1881. P. T. Quinn, Secretary, Newark, N. J.

NINTH ANNUAL REPORT of the Board of Trade of the City of Newark, for the year ending January 12, 1881. P. T. Quinn, Sec., N. J.

KENTUCKY GEOLOGICAL SURVEY and Bureau of Immigration. This pamphlet of 29 pages is intended to give information about the climate, soil, timber, etc., etc., of Kentucky, to those either from Europe or elsewhere who are seeking new homes. To be had, *gratis*, we suppose, from J. R. Proctor, Frankfort, Ky.

THE MAY CROP AND STOCK REPORT of the Ohio State Board of Agriculture, in addition to the following figures on wheat, gives much valuable information on the condition of other crops, fruits and farm animals, forwardness of Spring planting and sowing, wages paid for farm labor, etc., etc. It is a pamphlet of 32 pages and contains a "Wheat Map" of Ohio, showing by counties the present condition of wheat, the probable yield for 1881, and the amount of old crop still in producers' hands. The information is based on estimates made by about 1,000 correspondents in nearly all the townships of the State, mostly practical farmers, capable of judging of the matters they report on, and can be depended on as approximately correct. The figures show that only 19 per cent. of last year's crop, or 10 378 299 bushels of wheat, are still in the hands of the producers, and that the probable yield of the State this year, if we have a *fair average season* from now till harvest, will be, as telegraphed to us week before last, about 44,895 653 bushels, or 85 per cent of last year's fine crop. The wheat map shows the best wheat this year lies in the level, black-soil counties of the north-west part of the State. These average fully 100 per cent. as compared with a year ago, while the rolling counties further east and southeast, average only a little over 80 per cent., and the hilly Ohio River counties, only about 65 per cent of last year's yield in the same localities, respectively. This is usually true after a snowy Winter like the past, while in a very open, rainy Winter, like that of 1879-80, the level counties suffer most. The wheat map also shows that the wheat is best in the northerly part of the State where there was most snow. The report will be sent to any Ohio address upon application. The outlook is certainly more encouraging for Ohio farmers than for those of most of the other Winter wheat States, where there was, as a rule, less snow in early Winter; and hence, poorer crops and firm prices. The figures given are only *estimates* at best, but after traveling through sixty of the eighty-eight counties of the State, during the last two weeks, to examine the wheat, Secretary W. I. Chamberlain is convinced the estimates are fairly given for the various localities, and not in the interests either of "bulls" or "bears" among speculators, but of *truth*. His own estimate for the State would have been *a trifle lower* than 85 per cent.

THE JOURNAL OF THE AMERICAN AGRICULTURAL ASSOCIATION.—This book of 250 large pages, (six by nine inches) the first number issued, is highly creditable to the secretary, Mr. Jas. H. Reall, involving, as it must have done, an immense amount of tedious labor which seems to have been performed in a faithful, painstaking manner. Many important agricultural topics are ably treated by such writers as Dr. J. B. Lawes, Prof. J. P. Sheldon, Prof. James Law, Dr. John A. Warder, and others quite too numerous to mention. This work may be procured of the Secretary by addressing him at 127 Water St., New York city. Price 75 cents which it is assuredly well worth.

QUARTERLY REPORT of the Kansas State Board of Agriculture for the quarter ending March 31. J. K. Hudson, Topeka, Secretary.

"OLEOMARGARINE as a Pure Food Product." A pamphlet of 24 pages issued by the Commercial Man'f'g. Co., of New York.

RURAL BRIEFLETS.

MR. J. BURWELL, of Rensselaer Co., N. Y., favors us with a statement which, if trustworthy, is of considerable importance and should place all cultivators of the currant under obligations to him. It is as follows: "One pound of alum dissolved in two gallons of water and sprinkled on currant bushes will kill the currant worm every time, with no danger of poisoning those who eat the fruit. I have used it for years and it has never failed in a single case."

FOR this climate, it is now time to rub off all but the strongest shoots of grape vines planted this Spring or last Fall. If more than one bud is left, there will be no chance of fruit another season and the chances of a third season are not so good. The one shoot left should be tied or supported as soon as it has made enough growth for that purpose.

WE find that our specimen of the Kieffer Hybrid Pear has from some cause been killed nearly to the ground. We should like to hear how this much-puffed pear has stood the Winter elsewhere.

THE Variegated Abutilons and Purple-leaved or Rural Bronze Castor-oil plant are splendidly adapted for forming beds of handsome, vigorous foliage. The Castor-oil plant will need to be pinched back from time to time.

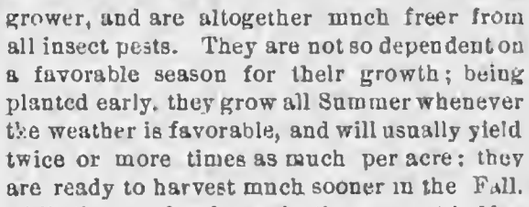
THE present is as good a time as any in the year for layering plants of which it is desirable to increase one's stock. Vines, all sorts of ornamental shrubs and many evergreens can thus be propagated. It is only necessary to bend down a branch into a little trench beneath five or six inches deep and cover it firmly with soil. In the Fall the layer may be severed from its parent stem and planted.

DR. LAWES has said in a late article, published in the Agricultural Gazette of London, that even if it were resolved generally to carry out a system of high farming by a supply of purchased fertility, the supply could not be obtained except at a price that would prohibit its use.

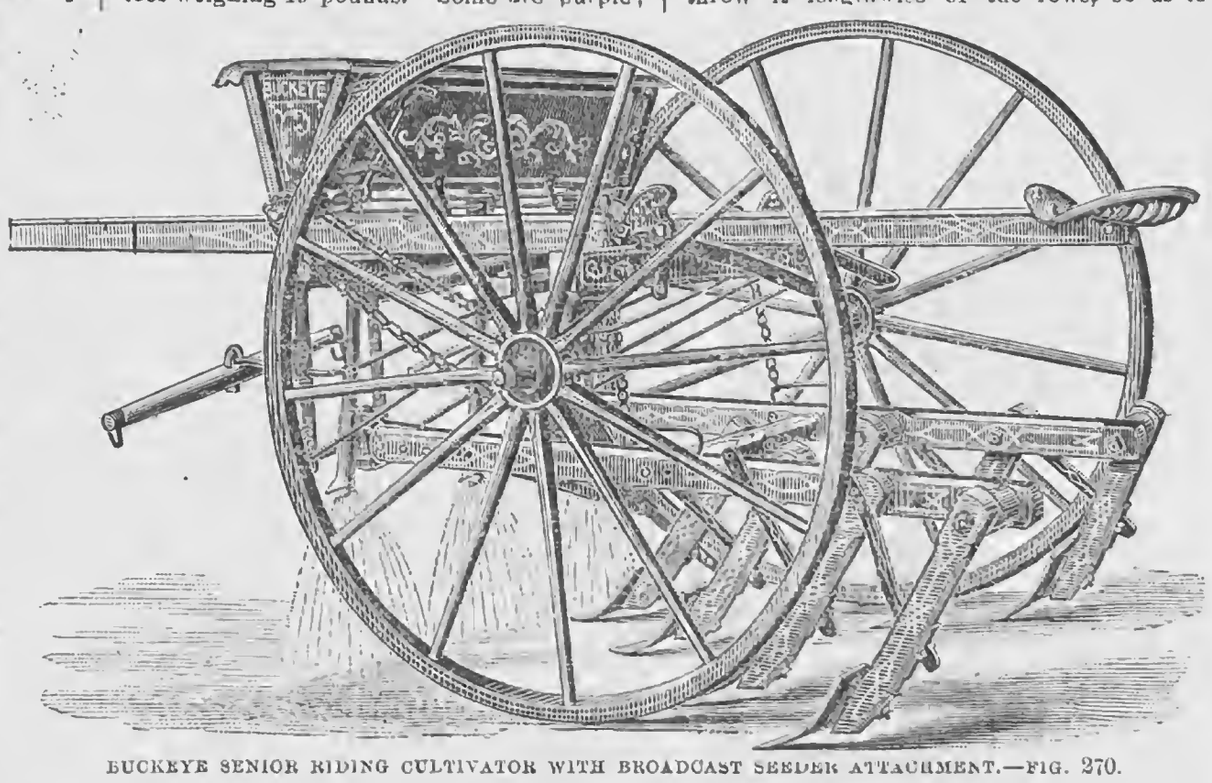
WE have received a box containing 26 potatoes weighing 19 pounds. Some are purple; some white. They resemble in shape the White Elephant. We have received no letter regarding them and the box gives no clue as to the sender or the place from which they were sent.

A SUBSCRIBER, while at the office the other day, said that, contrary to the RURAL'S advice, he had drilled in with wheat 250 pounds of tan bark unleached ashes per acre and the wheat was looking remarkably fine. We feared that unleached ashes in contact with the seed would harm them.

THE destruction of the currant worm should not be delayed. If the work be thorough one season, few will appear the next. If one has no hellebore, then hand-picking should be resorted to—a very trying, tedious job. Slaked lime and alum water are recommended in these columns. But hellebore is certain and swift destruction to the currant worm. It may be mixed with flour or plaster and dusted on the leaves while moist with dew. Or it may be steeped a few moments in hot water and applied with a whisk broom when cool. One ounce of hellebore to a pailful of water is enough.



VALUE AND CULTURE OF MANGELS.—From the pen of our occasional contributor Mr. J. S. Woodward we find in the agricultural columns of the N. Y. Tribune the following timely suggestions on mangel culture: Learned men, Mr. Woodward says, may laugh at the root crop as much as they please, and prate that roots are nothing but water; but when he looks at his stock he feels that if what they say is true, then "great is water and greatly to be praised," but he much prefers to have it inside the skin of a mangel, and so does his stock. . . . . He last year had eight acres that averaged not less than 1,400 bushels per acre. . . . . While carrots are better than swedes and swedes are richer in food-elements than mangels, still he prefers mangels, for the following reasons among others: They can be planted early, before the press of other work comes on, and can be cultivated and the principal part of hoeing and weeding done before the hurry of harvest time; they are never attacked by those little black fleas that are the bane of the swede grower, and are altogether much freer from all insect pests. They are not so dependent on a favorable season for their growth; being planted early, they grow all Summer whenever the weather is favorable, and will usually yield twice or more times as much per acre: they are ready to harvest much sooner in the Fall, while the weather is good; they are not half as liable to heat and spoil in pits or cellars as the swedes. Besides all these, for meat making, and especially for milk and butter making, they can be fed in much greater abundance without the bad results of imparting a bad flavor to the products. If you raise the Long Mammoth varieties, you must thin to single plants about sixteen inches apart, but for the main crop he greatly prefers any of the very many varieties of Yellow Globe or Ovoid; really in all these he can see but very little difference. . . . . Any good rich soil, the richer the better, will give a paying crop of mangels. A strong gravel is good, or a sandy loam, but he prefers a pretty heavy loam, almost a clay; if naturally or artificially underdrained, this, if rich, will give the very best results both as to quantity and quality. . . . . The main point is to have the land rich and fine; plow deep and be careful to plow well; harrow, cultivate and roll till the surface is mellow and no lumps are left; mark for rows 30 inches apart, with a marker similar to a corn-marker. Sow not less than 200 pounds of bone-flour and three bushels of salt per acre; to do this, throw it lengthwise of the rows, so as to get all you can immediately on them. . . . . Any good seed drill will answer, sowing as directly on top of ridge as possible, and using plenty of seed, not less than five pounds per acre. He starts the cultivator as soon as he can see the rows plainly, and by using, on side of cultivator next the mangels, a tooth made of steel and L-shaped, he can run very close to them without injuring the plants. As soon as weeds start he again cultivates, and when the leaves of the young mangels are about two inches long, he "chops out," i. e., cuts with a sharp hoe through and removes one foot of row, then leaves six inches and cuts out another foot, and thus goes through, leaving hills six inches along the row and one foot between hills. In about a week after this "chopping out," he cultivates again and then weeds; in doing this he uses hoe and hands, taking out all weeds and from the hills all plants except from three to four in each. He does not get as large roots, but he gets a much larger yield per acre by raising in hills, and he much prefers moderate-sized roots; they handle better and are not so coarse and woody as the very large ones. . . . . In harvesting he pulls by hand, and, having a leather mitten on his hand, twists the top off, throws four rows into a single row, and from these throws directly into the wagon. At cellar they are thrown on a rack or riddle, made of strips two inches wide placed one and a half inch apart lengthwise; this is about eight feet long and one end is placed on wagon and the other on window or trap to cellar, and by rolling down this the dirt is nearly all rattled off and falls to the ground through the openings between the strips. If not plenty of room in cellar to store crop, they must be pitted. Make pits on dry ground any length desired, and let the bottom be about five feet wide, and sunken a foot or more in the soil if dry enough; place the mangels in this as high as they can be made to lie easily; put on plenty of straw and cover one foot deep with earth; place a ventilator consisting of a four-inch drain tile, or a box four inches square, into the top of the pit, every six feet, letting it project two or three inches above the dirt covering. This will carry off all moisture from the mangels as they season, and will keep them perfectly dry—a very important thing in keeping them well through the Winter. Before very cold weather, remove the ventilators, filling the holes with straw, and cover the heap a foot or more deep with coarse straw manure; or in the absence of this, give another coat of straw and another foot of dirt. They must not be allowed to freeze if we would have them keep.



BUCKEYE SENIOR RIDING CULTIVATOR WITH BROADCAST SEEDER ATTACHMENT.—FIG. 270.

SKIPPERS or worms found in hams and bacon are the larvæ of some kind of an insect, says the Sun. Usually they are the grubs of the bacon beetle, a dark-colored beetle, about a quarter of an inch or a little more in length, with a whitish band across the back. Now, as the female beetle must get to the meat in order to deposit her eggs, it is quite evident that if she is kept out there will be no skippers in the meat. The same is true of other insects infesting meat, and the simple preventive is to keep the meat wrapped in heavy paper and lime-coated cloth, through which the insects cannot find a passage. Tight boxes, barrels, or even a moderately tight smoke-house, will usually answer, having a fine wire screen over the ventilator or chimney. The sugar-cured hams found in our markets are first wrapped with brown paper, then inclosed in cloth bags and these painted with yellow-ochre or some similar cheap paint. None of the meat-infesting insects can get at these hams when surrounded with such materials. Rusting of bacon is caused by exposure to the air, or perhaps moisture, air and heat. It should be put in tight boxes and in a cool, dry place, and there will be no trouble with rust.

SAYS the Live Stock Journal of London: "It is not a little startling to find that whilst we have been making recent outcries against the importations into this country of oleomargarine, butterine, and other villainous compounds, which are palmed off as Irish and English dairy produce, establishments for the manufacture of these same articles are springing up in our midst."

QUITE recently harvesters using cord for binding have been invented and are now taking the lead, and are preferred to those using the wire. The change from wire to cord has created a new and very large demand for the latter article, and the Prairie Farmer estimates that during the present year no less than 5,000 tons of cord will be required for binding grain alone and by 1885 not less than 40,000 tons will be needed to supply the demand. Where all this is to come from, and out of what kind of fiber it is to be constructed, are questions which remain to be answered.

ANOTHER LAND OF PROMISE.—This time it is not in Manitoba, or in some far off region difficult to reach or explore, but in the old State of Massachusetts, remarks the Inter-Ocean. An English farmer, who has resided several years in Massachusetss, writes home that there is room for thousands more of good farmers in the Bay State, where they can, by judicious investments and management of their land, secure double what is possible in England. He says land can be obtained at from $5 to $25 per acre, and on credit, if desired.

GOOSEBERRIES, says the Gardeners' Chronicle (London), are, as a rule, vapid and inflated, and that is one reason for the objection raised in certain quarters to gooseberry shows and kindred displays, which tend to foster qualities which it is not desirable to encourage, at least at the expense of other more valuable properties. A good crop of gooseberries of moderate size and superior flavor would, with most people, be far more acceptable than a bushel of "Thumpers" and "Roaring Lions."

Big gooseberries are, however, just what we are working for here—big ones that will not mildew. It is surprising what a fascination big fruit, though generally of inferior quality, carries with it.

YIELDS OF EARLY AND LATE POTATOES.—In regard to the time of maturity of the later sorts of potatoes, Mr. Jonathan Talcott states in the Albany Cultivator, that all else being equal, the later sorts will produce a larger crop on the same soil than the earliest sorts, in the same season, as they have a longer time for growth, and especially if the latter part of the season be showery so that the ground is kept well moistened throughout the period of the growth of the tubers. In such cases he has known the same sorts planted both early and late on the same farm, with the same cultivation in both cases, when the later planted would produce nearly or quite double the quantity to the acre that the earliest planted did. . . . . His experience has been that the last half of May is the best time to plant potatoes. With the ground well fitted, and with good cultivation afterwards, he has thus succeeded in growing the best crops of potatoes, having never failed, while he has failed with an occasional early planted crop.

THE Scientific American finds still another use for empty fruit cans. It recommends piercing several small holes in the bottom and sides and sinking them in the earth near the roots of strawberry or tomato or other plants, the holes to be made of such size that when the can is filled the fluid can only escape into the ground very slowly. A very little care in filling the cans occasionally will keep the ground well irrigated. Tomatoes would scarcely need the watering—but the plan might prove excellent for strawberries.

EXPERIMENTS IN HOG FEEDING.—An Iowa farmer, says the Ag. Ed. of the N. Y. Herald, put up 20 one-year-old hogs, and for the first 28 days fed them on dry shelled corn, of which they ate 83 bushels and gained 837 pounds—over 10 pounds to the bushel of corn. He then fed the same hogs for 14 days on dry corn-meal, during which time they consumed 47 bushels and gained 553 pounds, or 11¾ pounds to the bushel. The same hogs were then fed 14 days on corn-meal and water mixed; they consumed 55½ bushels of corn and gained 731 pounds, or 13 1-6 pounds to the bushel of corn. He then fed them 14 days on corn-meal, cooked, and after consuming 45 bushels of the cooked meal, they gained 799 pounds, or very nearly 15 pounds to the bushel of meal.

A MEDIUM-SIZED potato, says Dr. Roland, is more certain to mature than a small one; and best results are obtained from large potatoes, as the eyes or germs are more vigorous, and there is more substance to feed them in the beginning.

SWEET WILLIAMS.—A bed of Sweet Williams, to be really effective, says Gardening Illustrated, should have the leading shoots tied to stakes, or the wind will blow the plants about and make a wreck of many of them. The flowers of a good strain are so bold in appearance, so varied in character, and so handsomely marked, that they will repay a little extra attention at the proper time.

THE Detroit Free Press says that country people pity the denizens of a city who have to use lake or river water, but when an Ohio farmer cleaned out his well last week, he fished out two cats, a paint keg, two old brooms, an old hat, a boot, and a dozen shingles.

JUMPING THE ROPE, says the N. Y. Herald, has just killed a little girl in Wisconsin, as it has done elsewhere. Parents and teachers never seem to realize that the emulative spirit kills children more rapidly than it does adults. . . . . The Red Cloud Indians are to have a boarding school. As soon as the institution begins business the pupils will begin to write to their parents for money. Then the proud old braves will learn some of the miseries of civilization. . . . . Hebrews are not to blame for feeling sore about the hotel restrictions that their whole race is subjected to because of the alleged undesirableness of a few vulgar fellows; but if all men are free and equal why do not some members of the ancient family go into the business themselves and teach their contemners how to run a hotel? . . . . . It was a young "æsthetic" from Boston, who on first seeing Niagara said, "What a beautiful bang!"

Everywhere.

RURAL SPECIAL REPORTS.

Kansas.

AGENCY, Osage Co., May 9.—Spring is two weeks later than usual; but it has been favorable for work. Corn all planted and some of it up nicely. Wheat came through all right and the late rains have sent it up with a rush, and the outlook for a good crop is very flattering. The peach trees are full enough for a good crop; and there will be plenty of apples and an abundance of small fruits. Taken altogether, the prospect for a year of *plenty* is very good. D. B. R.

PARSONS, Labette Co., May 14.—The season opened two weeks later than the average. Now it is 10 days earlier. In the immediate vicinity wheat is very good and headed. Further to the northwest the damage from chinch bugs is general and serious. Corn unusually promising. The earliest is six inches high. J. B.

Missouri.

GRANT CITY, Worth Co., May 6.—After a long, severe Winter, we are having nice Spring weather. Winter wheat looks as if it might make half a crop. Spring wheat and oats are up and looking well. Farmers are plowing; the ground is in splendid condition. J. T. O.

Nebraska.

ST. JAMES, Cedar Co., May 9.—The "Old Muddy" or "Big Muddy," as the Missouri is familiarly called, has been dreadful this Spring, but is now returning to its banks and to its ordinary yellow, dull career. Small grains are nearly all sowed. People are preparing to plant corn, most of which will be put in within two weeks. A little snow still lingers in drifts about shady places. J. N. L.

New Jersey.

QUINTON, Salem Co., May 12.—Our Spring opened late and cold. Grass and grain are consequently backward, and need rain badly. It is now hot and dry. We have had but one light shower this month. Farmers are mostly through planting corn. E. H. S.

New York.

NORTON HILL, Greene Co., May 16.—We have a fine growing time here at present. On the 11th a terrible tornado passed over this place, unroofing buildings, smashing windows, tearing up apple trees and carrying them bodily over fences. Hail stones came with the wind and cut crops and trees considerably, but as the trees were not fully in bloom I think we shall have some fruit. The storm was only about two miles wide by about 14 in length, so far as we can hear at present. Everything looks prosperous. Oats are just coming up, and more acres than usual have been sown. Fall-sown grain looks much better than last year, owing to its being covered with snow most of the Winter. A larger area was sowed to it than usual. Corn is now being planted, and there is a large increase in acreage. Last year's was the best crop we have had, and it has induced farmers this year to plant more. I think, as a whole, corn averaged 40 bushels of shelled grain to the acre all through this country. Flint is the only corn planted here. Dent will not ripen. Of course, there were some fields that averaged as high as 70 bushels of flint corn. We call that a big yield here, and when we can get that yield we are satisfied with our crop. It is all hilled cultivation as flint corn will not stand up well unless it is braced with the dirt of the hill. Farmers, as a rule, here are in good spirits, and don't buy oleomargarine to make their cows yield 40 pounds of butter per head per week. We are now looking for the boarders from New York who visit this section every Summer, and who will make a market for much of our produce. They have brought a good deal of money into this country, which has been laid out on farm buildings, and their presence here has caused the setting out of a great amount of fruit, so we think our country looks much better than it did ten years ago. We like to report progress, and I think we gain a little every year. There is a falling off in the dairy interest, as there is so much "composition" butter being thrown upon the market. Last week all through the thermometer was in the eighties and nineties, so we find Summer is upon us. W. H. I.

STERLING STA., Cayuga Co., May 10.—We have had a very cold Spring with little rainfall; but yesterday the mercury rose to 84 deg. in the shade, and we had a shower in the evening. To-day is nearly as warm and the sky looks showery again. A large acreage of potatoes is being put in hereabouts. The few Burbanks planted last year yielded so well that they are being largely planted this year in place of other varieties. The appearance of our fruit trees gives promise of an abundant crop of all sorts, and many new orchards have been set, one farm in our vicinity having been enriched by the setting of fruit and ornamental trees, shrubs, etc., to the value of $800. Such orders as that are worth looking after by agents. By the way several of our young men are "tree peddlers," and I have learned by experience that one is just as safe in buying from them as from "first hands." One young man filled his small fruit orders last year from stock procured of J. T. Lovett. This year his stock comes from E. P. Roe. Many a home rejoices in luscious fruits procured through the solicitations of an agent, that would otherwise be as destitute as a treeless prairie. Farmers usually do not take kindly to sending off for things themselves, and improved implements as well as fruits are introduced by the irrepressible agent. Quite a start was made here last year in the growth of Amber-cane; but owing to the lack of suitable apparatus for working it up a considerable part of it was foduced out. The only convenience for expressing the juice was through home-made wooden rollers worked by horse-power, which was not very satisfactory. Enough was obtained, however, to prove that the product was of excellent quality and could be produced at a profit. Those who had any surplus sold it readily for 60 cents per gallon wholesale. The sugar beet was also quite extensively planted last year, simply to test its adaptability to our soil and climate, and the results were so favorable that had Oswego capitalists started a beet sugar factory, as they proposed, they could have drawn their supplies largely from this region, provided, of course, the prices were satisfactory. Wheat in this section looked well when snow went off, but the Spring has been so unfavorable that the present outlook is poor indeed. More than ever before am I convinced of the advantage of early sowing and ample fertilizing for this crop. Some fields that look as if they would hardly return the seed, show rank-growing patches wherever a load of manure was put last Fall. Superphosphates are not very extensively used here yet. E. K. B.

North Carolina.

BROOKSTON, Warren Co., May 11.—There will be some peaches here yet. I find that in our haste to be the first to report either good or evil we are often mistaken. Many large orchards did not average one bloom per tree, while others were not injured by the Winter's frosts. We now find that the frosts of early April left enough for a fair crop. The acreage planted in cotton is much larger than last year. In April I reported to our Commissioner of Agriculture an increase of eight per cent., but now I think I made it too low. M. B. P.

Ohio.

LITTLE HOCKING, Washington Co., May 15.—The farmers were very late about plowing owing to wet weather, but planting is going on rapidly now. Ground in good condition. Wheat promises about three-fourths as much as last year. Grass is doing finely. Pastures were never better at this time in the year. Apples about half a crop; peaches abundant; blackberries generally killed. Cattle wintered well, but sheep look bad. A. L. C.

Texas.

SAN ANTONIO, Bexar Co., May 8.—Are not the inclosed specimens of grass Bermuda? It makes an excellent lawn, with a thick, tough sod, smothering everything else and remaining green the entire year. It seeds the second year after planting. [Yes. Our friend is probably mistaken as to its "seeding." We would feel obliged for some of the seeds.—EDS.] Our crop prospects in Southern Bexar are good. We had frost the morning of the 14th of April, but it did very little damage. We will have plenty of peaches and plums. Early corn, peas, beans, Irish potatoes, and, in fact, most kinds of garden truck, are now usable. J. M. M.

West Virginia.

LUMBERPORT, Harrrison Co., May 10.—We had a long, cold Winter, a late, wet Spring, so that farmers generally are far behind with their Spring work. Very little corn has been planted. Wheat looks well; grass is fine and vegetation is making a rapid growth. W. H.

The Querist.

ANSWERS TO CORRESPONDENTS.

Hardy Grapes, Peaches, Pears, Plums and Apples.

R. T. J., Austin, Texas having seen it stated in various catalogues that Moore's Early Grape is frost-proof or, in other words, that it will stand 10° to 15° below zero—asks, 1, whether it will do so in that climate, and whether it is likely to thrive there; 2, are there any peaches, pears, plums or apples that are really iron-clad.

ANS.—1. Moore's Early is recommended more especially because, while of only fair quality, it is pretty sure to ripen at the extreme North. It will doubtless prove abundantly hardy where the temperature does not range lower than 15 degrees below zero, should it be able to withstand also the Summer climate of that locality. It is new and hence comparatively untested; still it seems quite as likely to succeed as Concord or Hartford Prolific, both of which are esteemed valuable in Texas, and are as nearly "iron-clad" as anything we know among grapes. 2, The difference in mere hardiness among varieties of peaches is, in our estimation, rather slight; and so subject to variation from the influence of soil, cultivation, season, and possibly other causes, that we regard it as nearly or quite useless to take it into account, in the selection of varieties for planting. The difference in hardiness, among pears, is measurably of similar character; although a few, like Seckel, Flemish Beauty, and especially many of our American seedlings, are held to be hardier than the average of European seedlings. Plum trees rarely suffer from the severest Winters, except at the extreme North, unless they have suffered the premature loss of their foliage during the previous growing season—a malady to which they are quite subject—or unless from some cause, they have failed promptly to ripen their young wood. The American varieties, and especially Prunus Chicasa, are free from such tendency and are eminently hardy, although they lack somewhat the luscious qualities of the common garden plum, Prunus domestica. In apples the difference in hardiness is greater, and more distinct, although it seems to follow no recognized rules, unless it be this, that Southern varieties are (almost, or quite,) universally hardier, at the North, than the average of Northern varieties. We have never known a variety, originating south of the Ohio River, to prove otherwise than hardy in the climate of Michigan; although Eastern sorts, such as Baldwin and Roxbury Russet, are often seriously injured by the severer Winters. 3. Many of the newer sorts of apples, originating at the Northwest, are designated as "iron-clad;" while some of Northern and Eastern origin may, with more or less propriety, assume this title; among which may be named Fameuse, Northern Spy, Talman Sweet, Golden Russet, Wagener and others. These, however, generally fail on the Western prairies; while few of the Northern varieties (except the earlier ones,) are found successful as we go South.

Color in Jerseys.

H. C. P., Albion, Mich., says: "I am offered a Jersey bull calf two months old of a light fawn color; white underneath and on inside of legs, with black markings about the head. The lower part of the tail is black with a white switch. But when the hair is parted it is dark underneath and the skin is blue, and where the outer hair is white (on belly) it is *darkest* toward the skin and the skin itself is the bluest. In every other respect (except this darkness of the hair) he is a fine specimen. His sire is black with fawn around the mouth and eyes—not a very good animal. His dam (half sister to sire) is a brindle mixed with fawn, two years old and gives eight or nine quarts of good milk daily. Her dam is a fawn with black head markings, six years old and gives 18 quarts daily of good milk. The grand-sire on the sire's side is black. Query.—Is such an animal a good one to place at the head of a herd, or is his blue skin objectionable?"

ANS.—It has been said that "a good horse may be of any color,' and the same has been applied to a cow. But in this popular adage there is something delusive when it is applied to animals of any particular and well established pure breed. In this every characteristic is important; for if the peculiar and established markings are not present it is more than likely that the more essential characteristics will be found wanting. With regard to Jersey cattle there are some points which have become so fixed that they are accepted as infallible guides in denoting the character of the animal. Thus one of the best established points of the breed is a deep yellow skin, and this is so indispensable a requisite that no person who keeps Jerseys would care to keep in his herd an animal with a blue skin. But, then, this blueness of the skin may be caused by the new hair of a darker shade coming through. A young calf changes color at this season, as well as older animals, by the change of the coat; and before a calf with good ancestry is rejected on account of the color of the skin, it should be ascertained if the color really belongs to the skin or is caused by the growth in it of new hair of a black color. The black markings of the parents of the calf would indicate to some extent that this might be taking place. But, after all, the colors and markings of the animals are more like those of a grade Jersey than of a pure-bred one, and the performance of the dam is not that of a really good Jersey. So that it would be wise to examine the calf closely before taking it.

Budding Peach-Tree Seedlings.

F. E. H., Harlan, Kansas, says:—"I have just set a lot of yearling seedling peach trees for budding stocks. As they had grown up with many branches, I cut them back to the ground, intending to train up one strong, clean shoot in which to bud. 1, Was this right? 2, Will they do to bud this season? 3, Will buds of this season's growth do to put in? 4, How high above the ground shall I place the bud?"

ANS.—1. The usual, and we think the preferable, age at which to bud peach-tree seedlings is, as soon as they are large enough to receive the bud, or, perhaps, when one and a-half or two feet in hight; then a few inches of the lower part of the trunk may be cleared of leaves and branches, and the buds be inserted, preferably on the northerly or shaded side. This, at the North, will be better done about August or September, and the buds should be started by cutting away the top above them the next Spring. At the South, we doubt not,

the buds may be inserted earlier in the season and the tops cut away and the buds pushed into growth the same season; or the trees may be budded in the Spring from dormant buds of the previous year's growth, and the buds started by cutting away the tops as soon as they have well "taken." 2 Yes, as soon as vigorous growth is commenced. 3 Buds for this purpose should be taken from the current year's growth as soon as it shall have become sufficiently ripened or hardened, except in case of Spring budding, in which last year's buds must be used. 4 Young stocks will form straighter and finer trees if buds are inserted within three or four inches of the ground, otherwise this is a matter of little consequence, except only that buds will "take" more certainly in the wood of the current year.

The Niagara Grape.

W. A. E., Statesville, N. C., wishing to plant an acre of grapes and having received a proposition from the Niagara Grape Co., to furnish him with vines of that variety on certain terms, asks whether the grape is really a good sort and worth what is asked for it.

ANS.—We have nothing to say as to the method adopted by the Company to introduce their grape. It is not our affair. We believe the Niagara to be a remarkable grape, all things considered. The vine is perfectly hardy at the Rural Farm and of great vigor. Planted last year, it promises to fruit this. The quality of the grape is to our taste better than that of the Concord. From our best information this variety is one of the most prolific of any of which we have any knowledge. We have no information as to how well it is adapted to various climates, soils and situations.

Miscellaneous.

J. N. L., St James, Neb, asks, 1, the address of some one who has Leicester and Cotswold sheep to sell in Illinois or Iowa; 2, how to proceed to recover money left for certain parties in the Bank of England; 3, whether an inclosed powder is gold, and if not, whether it is worth anything.

ANS.—1. I L Neuman, West Jersey, Stark Co., Ill. 2 We do not believe it would pay once out of 1,000, aye, once out of 10 000 times to hunt after the money that is said to be waiting for heirs in the Bank of England. Still, if a person insists on spending money in the vain pursuit we advise him to trust the matter to an honest lawyer; first, because an honest man will be benefited by the undertaking anyhow; and, second, because in some places the fortune-hunter is likely to give up his pursuit in despair if he defers the spending of money on it till he discovers an honest lawyer to handle it. 3 The sample is iron pyrites, or sulphide of iron. It is of no value itself, unless it is found in large beds, when it can be employed for the manufacture of sulphuric acid. It often *accompanies* gold, and its discovery would justify an assay of the rock containing it, to see if gold is present. The sample sent was too small to assay.

W. C. L., Homer, N. Y., says, "The seeds from the RURAL Free Seed Distribution are received. Among them are two kinds of asparagus seeds and our liking for asparagus would lead us to give these seeds a good place in our garden and good cultivation if our experience with it in the past were not so disheartening. Some years ago we purchased seeds of Conover's Colossal, treated them as directed, not forgetting a heavy coating of manure in the Fall and a top-dressing of salt in the Spring, and were rewarded by large, tender stalks: but when cooked what was our disappointment to find they were as bitter as quinine. Not liking to give it up so, we cared for the bed another year, giving it a covering of manure in the Fall, but the next year it was the same, and we plowed it up. Now what shall we do? Have you heard of any one having a like experience and, if so, is there a known remedy."

ANS.—We should be pleased to hear from some of our asparagus growers respecting the above. The bitterness may arise from some peculiarity of the soil, and we could only advise trying another part of the farm or garden.

M. H. R., address mislaid, has a valuable cow that lately bruised her hip so badly that the skin was broken through and the extreme point of the hip-bone broken. The skin opens of its own accord and the uncovered bone is about two inches across. The animal is quite healthy and hearty, without any lameness, but there is an unsightly break in the hide, and our inquirer asks how to get rid of it, as it does not seem to heal.

ANS.—Keep the animal perfectly quiet in her stall until the wound has healed. If any pieces of broken bone remain, remove them. Once a day spray the wound with a solution of sugar of lead, one drachm to three of water, and, while the wound is wet, dust on it a powder made of pulverized gentian root, one ounce; alum, one drachm. This will unite with the moisture and form a crust on the face of the wound, protecting it from atmospheric influences.

L. M. N., Kalamazoo, Mich., asks, 1, whether the pinks sent out in the Free Seed Distribution will live out-of-doors without protection in the Winter; 2 referring to the statement made some weeks back in the RURAL, that J. M Thorburn & Co. control the entire sale of the White Elephant Potato, we are asked how comes it that two named parties—one in Indiana and the other at Albany, N. Y.—offer it for sale.

ANS.—1. We should prefer in your climate to protect them a little. They are hardy here. 2. It is quite true that Messrs. Thorburn & Co. control the sale of this variety of potato. Any firm or person, therefore, offering the genuine White Elephant for sale must have purchased it from them.

W. A. H., Carlisle, N. Y., asks for a recipe that will keep horses, cattle and hogs in good condition without pampering them.

ANS.—Give regular feed of good quality and generous in quantity together with well lighted and clean quarters. Throw physic to the dogs and give your animals a chance to keep well; when they are sick, it is time enough to call on experts for advice. No powder or other medicament will keep domestic animals healthy without this care, and with it they are not needed.

J. C., Homer, N. Y., asks whether Fall-sown rye can be cut twice this Summer for hay or to be used instead of hay.

ANS.—Rye cannot be cut after the seed stalk has appeared, and make a second growth that will be worth anything. If it is very luxuriant and thickly sown it may be cut before the heads are formed and will then make a second growth: but a larger yield will be procured by cutting the rye when full-grown and just as the blossom appears than by making two cuttings.

J. M. M., San Antonio, Texas, asks at what velocity should a blower revolve which has eight fans 3x4 inches, and is 11 inches from center of axle to end of fans, to give a blast equal to that of a blacksmith's ordinary hand bellows, worked as it usually is.

ANS.—It depends greatly upon the shape of the fans and the angle of inclination, also upon the fixing of the fan. Three hundred revolutions a minute ought to produce a much stronger blast than a smith's bellows.

A. C. B., Warren's Corners, N. Y., sends two samples of oats which agents are there selling as White Russian Oats, and he asks which specimen (if either) is the genuine White Russian.

ANS.—No. 2 more nearly resembles those we sowed. They were purchased from D. M Ferry & Co., Detroit, Mich., which firm is, we believe, headquarters for the variety.

D. M. L., Okolona, Miss., asks how to train and trim tomato vines so as to make them fruit well—his usually run to vine without bearing much fruit.

ANS.—The tomatoes are planted in soil that is too rich. They do not need training or pruning unless confined to arbors If tied to stakes branches may be cut off as needed.

M. B. H., Canandaigua, N. Y., asks, 1, whether the Rural Branching Sorghum will seed after it has been cut, and, 2, after the seeds are ripe will the stalks be good for fodder.

ANS.—1, No, not in this climate. 2, As good as or better than those of Indian corn.

G. G., Dayton, Texas, asks if picotees, carnations and pinks will transplant, adding that they have come up very thick.

ANS.—Yes, very readily. If permitted to remain so thick they will soon become "drawn," feeble and worthless.

C. A. R., Tallahasee, Fla., inquires as to the proper time to cut Hungarian Grass.

ANS.—We have sown it the present season for the first time, and therefore cannot speak from experience. It is said that it should be cut while in bloom.

C. C. M., Danby, N. Y., asks where sheep-shearing machines can be obtained, and whether they are a success.

ANS.—American Shearer Co., Nashua, N. H. The machines are used to a considerable extent and in practiced hands are successful.

J. H. S., Carthage Landing, N. Y., sends insects for name.

ANS.—Hairy necked Leaf-eater, known to entomologists as Phyllophaga pilosicollis.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, MAY 21.

Mrs. W. R. S.—J. O.—Miss R. G.—J. J. C.—Mrs. S. H. H.—S. A.—J. B. L., many thanks—J. B.—A. L. C.—C. H. D.—M. W. F.—W. H. I.—F. M. H.—G. E. G.—K. C.—G. C., M.D.—H. C. B...L. B. A.—L M. N.—M. B. P.—J. Implements and Machinery.

BUCKEYE CULTIVATOR.

A NEW
Senior Buckeye
RIDING
CULTIVATOR,
For 1881.

A NEW
Junior Buckeye
Riding and Walking
CULTIVATOR,
For 1881,

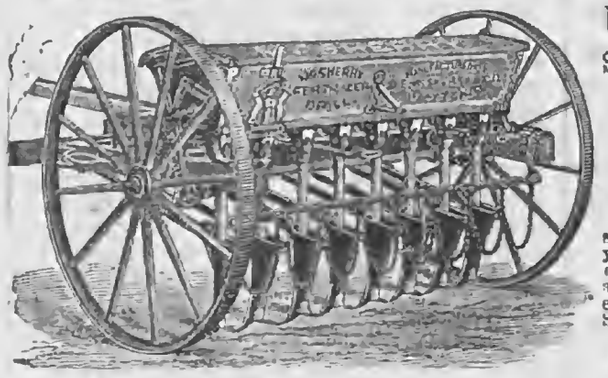
Have many New and Important Advantages.

The most Complete Corn Cultivator in Use.

They have four or six Shovels for Corn, or five, six or seven for shovels Fallen, and they are the best Fallen Cultivators in the market. They have the Patent Rotary Shield and Foot Treadles for raising the Shovels.
Our new Buckeye Walking Cultivator for 1881 is complete and will suit the most particular. The Buckeye Junior and Buckeye Walking Cultivators are furnished with wood or iron beams as desired. See our agent near you or send for descriptive circular of Drill and Cultivator.

P. P. MAST & CO., Springfield, Ohio.
Branch Offices—216 North Broad St., Philadelphia, Pa., and 11th St. and Clark Ave., St. Louis, Mo.

McSHERRY GRAIN DRILL.



UNQUESTIONABLY THE BEST
Sows Fertilizers Splendidly,
It is very Accurate,
It Regulates by Cog Wheels,
It is Light Draft,
It is Easily Managed.

It is strictly first-class in workmanship and construction. Works to the entire satisfaction of everybody who knows what a grain and fertilizer drill ought to do. Its sterling qualities have gained it a world wide reputation, and all who appreciate excellence and accuracy prefer the McSHERRY. Send for pamphlet. Mention this paper.

D. E. McSHERRY & CO.,
Dayton, Ohio. U. S. A.

The Monitor Self-Dump Rake.

Of all the Rakes that I ever saw rake, I never saw a Rake rake as this Rake rakes! That is what they all say.

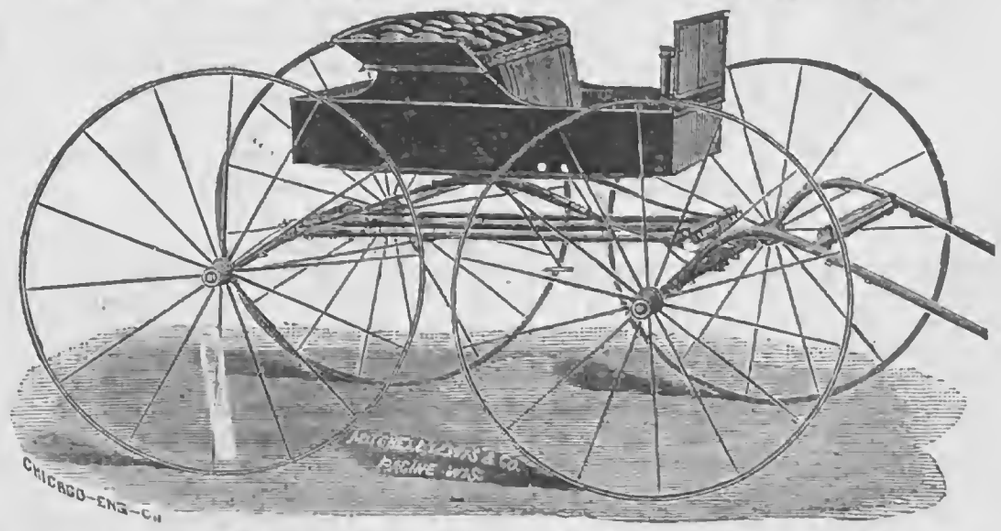
Send for Circular.

HIGGANUM M'F'G CORPORATION,
Higganum, Conn. U. S. A.

Mitchell, Lewis & Co., Racine, Wis. U.S.A.

MANUFACTURERS OF

FARM AND FREIGHT WAGONS



Platform Spring Wagons, Three Spring Wagons, Four Spring Wagons Open and Top Buggies, Phætons, Sewing Machine Wagons, Buckboards.

The MITCHELL WAGON is Monarch of the Road, only the very best stock used in its construction and made by the best wagon mechanics in the world. The Spring Wagon and Buggy Department is entirely separate from the Farm Wagon shops. And for the manufacture of this class of work we have facilities unsurpassed. Send for Catalogue and Illustrated Price List.

MITCHELL, LEWIS & CO., Racine, Wis.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, MAY 28, 1881.

The Regular Plant and Seed Distribution of the Rural New-Yorker, announced in our Fair Number, is now closed. We can still send most of the kinds offered, however.

The Rural New-Yorker begs to offer in articles of its own selection, for the longest and heaviest five heads of wheat from the next crop, $50.00, to be divided into first, second, third, fourth and fifth premiums. The awards will be published in our Special Wheat Number, and drawings presented of the prize heads.

The Rural New-Yorker of June 11 will be a special cattle number.

The attention of our farmer-readers is called to the article "Notes from the Rural Farm" and the accompanying diagram in another column. Not that they are particularly interesting in themselves, but because they will familiarize them with experiments to which frequent reference will probably be made in the future.

Cotton Planters' Convention.—We are glad to note the increasing interest in the South, in industrial exhibitions. It speaks loudly of that prosperity which Southern planters, farmers and mechanics have hoped for so long and which they are now, let us hope, beginning to enjoy. Last week we spoke, editorially, of the great Cotton Exposition to be held next Fall at Atlanta, Georgia, and now we note another exhibition of a similar nature which is to be held at Memphis on the 25th inst., when all the new inventions and improved machinery for cultivating and preparing the crop for market will be practically illustrated and their merits explained. Such exhibitions of the Southern industries will incite to greater enthusiasm in the great work of redeeming the South from her long period of industrial adversity and will communicate a powerful impulse to the interests of agriculture.

Chestnuts.—As a remunerative crop, chestnuts have not received their share of attention and we presume it will be long ere the raising of chestnut trees is made a part of our rural industries. But may there not be money in it? In some foreign countries the chestnut crop is equivalent to the wheat crop in America, both as respects its money value and the uses to which it is put. Chestnut bread, a thing of which Americans are wholly ignorant, constitutes the principal food of thousands of people in Europe and Asia. The fruit is ground into meal, and puddings, cakes and bread are made from it. Ohio's statistics show that her chestnut crop is valued at $60,000, and it could soon be made to reach ten times that amount. The tree is of quite rapid growth, attaining the hight of 15 or 25 feet in five years from the seed; it is, as we know, valuable as timber; can it not be made more valuable here for its fruit?

There seems no reason why we should not raise the Pyrethrum roseum, from which that most valuable insecticide known as Persian Insect Powder, is manufactured in this country or in some parts of it. The plant is already known to thrive in California, and a company is established there for the manufacture of the powder from its flowers. It would seem that these flowers contain a principle which, though deadly poisonous to nearly all kinds of insects, is yet harmless to man. It has proven as destructive to potato beetles, army, cotton, and cabbage worms as it is to bed bugs, roaches, hen lice and the like. It seems to be, in fact, the perfect insect destroyer, and we have now simply to ascertain where it can be most profitably grown and then to cultivate it in such quantities as will admit of its being sold at a very low price. We repeat the request which we made three weeks ago, that those who have received packets of the seeds from the Rural New-Yorker will give them careful treatment.

High-priced cattle. — Lately there has been quite a large number of auction sales of pure-bred neat cattle in different parts of the country, and prices, as a general thing, have been high enough to satisfy the sellers. Probably the most notable sales have been those of Jerseys in this city, and of Short-horns at Port Huron, Michigan. On the 5th inst., the Maple-Shade herd of Jerseys, the property of Mr. John D. Wing, sold here, brought the unprecedented average of $517.32 on 46 head, the top price being for the pure Alphea bull Polonius, which was bought by the proprietor of Alma Farm for $4,500, the highest price ever given for a Jersey bull; and at last week's sale Leda bought $3,000, the top figure ever given for a Jersey cow. High as are these prices, however, they are greatly exceeded by those given for Short-horns at the Port Huron sale of May 18, where Airdrie Duchess the Tenth, brought $7,525; Airdrie Duchess the Second, $7,000; and Airdrie Duchess the Eleventh, a mere calf, $5,055. These prices may be considered fairly indicative of the value placed by the public on the best specimens of these two breeds, as the Alphea family is now considered to embrace the best type of Jerseys, and the Airdrie branch of the Duchess family, owing to the decadence here of the pure-bred Bates Duchess tribe, is generally considered second to no Short-horn strain among us.

OCEAN CATTLE TRANSPORTATION.

Last Wednesday a cablegram announced the decision of the English Courts against the legality of carrying deck loads of live stock on the Atlantic steamers. Henceforth shippers will be without compensation when their stock are either washed overboard in stormy weather, or cast overboard for the safety of the vessel and the rest of the cargo. In ordinary cases, when one part of the load of a vessel is jettisoned to lessen or remove danger to the vessel and the rest of the freight, the loss is made good by levying a contribution on the gross value of the ship and cargo at risk, and saved by the sacrifice. As the carrying of stock on deck is now declared illegal, nothing can henceforth be collected, by this system of general average, for losses voluntarily incurred to lighten the vessel or adjust the cargo; neither can insurance be collected in Great Britain on stock accidentally washed overboard. The underwriters of this city have lately condemned the practice of carrying cattle on deck in the Winter months, on account of the great risk thus incurred, but except in July and August there is not a month when deck loads of cattle are not likely to be either greviously injured or washed overboard during rough weather on the Atlantic. Humanity therefore, should be congratulated on this decision.

A twin barbarism, however, and one more flagrant during the heated Summer months than at other times, is the packing of beasts between decks in ill-ventilated, over-crowded quarters. Animals weltering below in such places suffer as much from the heat of Summer as do those shivering on the weather deck from the cold of Winter. Moreover, the flesh of animals that cross the Atlantic cooped up in a half-poisonous atmosphere, and which have to be slaughtered soon after landing, can hardly be healthful. Some of the heaviest losses incurred by shippers of live stock have been due to defective ventilation on steamers ill-adapted to the trade.

GAMBLING IN LIFE—A NEFARIOUS BUSINESS.

Northern Maryland and Southern Pennsylvania are just now violently agitated on account of a large number of novel life insurance companies that have lately started in business there, and are doing a "roaring" trade. One of these impecunious concerns having once obtained a charter, straightway floods the surrounding country with glib agents who find little difficulty, during the present "craze," in persuading sharpers and nincompoops alike to take out policies on the lives of some of their acquaintances or even of strangers who are likely to die soon. The companies are gotten up on what their organizers term the "mutual benefit" plan—a plan which must confer a benefit on themselves, however disastrous it may prove to the insured and the insurers. Whoever holds a policy in any of the concerns is assessed a sum proportioned to the amount covered by this policy, on the death of any one insured in the company. From this contribution the amount of the policy is paid, leaving a snug bonus for the managers of the institution. As fifteen thousand dollars is the greatest risk taken by any of the concerns on a single life, some persons who have risks covering from fifty to two hundred thousand dollars on one person, are policy-holders in quite a large number of companies, and as deaths must occur frequently from the very nature of the risks taken, the assessments must be onerous in many cases.

It is therefore of the first importance to the insurer that the "subject" insured should be as short-lived as possible both to escape assessments and to pocket the insurance. Accordingly the whole "afflicted" region is being ransacked for good subjects—tottering old men and women from seventy-five to eighty-five and the moribund of all conditions who cannot possibly survive long. Many of the best subjects—those whose deaths have already enriched the holders of policies on their lives—were inmates of alms'-houses, decrepid wretches who for years have been supported by public charity. Quite a large number of the "best" people of the region—laymen and clergymen—are said to be connected with the companies as policy-holders, agents or organizers, and not a few of them must wish, if they pray not, for the "translation" of some poor old wretched stranger whose death will confer on them riches he never owned in life. This nefarious mode of gambling is spreading; it is provocative of recklessness, thriftlessness and murder. It is against public policy and the welfare of the community, and it is therefore the duty of the legislature promptly to suppress it.

WANTED:—A COMPLETE DICTIONARY OF THE ENGLISH LANGUAGE.

The question is perhaps an open one whether it is more or less creditable to American scholarship that a discussion about the making of dictionaries should appear in the columns of an agricultural newspaper. The very fact of such discussion points emphatically to the general intelligence of the agricultural community, for most certainly the Rural would make no allusion to such a subject unless we were well assured that large numbers of our readers would be interested in it. But on the other hand it must be said that if the dictionary-makers were fully up to the times and did their whole duty, there would be little need of criticising or discussing their work.

This train of thought has been suggested to us lately while browsing in the new edition of Worcester's large dictionary, where, without the least intention of seeking out imperfections, we have noticed the absence of several words which unquestionably ought to have been included. Some weeks since we objected to a misleading definition of the word ensilage. We wish now to call the publisher's attention to certain other imperfections which have obtruded themselves upon us. We note the absence of the words *resting-spore*, *stage fright*, and *self-contained*, (as said of men, and, by the Scotch, of houses). Neither "hectograph" nor "London-purple" is given, though papyrograph and Paris-green are both mentioned. Curiously enough, one of the most familiar words of Old England, "*rod*," is not defined in the English sense. For many generations, the rod with which most European children are punished is not a single switch, as with us, but a collection of several twigs. It is a small handful of twigs, as it were, fastened together with twine at the butt. It is strange, indeed, that Worcester makes no allusion to this meaning of the word.

The term "graded," as used with regard to cattle is explained, but we find no special reference to graded schools. "Blue-joint" is defined as a kind of grass (etc.), and perhaps the term as thus corrupted, is used in some localities, but it should have been explained that the true name of Calamagrostis Canadensis, is blue joint-grass, that is to say, as every intelligent farmer knows, it is a joint-grass whose purple blossoms suggested to our ancestors the idea of calling the grass blue. There is nothing blue about the joints of this grass.

We infer from the foregoing examples, which have come to us spontaneously, that there is real room for improvement in the newest of our dictionaries. And it seems to us very desirable that the publishers of both Worcester and Webster should issue frequent supplements and sell them by themselves, apart from the old stereotyped dictionaries proper. It would, of course, be a very expensive matter to prepare a new edition of a great lexicon, but the cost of manufacturing a supplement is comparatively small, and there is scant justice, anyway, in compelling the owner of the old dictionary to buy a second example of it in order to obtain the supplement with which it has been bound up. Since the supplement alone contains all the new words, it is the only part of the "new edition" which is of real value to those persons who already possess an example of the earlier issue.

BREVITIES.

The "California" Privets at the Rural Grounds are killed to the ground.

Now we are putting up 1 800 feet of barbed-wire fence at the Rural Farm just to try it.

Cut out the blooming stalks of pie-plant. In this vegetable we want tender leaf-stalks—not fruit.

Good tools—the most improved implements—do not make energetic farmers. We think they tend to make lazy farmers lazier.

The past Winter—the severest for years—has not harmed peach blossoms in the least at the Rural Farm. Cherry, pear and apple trees also bid fair to produce a large crop.

We wish to thank many friends for the seeds and plants which they have sent to us to be tested at the Rural Ex. Grounds, and regret that the pressing labors of a short season have prevented us in many cases from expressing our thanks by letter.

There is no difficulty in raising tea plants in most parts of the South. The writer has seen dozens of plants in Aiken, S. C, growing under the shade of peaches and pears among the weeds with no care of any kind. The seeds had been planted there the year previous. It was at first supposed that the plant required moist situations, shade while young and a good deal of fussy attention.

As we go to press the following note is received from the Rural Farm:—"The past week has been cold and rainy. Corn comes up yellow, and probably much seed is rotted in the ground. Clover and Timothy fields are looking splendid, and it would seem that a full hay crop is assured. Wheat is making a rapid growth, and most of our many different kinds that stood the Winter, look well, except Silver Chaff, which is rusting badly."

Monday, May 16th, witnessed the opening of a part of the new Welland Canal, connecting the upper lakes with Lake Ontario. By this means Canada expects to secure a great proportion of the grain traffic of the West, as the grain, it is expected, can be shipped at lake ports on board ocean-going vessels, which, sailing down the lakes, will pass Niagara by way of the canal, and then find their way to sea by way of Lake Ontario and the St. Lawrence.

Prohibition meets many obstacles in Illinois. The order of the Mayor of Springfield, that all the saloons in the city should be closed on the 15th inst. (Sunday) was violently opposed by a mob assembled at Lincoln Park. The halcyon days of temperance are still in the future and an earnest, aggressive, unyielding policy, only, can advance the cause. This outspoken opposition to legal authority, in a matter involving the best interests of an order-loving people, should meet at once with their earnest protest in public assembly and at the polls.

It is a good plan to tie about tomato and cabbage plants pieces of card-board to prevent the cut-worm from severing the stem near the soil. It is easily done and is a better protection than mounds of earth which, it has been said, cut-worms cannot climb up. This idea is a mistake. We last season placed 25 cut-worms in a hole about eight inches deep, the sides of which were nearly perpendicular. We watched them at intervals during two hours and found that, though many attempts to escape were ineffectual, some were successful.

We have forwarded little gifts to those of our subscribers who kindly interested themselves in the cultivation of the mangel seed sent out by the Rural New-Yorker, and who have sent us their addresses as we requested. We should have been glad to have remunerated, in some small way at least, all those whose names appeared in the list of mangel raisers published in the Rural of Feb 26, but, not being able, even at reiterated requests, to obtain the addresses, which were at first mislaid, of all, we are unable to comply with our own desires.

George Bailey Loring, of Salem, Massachusetts, who last Wednesday was confirmed by the Senate as Commissioner of Agriculture to succeed Gen Le Duc, is in his sixty-fourth year, and in one capacity or another has seen a good deal of public life during the past thirty years. He graduated at Harvard University in 1838 and received the degree of M. D., from the Harvard Medical College in 1842. Seven years afterwards, in 1849, he was appointed Commissioner to assist in revising the United States hospital system, and later on he acted as post-master of Salem. In 1866 and 1867 he was member of the lower House of the Massachusetts Legislature, and served as president of the Senate from 1863 to 1876 inclusive. He has been a delegate to three national republican conventions, and been member of Congress for his district during two terms. He has for the last quarter of a century been prominently connected with agricultural matters in Massachusetts, during which period he has delivered many addresses at agricultural meetings and conventions.

For Women.

CONDUCTED BY MISS RAY CLARK.

SAVING MOTHER.

THE farmer sat in his easy chair
Between the fire and the lamplight's glare;
His face was ruddy and full and fair,
His three small boys in the chimney nook
Conned the lines of a picture book;
His wife, the pride of his home and heart,
Baked the biscuit and made the tart,
Laid the table and steeped the tea,
Deftly, swiftly, silently;
Tired and weary and weak and faint
She bore her trials without complaint,
Like many another household saint—
Content, all selfish bliss above
In the patient ministry of love.

At last between the clouds of smoke
That wreathed his lips the husband spoke:—

"There's taxes to raise, and int'rest to pay—
And ef there should come a rainy day,
'Twould be mighty handy, I'm bound to say,
'T' have sumthin' put by. For folks must die
An' there's funeral bills, an' grave-stones to buy—
Enough to swamp a man, purty nigh.
Beside there's Edward and Dick and Joe
To be provided for when we go.
So 'f I was you, I'll tell ye what I'd du:
I'd be savin' of wood as ever I could—
Extra fires don't du any good—
I'd be savin' of sope, an' savin of ile,
And run up some candles once in a while;
I'd be rather sparin' of coffee an' tea,
For sugar is high,
And all to buy,
"And cider is good enough drink for me;
I'd be kind o'careful about my clo'es
And look out sharp how the money goes—
Gewgaws is useless, nater knows;
Extry trimmin'
'S the bane of women.

"I'd sell off the best of my cheese and honey,
And eggs is as good, nigh about, as the money;
And as to the carpet you wanted new—
I guess we can make the old one du,
And as for the washer, an' sewin' machine,
Them smooth-tongued agent's so pesky mean,
You'd better git rid of 'em slick and clean.
What do they know about women's work?
Du they calkilate women was born to shirk?

Dick and Edward and little Joe
Sat in the corner in a row.
They saw the patient mother go
On ceaseless errands to and fro,
They saw that her form was bent and thin,
Her temples grey, her cheeks sunk in.
They saw the quiver of lip and chin—
And then, with a wrath he could not smother,
Outspoke the youngest, frailest brother—

"You talk of savin' wood and ile
An' tea an' sugar all the while,
But you never talk of savin' mother!"

DESCRIPTION OF CUTS.

FIG. 271.—DRESS SLEEVE OF SILK SERGE.

The upper part is cut open to the elbow and lined with close folds of silk. A thick silk cord is threaded through the serge and tied at the elbow in a bow and ends with tassels. At the wrist a frill of silk.

FIG. 274.—MUSIC STOOL.

The stool is of walnut wood; the top is made of a stripe of embossed velvet worked with filoselle; the colors must be chosen to suit the drapery of the room; the sides are puffings of satin; a very rich furniture fringe finishes the stool.

FIGS. 272 AND 273.—BASKET FOR CLOTHES-BRUSH.

The basket is of very fine wicker, in the form of a cone; it is ornamented with an embroidered drape, which may either be finished with a narrow furniture gimp or tufts of crewel; the bottom is covered with silk, which is drawn to a point at the end, and finished by a tassel; the top is ornamented with two woolen tassels and a rosette.

THAT BOY.

REV. MR. VINCENT of the Chautauqua Institution, has been delivering lectures in this neighborhood, the subject of one of which was the above heading.

FIG. 271.

Being indisposed I did not hear him, but had I known the subject I should have strained a point and listened, for I take a deep interest in "that boy." The great question with me is, what shall we do with him? One of the ancient wise men was asked, "what ought boys to be taught," his reply was, "that which they are to practice in after life."

Are there any wise men of the present age who can give a better answer? *Our* wise men, whether they assent to this doctrine or not, certainly do not practice it. They seem to hold that the children of the State belong to the State, and that as such they are entitled to a *literary* education at the State's expense, or rather that the property of the district shall be taxed for building and furnishing the school house, paying the teacher and providing the fuel, and in certain cases, furnishing the books. The reasons given for this (to say the least) arbitrary legislation is, that by this course the children make better citizens, that the tax paid for their tuition is fully compensated by the

FIG. 272.

FIG. 273.

consequent reduction in the tax for the punishment of criminals and the support of the poor.

Very good logic if it were only true. The first necessities of life are food, clothing and shelter, and a knowledge of the means for procuring these prime necessities is of the next first importance, and why should not the State take this matter in hand as well as the more showy but less solid literature? The late Col. Crockett thought that as far as book learning was concerned, "the three R's, reading, riting and rithmetic," was all that was necessary, but so far as spelling was concerned, he thought common sense better than silent letters, and his instructions to the compiler of his autobiography was not to change his orthography in any case. Had the Col. lived in the present age of spelling reform, who knows that he would not have been the standard?

He held to another principle also, "to teach the young idea how to shoot," and when we consider his isolated pioneer life and that his rifle was his protection from his biped and quadruped savage neighbors and that it was the means of procuring food for his family, who shall say he was not right? The Col. was certainly a man of *mark* and if I recollect aright, he was sent by his neighbors a representative to Congress.

Now, this is an extreme case, but is it any more so than a smattering of foreign and dead languages with the higher mathematics and other studies that are termed scientific but which are not thorough enough to make either of them a business for life? They are just enough to disqualify the man for any more ordinary occupation by which he can earn a livelihood for himself and the family he ought to have and support. Don't accuse me of speaking disrespectfully of the study of the foreign languages, or of any scientific or literary studies; if acquired they are useful or may be made so in every occupation, but a very important question to be raised while pursuing them is, what are you going to do with them when acquired?

It is not always the most illiterate that are the most vicious, it is not the dunce alone who steals our fruit and robs our harvests, it is more often he who knows no legitimate business with which he can obtain an honest living. The man who counterfeits coins and bank notes is a man of science, and he who contrives to blow up a ship with dynamite in order to get the insurance he had obtained on a box of worthless stones, was not an ignoramus.

Five to ten years ago I should not have dared to risk what reputation I have for patriotism, by assailing the Free School Law, but for the past two or three years I find it severely criticised by men much higher in the scale of philanthropy. The man who lives in a graded district and owns merely a simple shelter for his family, and whose children are obliged to work as soon as able, is willing to be taxed for the teaching to them of the rudiments, but winces when he learns that a part of the tax he pays, goes to pay for the tuition of his rich neighbor's sons in the higher branches, and to fit them for college. The man who has educated his children under the old Rate Bill system and is now taxed severely to support Free Schools, the pupils of which steal his fruit if not protected and damage his exposed property because it is not all free like the schools, wonders if this is the "value received" he was promised under the newer law.

I miscalculate the reports of the newspapers, get wrong impressions from what I see, hear and suffer, misinterpret the signs of the times, if every species of crime, especially juvenile depravity, has not increased since the passage of free school laws. I would not swear that free schools are the authors of vice but that they have not been the cause of the promised reform I can affirm. It is a maxim as old as history, that that which costs neither money or labor is never very highly prized.

VIEILLARD.

LITTLE COMFORTS.

"You are the first woman I ever saw, aunt Phœbe, stop in the midst of dinner getting, that, too, when you are belated, and rub off a stove."

"It has not taken me three minutes, Susy, with this stove polish powder, and how much better it looks and how much better I feel. That spotted stove hearth was a hindrance to me every minute. It annoyed and confused me. Now I can go ahead with vigor, just so I have often cleared up a table nice and clean before I began to wash my dishes, for my own comfort while I was working. 'Follow things that make for peace' in your own mind as well as in the family. I often think of the advice of a good old lady who had been a working woman. 'Take comfort, girls, take comfort.' If I had my life to live over again I would take more comfort as I went along.

"Happiness turns on very little hinges and trifles that hinder it are worth putting out of the way. Every thing cooks better for me, on a clean stove; or I think it does, which is the same in effect. I know that I can work better and faster if my mind is not every minute taking exception to my surroundings. Some days when work drags and I feel generally out of sorts, I often go up to my room and put a drawer or a set of boxes in the very best order, perhaps bringing down some crumpled linen or laces and freshening them up, laying them over a chair in dainty array; this makes me feel in better spirits right away. Better still is the effect when I take my little garden tools and go out for a half hour among my flowers, loosening the earth about the roots of my darlings and nipping the head of every weed that shows itself. The fresh air, the sweetness of the flowers, and the tidy garden beds all conspire to chase away the low spirits that will sometimes creep over us all. Sacrifice to the spirit of neatness and good order, and you will always find you have been the gainer. Every time I look at that shining stove hearth it gives me a quiet satisfaction, which is an element of happiness. You will always work better and swifter if you are happy. Yet how many busy women would despise such little self-indulgences as something almost childish.

"Don't be afraid, Susy, to take all the comfort you can get out of life, and be content to take it as the sparrows do their food, a crumb and a seed at a time. Great causes of happiness are few and far between in this world, but little comforts may almost always be had for the taking." OLIVE GRAY.

HINTS ON CALLING.

Do not stare around the room.
Do not linger at the dinner hour.
Do not lay aside the bonnet at a formal call.
Do not fidget with your cane, hat or parasol.

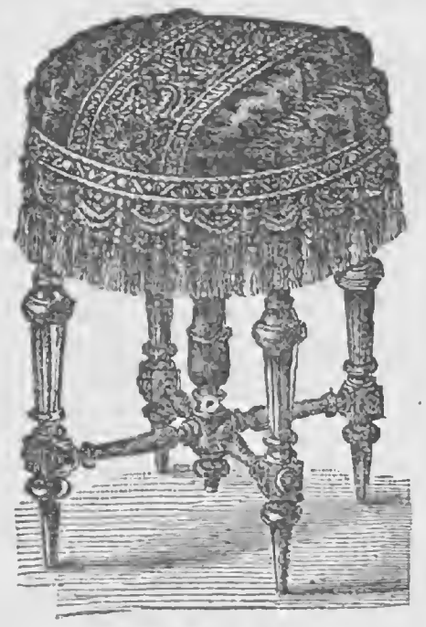


FIG. 274.

Do not make a call of ceremony on a wet day.
Do not turn your back to one seated near you.
Do not touch the piano unless invited to do so.
Do not make a display of consulting your watch.
Do not handle ornaments or furniture in the room.
Do not go to the room of an invalid unless invited.
Do not remain when you find the lady on the point of going out.
Do not make the first call if you are a new-comer in the neighborhood.
Do not open or shut doors or windows or alter the arrangements of the room.
Do not enter a room without at first knocking and receiving an invitation to come in.
Do not resume your seat after having arisen to go, unless for important reasons.
Do not prolong the call if the room is crowded. It is better to call a day or two afterwards.
Do not tattle. Do not speak ill of your neighbors. Do not carry gossip from one family to another.
Do not, if a gentleman, seat yourself on a sofa beside the hostess, or in near proximity, unless invited to do so.
Do not, if a lady, call upon a gentleman, except officially or professionally, unless he be a confirmed invalid.
Do not take a strange gentleman with you, unless positively certain that his introduction will be received with favor.—Hill's Manual of Social Forms.

FASHIONS.

Figured delaines to match and combine with plain ones appear among the Spring novelties.

Embroidery of the finest kind is considered more elegant on mull dresses than lace.

Little puffed pockets of ombre and Bayadere silks are worn, with sashes to match.

Bright gold color, not to say yellow, is one of the most popular shades in dress.

Black costumes are brightened with ombre Surah or Bayadere striped goods.

FIG. 275—MONOGRAM, A. I.

Steel appears as a part of the decorative effects of every dressing toilet.

Mixed black and white feathers are used to trim black rough straw hats.

Gilded bamboo and violet wood sticks are the most popular for parasols.

Tan-colored undressed kid gloves are worn with white costumes.

Sateen or satinette is the most popular wash fabric of Parisians.

Mother Hubbard is the fairy godmother of fashion this Spring.

All young women wear short, untrained skirts on all occasions.

Sashes of ombre ribbon will be much worn with white toilets.

White and pale pink bonnets are most worn at receptions.

Steel and gold are the admired combination this Summer.

Walking jackets never go entirely out of fashion.

Necklets of beads are becoming very fashionable.

Very little jewelry is worn with white costumes.

Pompadour flowered cretonnes are revived.

Pink crape has been revived for bonnets.

Pokes grow larger and larger.

GRAY Summer silk suits are beautifully brightened with collars, cuffs and accessories of Bayadere stripes in shades of peacock blue, maroon, garnet, old gold and steel.

Bayadere striped goods form the cuffs, collars and revers of all dressy costumes of silk or wool in solid colors or cheviot mixtures.

Brocaded stuffs, with the flowers and figures outlined in gold or silver, are used to brighten dark and dull tinted toilets.

CORRESPONDENT'S CORNER.

E. E. Fay, of Mentor, Iowa, says: "Is The American Book Exchange all right? I sent them money more than a month ago. I have their receipt of registered letter, but do not get my books."

ANS.—We have often said in the RURAL columns that they are considered perfectly responsible. They are at times obliged to delay the filling of orders; this no doubt is the cause of non-receipt in your case.

A WAYSIDE COURTESY.—I was once walking a short distance behind a handsomely dressed young lady, and thinking, as I looked at her beautiful clothes, "I wonder if she takes as much pains with her heart as she does with her body." A poor old man was coming up the walk with a loaded wheelbarrow, and just before he reached us he made two attempts to go into the yard of a small house; but the gate was heavy and would swing back before he could get through. "Wait," said the young girl, springing lightly forward; "I'll hold the gate open." And she held the gate open till he passed in, and received his thanks with a

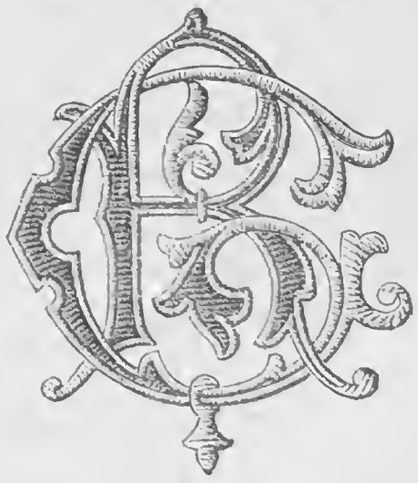

FIG. 276.—MONOGRAM, G. R.

pleasant smile as she passed on. "She deserves to have beautiful clothes," I thought, "for a beautiful spirit dwells in her breast."

[Chicago Western Catholic.]

The latest man who has been made happy through the use of this valuable liniment is Mr. James A. Conlan, Librarian of the Union Catholic Library of this city. The following is Mr. Conlan's indorsement:

UNION CATHOLIC LIBRARY ASSOCIATION,
204 DEARBORN STREET.
CHICAGO, Sept. 16, 1880.

I wish to add my testimony as to the merits of St. Jacobs Oil as a cure for rheumatism. One bottle has cured me of this troublesome disease, which gave me a great deal of bother for a long time; but thanks to the remedy I am cured. This statement is unsolicited by any one in its interest.

JAMES A. CONLAN, Librarian.—*Adv.*

Literary Miscellany.

BRAZOS PETE.

T. A. GERE.

"Say! 'fore you start another dance
Just let me speak a word,
For when the music's goin'
I mightn't p'r'aps be heard,
A sick gal's lyin' in this house
With fever;—awful bad;
And when you swing them hoofs around
The noise 'most drives her mad.

"I heard you tell her mother
'Stuff cotton in her ears,'
And lots of other drunken gab;
Besides, I saw her tears
When she told me that the doctor says
The gal *must* be kept still,
Or else what she's a sufferin'
Is pretty shure to kill!

"So I thought I'd come myself this time
And hint to you galoots,
That if that fiddle squawks agin
Or cornet howls its toots,
And you go prancin' round this room
Like frightened Texan steers
When first they feel the lasso fall,
Why, then, it just appears—

"I'll hev to jine the orchestra;
I'll hev to lead the band:
I play a one-keyed piccolo
With any in the land;
And, if I sound its gamut while
I stand beside this door,
You'll recognize old Brazos Pete,
If you never did afore!"—N. Y. World.

VIOLET'S WAGER.

"Done?" interrogated Dr. Franks, with an amused smile.

"Done," replied his companion, placing her hand laughingly in his.

"It is a foolish wager on my part, Violet," concluded the doctor, kissing her hand with eager tenderness; "for I, above all people, know that there is something about you that no one can resist."

* * * * * * *

"You surely are joking, John? I cannot believe it! You would not, without first consulting me, go and propose off-hand to a girl I have never seen, know nothing about and whom you yourself never saw until a few months ago? And," continued Miss Franks, without giving her brother a chance of replying, "to think of you beginning to talk of love and marriage and all that sort of nonsense, when you will be 36 on your next birthday! You ought to know better!"

"My dear Emily," began John.

"Don't 'dear Emily' me, sir!" interrupted Miss Franks. "I can't be very dear to you when, after keeping your house for more than twelve years, you treat me in such a manner. However, I have no doubt Miss What's her-name will attend to the messages, study economy, and have your interests more at heart than I, who am only your sister, have had."

"I told you I had proposed, Emily; but you interrupted me before you knew whether I had been accepted or not."

"'Accepted or not,' indeed!" said Miss Franks, satirically. "Of course, you're accepted—snapped at."

"Well," remarked John, "I am sure that, when you know my future wife, you will believe that I have chosen for my own happiness;" and, believing that, I know you too well to doubt the reception she will receive at your hands. And of one thing be very sure—I shall never forget your unselfishness, your patient striving for my welfare, your ever-ready sympathy and loving care."

"Don't talk like that, John," said Miss Franks, tearfully; and, taking his face between her hands, she kissed him impulsively, and hurried from the room.

Dr. Franks sat down in a rather disturbed frame of mind. He loved and respected his sister, and was grateful to her; she had kept house for him since he had been in practice, studying his comfort in every way; and he was really sorry that she should feel herself personally slighted at the first mention of his approaching marriage. No idea of marriage had entered the doctor's head until quite lately, when he had fallen desperately in love with a niece of a new patient of his; but he had thought it better to be assured that his love was reciprocated before taking his sister into his confidence.

At dinner, Miss Franks was evidently determined, by an extra display of dignity and ceremony, to efface all remembrance of her previous weakness; but, after a time, her curiosity overcame all other feelings.

"Pray, John, what is this child's name?"

"What child? Oh, I beg pardon! You mean Miss Lloyd—Violet Lloyd."

"Did you say she was seventeen?"

"No," replied the doctor, smiling; "she is twenty-three."

"Oh, no matter! It is very nearly the same thing—she is quite young enough to make ducks and drakes of your money before you've earned it."

"Emily," said the doctor, more sternly than he had yet spoken, "I hardly think it fair, and certainly very unlike your usual self, to form an opinion of a person you have never seen. I am the more hurt at your prejudging Violet, as I had hoped you would remain with us to help her in the management of the house. Of course we cannot expect a 'child' like her to know anything of such uninteresting though important matters."

"No, John, thank you all the same," answered Miss Franks, in a modified tone, without noticing the quizzical twinkle in the doctor's eyes; "such an arrangement would be far from pleasant to me or to your future wife. I shall take lodgings near at hand, so as to be of use to you should you want me."

"I am afraid Violet will be disappointed. She had quite settled that you would retain your own rooms, joining us only when you liked."

"I am much obliged to her," replied Miss Franks, stiffly; "but you know I never get on well with young people."

"At any rate, do me one favor; don't make any arrangements until you have seen her."

"I suppose that means that you wish me to call upon her very soon? When is the wedding to take place?"

"We have not yet decided; but not before the Autumn."

"Of course you have taken into consideration that a wife, and especially a young wife, is an expensive luxury? Or perhaps Miss Lloyd is an heiress?"

"I'm afraid not," laughed the doctor. "Heiresses would not, as a rule, reside in —— Street."

"In —— Street! Do you mean to say that there is where Miss Lloyd lives?"

"Why shouldn't she? The houses are small, 'tis true, but the neighborhood is good; and an aunt and niece would scarcely require a larger house—in fact, I found them their little house myself, about two months ago."

"Two months ago, John! Why, I thought you said they were quite new friends and patients!"

"Well," said the doctor, "you can scarcely call an acquaintanceship of six months a long one."

"Quite long enough," replied his sister, with a grim smile. "Is she an orphan?"

"She is. Her father, an officer in the army, died only a year ago—six months after his wife. Since then Violet has lived with her invalid aunt, who, after our marriage, will go to live with friends."

"Well," said Miss Franks, as her brother rose from the table, "I hope you will not find you have made a mistake when it is too late to remedy it."

"I hope not," he rejoined, quietly.

After the doctor had seen his patients he went, according to promise, to tell Violet how his sister had received the news.

"I am so sorry," said Violet, as the doctor—not very wisely—gave her a full account of his sister's disturbed state of mind. "I suppose it wouldn't do for me to call on her first?"

"I would not do that, Violet: she is ceremonious, and will, I am sure, come here very soon."

"Then," said Violet, lifting her radiant face to his, "let her come, and I will conquer."

* * * * * * *

"Is my sister in?" inquired Dr. Franks when he came home to luncheon the next day.

"No, sir," answered the servant; "I was to ask you not to wait for her, as she might be rather late."

The doctor had just sat down to his solitary meal, when Mr. Shaw, a neighboring practitioner, was announced.

"Sorry to disturb you, Franks," said he on entering; "but I must ask you to come at once to —— Street."

"To —— Street!" echoed the doctor in alarm his thoughts at once flying to the one person that Street contained for him, "What number?"

"No. 17. A lady has met with an accident; and, Franks, I am sorry to say it is——"

"Not Violet?" interrupted Dr. Franks, rising in agitation.

"Good gracious!" thought Mr. Shaw. "Who would have thought he could be so fond of that stiff backed sister of his? My dear fellow," he continued aloud, "Miss Franks will do perfectly well if she is kept quiet. It appears that she was crossing —— Street and was knocked down by a cab. Some one in the crowd recognized her as Dr. Franks' sister; and a lady who was passing insisted on her being taken to her house, where, I fear she will have to remain for the present."

On reaching —— Street the door of No. 17 was opened to them by a neat housekeeper, who asked Mr. Shaw to step into the drawing-room for a moment and then mysteriously beckoned Dr. Franks away. Entering a little snuggery, with which he seemed quite familiar, he was greeted by a warm clasp of soft hands and a kiss.

"Oh, John, I'm so glad you have come! Mr. Shaw says that, though your sister is not seriously hurt, she ought not to be moved; and aunt won't hear of the attempt being made."

"Well, darling," said the doctor, reassuringly, "I will get a nurse for her, and——"

"You stupid old John! Do you think I would let any one but myself nurse her? But I have not told you half, yet. The fortunate part of the affair is, that she doesn't know who I am. She asked me, just now, in whose house she was. I gave her aunt's name, so she is under the impression that I am Miss Matthews."

"Capital!" cried the doctor. "Let me see her at once."

He then proceeded to the drawing-room, and afterwards went with Mr. Shaw to look at the patient. He found there were no serious injuries; but Miss Franks had sustained a severe shock, and it was decided not to attempt to remove her. Although forced to admit the wisdom of the decision she was made terribly peevish by it.

"I shall be a burden in a strange house," she began, as soon as Mr. Shaw left the brother and sister alone—"and all through your Miss Lloyd. I was on my way to see her, when that wretched cabman drove right over me—I believe he did it on purpose. And now, John, I trust to your making arrangements concerning a nurse for me; and if the owners of the house can spare me this room until I can be moved, that is all I want. I must be under no obligation to them, mind; for attention or nourishment, or anything of that kind. I merely wish to be left alone."

"I will see to everything," replied the doctor, "but I am afraid there will be a difficulty about the nurse, for the young person I saw down-stairs seems to have quite made up her mind to attend upon you herself."

"What 'young person' do you mean? Miss Matthews?"

"Oh, is that her name?" said the doctor, carelessly.

"Yes, it is, sir; and I think you might speak more respectfully of people who have been so kind to your sister."

"I am afraid you misunderstood me, Emily. The girl appears very well-meaning and good-natured; but I don't like the idea of her having entire charge of you. She seems such a child."

"Child!" cried Miss Franks. "A more beautiful woman I have never seen; and she's five-and-twenty if she's a day. But there; I suppose you have no eyes for anyone but that baby-faced chit you are going to marry. Had you seen how that 'child,' that 'young person,' has managed everything since I was brought in, and how she has cared for my comfort in everyway, you would scarcely sneer at her and call her 'a child!'"

"I am sure," replied Dr. Franks, with a gravity that did him infinite credit, "I am exceedingly obliged to her, and will thank her personally when I go down."

Miss Franks was seated in a lounge-chair in the cosy bedroom given up to her by her young hostess who had been reading aloud, but, fancying her companion seemed inclined to doze, had let her book fall from her hand, and was gazing into the fire, which, in spite of the soft air of fast approaching Spring, had been lighted for the invalid.

Miss Franks, however, was not asleep, but was looking, with half-closed eyes, at the picture the fitful blaze lit up with rich, artistic coloring.

Violet's rounded figure was shown to perfection by the unstudied grace of her attitude as she leaned back in her low chair, her hands clasped behind her head. Her rich dark brown hair grew low on her broad fore-head, her soft, hazel eyes—in sunlight blue, at night black—seemed ready to brighten to a smile, ready, too, to darken to a grave and tender sympathy. Miss Franks, though naturally a shy woman, was quite at home with her lovely, cheery young hostess, and even allowed herself to be scolded and petted by her to an extent not a little amusing to the grave doctor.

With an impatient sigh, the invalid broke the silence.

"Really, Miss Matthews, I can't allow you to give up so much of your time to me."

"Nonsense, Miss Franks," replied Violet, startled from her reverie. "What have I to do? Aunt sleeps half the day, and her maid is within call; besides making myself useful will keep me out of mischief, as Dr. Franks says."

"It is very impertinent of him," observed Miss Franks; "but I must say he has been most attentive to me. I'm sure I have told him over and over again that I do not need two visits a day; but he will come. I only wish he came to see some one else."

"What do you mean?" asked Violet, innocently.

"Oh, never mind, dear! I won't think of the subject—it is a most painful one to me. Perhaps I may tell you some day, if you care to be bored with my troubles."

To be continued.

NEW PUBLICATIONS.

Hand-book of English Synonyms. By L. J. CAMPBELL, Boston: Lee & Shepard.

This valuable little book will be found acceptable to beginners of literary work and also of much use to those of greater attainments. It has an appendix showing the correct uses of prepositions; also a collection of foreign phrases. Repetition of words may be happily avoided and the proper use of prepositions; correct rendering and translation of foreign expressions learned, by reference to this compact edition of knowledge.

MAGAZINES FOR MAY.

The Atlantic Monthly.—Contents: Some Personal Recollections of Carlyle; Rabbi Ishmael; The Martyrdom of an Empire; The Portrait of a Lady. XXV.-XXVIII; Three Sonnets. I. Nativity II. Circumstances III. Providence; Study of an old Southern Borough; Reminiscences of Washington. XIII. The Fillmore Administration, 1850-53; Friends. A Duet. XI. XII; Eugene Scribe; Lawn Planting for Winter Effect; Dementer's Search; Correspondence with a British Critic; The Head of Medusa, and other Novels; The New Edition of Gilchrist's Blake; The Contributors' Club; Books of the Month.

Harper's Magazine—Contents: I Held Love's Head While it did Ake; Music and Musicians in New York; "Aprille," a poem; Athens; Decorative Pottery of Cincinati; The Indian Girl, a poem; Anne, a novel; The Return Message, a story; The Market Bell, a poem; Camp Lou; The Unexpected Parting of the Beazley Twins: Thomas Carlyle; George Elliot; The Speaker's Ruling; Contrast, a poem; Two, a poem; A Laodicean, Book the Second, Dare and Havill; Editor's Easy Chair; Editor's Literary Record; Editor's Historical Record; Editor's Drawer.

The American Naturalist.—Contents: The Endocranium and Maxillary Suspensorium of the Bee; Mya arenaria in San Francisco Bay; The Squid of the Newfoundland Banks in its Relation to the American Grand Bank Cod Fisheries; The Brain of Embryo and Young locust; Editor's Table; Recent Literature; General Notes; Zoology; Entomology; Anthropology; Geology and Palæontology; Geology and Travels; Microscopy; Scientific News; Proceedings of Scientific Societies; Selected Articles in Scientific Serials.

Lippincott's Magazine.—Contents: Granada and the Alhambra; Zoological curiosities; Craque-O'-Doom; The House of Commons; In Search of a Soul; Oyster Culture; Pringle's Flat; Two Lives; The Indiscretions of Madame Jaubert: The Truth about Florida; A Lucky Misfortune; Our Monthly Gossip; Literature of the Day.

North American Review—Contents: Centralization in the Federal Government; The Old Version and the New: The Needs of the Supreme Court; Utah and its People; Shall Americans Build Ships? The Life-Saving Service; The Ruins of Central America, Part VII; What Morality Have We Left?

Scribners', St. Nichol as, The Young Scientist American Antiquarian Journal, Appletons' Journal, Musical Herald, Godey's Lady's Book are among receipts, contents of which are not given. The character of the productions is as well sustained as usual. Lateness of insertion will not warrant more extended notices.

Sixty-eight towns and cities of the Republic made last year weekly death reports to the National Board of Health, which, after aggregating and tabulating them, has published the results. These show that Vallejo, Cal., was the healthiest place reported in 1880, and Norfolk, Va., the unhealthiest. The average life in the former town is set down at 83.6 years—certainly an extraordinary figure—and but 1 person in each 1 000 of the population—the entire number of the inhabitants is about 2 000—died there of consumption. The average life in Norfolk was 27.9 years; and 1 person out of each 241 died of consumption. The entire population of the 68 towns was 7 359 937; the the average duration of life in them was 44.5 years; deaths of consumption, 1 to every 326, and from acute pulmonary disease, 1 to every 829. Or out of every 100 deaths 24.4 were from pulmonary causes, 14 of them from consumption, and 10.4 from acute affection of the lungs. Four of the healthiest cities were Yonkers, in this State average life 70 years; Omaha, Neb., average 68 years; Utica average 67.5 years; Keokuk, Iowa, average 67.1 years. Four of the unhealthiest cities were Jacksonville, Fla., (probably the invalids who go there and die in Winter were included), average 35 years; Vicksburg, Miss., average 34.8 years; Charleston, S. C., average 31.3 years; Savannah, Ga., average 30.6 years. In Boston the average life was 42.5 years; deaths from consumption, 1 in 246; from acute lung diseases, 1 in 326. In New York, average life was 37 years; deaths from consumption, 1 in 254, from acute lung disease, 1 in 314. In Philadelphia average life was 47.8 years; consumption, 1 in 314; acute lung disease, 1 in 844. In Cincinnati, average life was 47.8 years; consumption, 1 in 346; acute disease, 1 in 494. In Louisville, average life was 47.4 years; consumption, 1 in 300. In Chicago average life was 48 years; consumption, 1 in 593. In San Francisco, average life was 51.8 years; consumption, 1 in 295. In New Orleans, average life was 41.3 years; consumption, 1 in 256. In St. Louis, average life was 52.5; consumption 1 in 447; Next to lung disease, diarrheal disorders were most fatal. In every 100 deaths from all causes in the 68 towns, 10 were from those ailments, and there was 1 death therefrom in each 436 of the inhabitants.

BRIC-A-BRAC.

I've a letter from thy dad,
Baby mine, baby mine.
He is feeling awful bad,
Baby mine, Baby mine.
For the place he didn't get,
He is coming back, my pet,
And he'll stay at home, you bet,
Baby mine.

Bjornson's publisher: Bjornstone Bjornson, the Norwegian poet, is writing a new book of poems. We have the contract for printing it, and have ordered seven hundred pounds of lower case "j's" for an emergency. One of the poems reads:

"Mjeet mje bjy mjoonlight, mjy djear,
Ojt tjhe njight ajir ajou njeed hjave njo fjear,
Yjou mjay tjhink tjhis ijs ajwfully qjueer,
Bjut tjrust Bjorstone Bjornson, mjy djear."

Wilhelmj willj seljthej abovej to music.—Gate City News.

IN THE SPRING-TIME.

In the spring the gentle tom cat
Takes his station on the shed.
In the spring the thoughtful farmer
Puts his onion seed to bed.
In the spring the gladsome sunshine
Sends fresh hope into the sad.
In the spring a prudent person
Buys himself a liver pad.

In the spring the little song birds
With their music fill the glen.
In the spring the busy housewife
Spanks the boys and sets the hen.
In the spring the bees are bumbling,
Full of business are the ants,
In the spring the average young man
Buys two pairs of striped pants.

PERILS OF HOUSEKEEPING.

Have you paid the milk bill? The wood is out. The stove wants fixing. The night-key is broken. The front door bell wire is loose and the bell won't ring. Get some cat's meat. That cat hasn't had anything fresh for nearly two days. She won't eat cooked meat. The poker is broken. Get some screw hooks for the cupboard. We must buy a new clothes line. The salt is out. Mark's last butter was bad. Must buy somewhere else. Get some wire, oxalic acid, bug powder, and nutmegs. Shall we buy a new parlor carpet? The old one's getting faded. Want a new stewpan. The teapot leaks. Send for the furniture man and find out how much he asks for re-covering the sofa. Buy a new market basket. The old cat has four kittens. How many shall we drown? We suspect our hired girl of stealing the tea. That last half pound went very quickly. Schnapps, the grocer, will persist in giving us coffee which has been ground too long and has lost its flavor. Change him. Somebody's stolen the asu-box again. Fifth in three weeks. Get a paper of tacks. Mrs. Doe borrowed our tack hammer a month ago and has never returned it. The canary bird is sick. Buy a ball of twine, six small screws

and a hatchet. The iceman forgot us to-day. The cold meat and milk are spoiled. The cat persists in carrying her kittens all over the house, and won't s ay in the nursery soap box we fixed for her. Get some naptha. The water-pipe leaks again. More plumbers. Mrs. McGoolish complains to the landlord that the water we use on our window-sill geraniums drips, to the detriment of her window panes below. Our girl has left in a huff. The coffee-pot leaks. The last kindling's too damp. Won't burn. Out of soap. Out of matches. She wants some worsted three shades darker than the last lot, but one shade lighter than the first lot. And so on, and so on, time without end, forever and forever. Is life worth living.

[Kansas City Mail.]

Member of this Department relieved of rheumatism by the use of St. Jacobs Oil, says Geo. W. Walling, Esq., Superintendent Police, New York, in one of our exchanges.—*Adv.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

ANOTHER WEEK FROM MRS. CLAY'S JOURNAL.

ANNIE L. JACK.

SATURDAY.—To-day, while we were busy doing up our work, we had a visit from old farmer Tompkins. He is affable and intelligent, and interested in all good works, but after dinner Celia said to me, in a complaining tone, "Why does Mr. Tompkins put his knife in his mouth so much when he eats his dinner?" Her aggrieved manner was amusing for one so young, and I told her that old people were allowed many of their old-fashioned ways that were not tolerated among a younger generation. I once spoke to an old gentleman on the subject, and he answered me: "Fashion, ma'am, fashion—the difference between cutting with a knife and spearing with a fork." I must own, however, that I am somewhat like Celia, and do not think there was any need of farmer Tompkins using his knife as a shovel, or making a dive at a piece of cheese at dessert with the same implement, then, after lifting it in that way, conveying it to his mouth. Children are very observing, and their remarks often denote more thought than we give them credit for. "I think, mamma," said a little girl lately, "you ought to go to school and learn grammar." This remark was caused by the outspoken child noticing little breaches of grammatical rules in her mother's conversation.

We were talking at table to-day about *frogs* as food, some of our city friends regarding them as a delicacy. I do not think I could be induced to eat them, though my lady friends who do so are very dainty in their food and manner of cooking. Karen brought Mrs. Henderson's Cook Book, and we read the instructions there given for frog manipulation. She says: "Frogs are such a delicacy it is a pity not to prepare them with care. The hind legs only are used. They may be made into a broth the same as chicken broth, and are considered very advantageous diet for those suffering from pulmonary affections. To fry, put in salted boiling water with a little lemon juice and boil three minutes; wipe them; dip in cracker dust, then in egg (half a cupful of milk mixed in two eggs and seasoned with pepper and salt); then again in cracker crumbs. When they are all breaded clean off the bone at the end with a dry cloth. Put them in a wire basket and dip them in boiling lard to fry. Put a little paper on the end of each bone, place them on a hot platter in the form of a circle, one overlapping the other, with French pease in the center. Serve immediately while they are crisp and hot." Such an air of disdain as we all put on at the very recipe, but tastes differ, and it is a good thing for the world that they do.

How enjoyable a Saturday afternoon always seems to me. I think the children will remember all their lives that this day was different to the others—not by its extra house-work, but by the quiet and added neatness consequent on the preparation for the Sabbath. Of course, I have more care than when Janet was here—a real *help*—but we are happier than if depending upon unskilled aid from uninterested people; and I think when there are young girls in a household it is the best and safest course to have them learn the details of housekeeping without the intervention of a servant, and, much as the wealthy ignore the duties of home, it is a fact known to more than the poet Saxe "That wealth's a bubble that comes—and goes." As an old lady I once knew used to say, "'Can do' is easily carried about." The cares of housekeeping are lightened or made heavier according to the manner of the inmates, and if I were to mention three blessings necessary to insure comfort in doing one's own work, I should say, first, a husband and children who are mindful and self-helpful; second, good kitchen appliances, and, third, plenty of soft water in the kitchen. With these "helps" one pair of hands and the little helpers can do a great deal, and if I wished to state the housekeeper's bane in the same class, I should say, first, a smoky chimney and used-up stove; second, untidy men folks, and, the only water for use farther than a stone's throw off. So many women have to work with poor utensils that I am sure Mrs. Lewis's new stove, of which notice has been given in the RURAL and elsewhere, should be in every house, if only to save the back-ache, to which we women are so subject, and which is greatly augmented by the low, inconvenient stove.

ICE CREAM.

CHIEF COOK.

THE ingredients for ice cream of the finest quality are as simple as those for pound cake—only cream (not milk), sugar and flavor. Notice that there are no eggs, no corn starch, no boiling, no nonsense. Take fresh cream. To every quart add a half pound of pulverized sugar, mix these well in the freezer; do not add the flavor till the cream is partly frozen. The freezer (of such size as will hold twice as much cream as you put in it) must be placed in a wooden tub three inches larger all round, and six inches higher than the freezer when covered. Break up some ice to the size of walnuts; set the freezer in and throw in some salt—about one quarter the bulk of the ice. Coarse salt is best, but any kind will do. Fill up around the freezer within three inches of its top when uncovered, with alternate layers of ice and salt in the same proportion as before. Let the cream and sugar stand until they begin to freeze around the sides of the freezer; then begin to beat with an "ice-cream beater, the only tool which will make superior ice cream. This is a tin paddle something in the shape of a spoon, with a stout wooden handle about as thick as a broom handle. The beater may be six inches long by four inches wide. Any tinman who makes freezers can make one.

Set the freezer in its tub where you can walk around it, and beat the cream by a peculiar stroke down the sides of the freezer so as to scrape at every stroke the frozen cream from its sides; continue this till the whole mass is perfectly fine, and until the cream has risen' till the freezer is nearly full. This is the perfection of ice cream making. When so far done cover it up, fill up to the top of the tub with ice and salt as before; lay a blanket or piece of carpet over all; set away in a cool place for three hours to ripen. Then serve generously, as very few people except in Philadelphia, (where this mode is universal) ever get such a dish. Serve two flavors on the same plate, like lemon and strawberry, etc.

Flavors for Ice Cream.

Flavors of all kinds can be purchased at grocers' and druggists' stores, and may be added to suit the taste; a flavor may be too rich but never let it be poor. If lemon or orange juice, or the juices of sour fruits are used, do not add them to the cream till it is half frozen or they will turn the cream sour.

Water Ices.

These are made of the juice of very ripe fruits, such as peaches, plums, pears, apples, cherries, strawberries, raspberries, pine-apples, lemons, oranges and tamarinds. Select fruits having a very rich juice, add sugar to taste, and freeze as for ice cream, except that this will not rise as cream does.

Frozen Fruit.

This is exactly like water ices, except that one portion of the fruit is used to furnish the juice, and another to be cut up into small pieces, mixed in the juice, sweetened to taste and frozen as before. In regard to sweetening frozen confectionary, one thing must be noticed, that is, that cold destroys the sweet taste, and what would be very sweet if eaten warm, would be quite insipid when frozen. This will account for the sickening sweet taste of ice cream which has become melted down in the dish by heat.

Iced Fruit.

Select very fine bunches of grapes, currants, raspberries, etc., etc., on their stems; remove all imperfect berries; dip them in white of egg tempered with water, or weak gum arabic water. Sift finely pulverized sugar over them; set away to dry and then serve. Any larger fruits of rich flavor, such as apples, pears, plums, peaches, may be iced in the same way, whole or sliced into ornamental shapes after removing the seeds. In the hands of a lady of taste in decorating, iced fruit is always a great success on a table.

QUESTIONS ANSWERED.

CAN you tell me the cause and prevention of infants repeatedly vomiting up their food? At first, after nursing, the milk looks fresh and sweet when thrown up, but afterwards it looks like thick, sour milk. The child generally seems well but very fretful. I have heard it said that it is a sign of a healthy child, but I have seen just as healthy children as mine who never throw up their milk. It does not seem comfortable for the child to do so, besides being very uncleanly. My babe is six weeks old and every hour that she is awake she vomits up her milk more or less. I have had eight children and they all have done the same until they were six months old, when they begin to substitute other food for breast milk. For ought I know, I work and eat as other mothers do so I cannot see why my children should be so troubled.

ANSWER BY T. H. H., M. D.

It is impossible to make a positive prescription without seeing the case. A few questions to the mother and an examination of the child would give a clear view not attainable otherwise. The most frequent cause of vomiting the milk is the pernicious custom of giving the child the breast too frequently and irregularly. Mothers say it is done to stop crying, and take the cry as a sign of hunger, when really it may be due to repletion, or colic caused by over-feeding, or too frequent feeding. The children of vigorous families, inheriting strong digestive organs will suffer little, perhaps, from this bad method, while more delicate infants are got into a bad condition very soon, and lay the foundation of a poor digestion and life-long ailments in consequence of irrational nursing. Once in three hours is often enough to nurse a child. After six months one nursing in the night is enough. Above all things, don't suppose that every time a child cries it must be put to the breast. The vomiting is nature's way of relief and in that sense it is "healthy." *Don't* use "soothing syrups."

Kidney and Urinary complaints of all kinds permanently cured with Hop Bitters.—*Adv.*

The Literary
Revolution.
To keep in good humor the good people who delight in good books; to wake up the slow booksellers who are inclined to go to sleep in the summer, instead of, like a 'possum, in the winter; and to prevent our friends, the Cheap Books. book publishers, from forgetting us, we have concluded to publish a few more cheap books. If we are to name him at all, we must, of course, head Shakespeare the list with the immortal Shakespeare, and will give you either his "Merchant of Venice" or "Hamlet," or any one of his fourteen other principal plays, in beautiful type, for 3 cents. At the same price you may have Three Cents. Macaulay's "Life of Frederick the Great," former price $1.25, or Carlyle's "Robert Burns," or Lamartine's "Life of Mary Queen of Scots," or Thomas Hughes's "Manliness of Christ." Washington Irving's wonderful, delightful, heretofore inaccessible "Sketch Book," which contains the incomparable Rip Van Winkle, you can have for a dime. For the same price we will give you "Tom Brown at Rugby," the best boy's book ever written, except "Robinson Crusoe," which you can have also for 10 cents. To charm those who delight in fiction, we give also for 10 cents each, Cooper's "Last of the Mohicans," one of the most justly celebrated American novels, and Charles Kingsley's "Hypatia," which worthily ranks at the very front of famous historical fiction. These are only specimens of the cheap books we publish, are all in good type, neatly printed, and are not in the broad side or any other "side" or "square" style, but handy pocket volumes, of course in paper binding. Our motto, however, has always been that a book worth reading is worth preserving, as well as worth owning, and our large list of standard books, to which we are making additions, with speed unprecedented in the history of publishing, are all elegantly and strongly bound, in cloth or better style, and sold at prices proportionately low with those in paper covers. We issue these few only in pamphlet form, as specimens of the quality of our good literature, and these special terms will not be long continued. 5,000 Booksellers throughout the United States and Canada are prepared to either abundantly supply or liberally slander our publications. We give liberal terms to clubs where no bookseller acts as agent. Descriptive Catalogue, and illustrated pamphlet describing book-making and type-setting by steam, will be sent free, on request. AMERICAN BOOK EXCHANGE, 764 Broadway, New York. JOHN B. ALDEN, Manager.

News of the Week.

HOME NEWS.

MONDAY, May 23, 1881.

This has been an eventful week at Washington. Senators Conkling's and Platt's resignations, noted here in last issue, threw the political world into quite an uproar, as the action was entirely unexpected. They wrote an extended letter to Gov. Cornell explaining the course they had taken and the reasons for it. The State Legislature has not yet acted upon their communication. On the 18th inst, the long-pending nomination of Judge Robertson to the collectorship of this Port was confirmed, which was considered a victory for the Administration. Salutes were fired in New York, Albany, Hudson, Rochester, Utica and other cities over Robertson's confirmation. On the 19th, the President sent in another batch of nominations including, with two exceptions, those recently withdrawn from the Senate. Mr. Loring of Massachusetts was nominated and confirmed Commissioner of Agriculture, vice Le Duc resigned. On the 20th inst., the Senate rejected the nomination of Wm. E Chandler, as Solicitor-General bya vote of 24 to 14, and at 6 P. M. it adjourned *sine die*.

A small colony of Latter-Day Saints, on their way to Salt Lake City, landed at San Francisco on the 19th inst., from Australia in the steamer City of Sydney. They proceeded to Utah by the first train.

The contract for postal cards, which has been awarded to a New York firm, will result in a saving of $30,000 to the government during the contract term of four years. The number of cards required is estimated at 2,000,000,000.

Both houses of the Michigan Legislature have passed the amendment to the liquor tax bill, whereby the tax on retail sellers of malt liquors is raised to $200, and on distilled liquors to $300. Wholesale malt liquor dealers' tax is raised to $200; distilled liquors to $500.

It is stated that the Interior Department will devote $30,000 to build a boarding school for Indians, accommodating 300 pupils at the agency of the Red Cloud Indians, in Nebraska.

An enthusiastic meeting has been held in Denver, Col., in favor of a national mining and industrial exposition. A committee representing various business interests, was appointed to arrange preliminaries.

The following is a statement in detail of the net annual saving in the cost of star route and steamboat mail service under the administration of Postmaster General James —For the month of March, $215,490; for the month of April, $84,531; From May 1 to May 13, $112,013; total, $412,034. This saving has been effected without in any way crippling the service or curtailing its efficiency, and has been made on exact information gathered by inspectors of the department who have carefully examined the various routes. Much of the reduction is the result of the labors of the commission sent to Memphis to investigate the river service ramifying from that point. A very considerable additional reduction will be made on the 30th of June next, when useless service will be allowed to lapse.

Among the applicants for admission to the bar at Ithaca, N. Y., last week, was Frank Walworth, who was pardoned out of the State prison four years ago, where he was serving a sentence for the murder of his father, on the ground that his physical constitution had entirely broken down. Through strong influence, soon after his imprisonment he was transferred to the insane asylum, on the ground of insanity, but from this he was afterwards discharged, his sanity having been established.

In the Pennsylvania State Senate a resolution was unanimously agreed to and sent to the House for discussion, looking to the transfer of the remains of William Penn from Jordan Meeting-house graveyard, Buckinghamshire, England, to Philadelphia. The resolution also provides that copies be sent to Peter Penn Gaskell, Ireland, and William Stewart, England, representatives at law of William Penn, asking their co-operation in the matter, and requests the co-operation of the President of the United States.

The work of naming and numbering the streets of San Antonio, Texas, was begun recently. Although the city is over 150 years old, but few of the streets have been named, and none numbered.

Utah is just now the chosen field for considerable Christian missionary work. There are forty-four Presbyterian missionaries in the Territory, maintained at an annual cost of $36,000, the Congregationalists are spending $30,000 in new school houses and churches, the Methodists have twenty missionaries on the ground, and other denominations are represented. These tremendous onslaughts have incited the Mormons to renewed zeal.

The revised New Testament was given to the public on the 20th inst. The advanced sale reached 800,000 through the New York and Philadelphia agents. The book is issued in several styles of binding and is sold at from 15 cents to $10 a copy.

A fire involving a loss of $500,000 occurred in Nashville, Tenn., on the 17th. The Western Union Telegraph building was among the first to succumb.

The memorial monument of George B. Armstrong who organized the United States postal railroad service, was unveiled on the 19th inst., at Chicago in the presence of 5,000 people. An oration was delivered by Schuyler Colfax.

Several hundred passengers arrived on one steamer at San Francisco, the other day, from the Australian colonies and Honolulu, nearly all of whom are traveling through America on their way to Europe for a tour of pleasure. This happens frequently, and these travelers spend money freely on the way.

The occasion of the decoration of confederate soldiers' graves at Memphis., Tenn., was characterized by the presence of 6,000 persons gathered to scatter their floral offerings. Casey Young delivered the oration and Miss Olivia Hall read a poem.

"VICTORY!"

Under this caption, a gentleman in Iowa, who had procured the Compound Oxygen Treatment for his wife, writes: "*I am surprised at finding her so much improved in health.* When she began using the Oxygen she could not sit up more than four hours at a time; could not walk a quarter of a mile. Improved from the first inhalation, and now, having used the treatment for six weeks, does considerable work around the house, and can *walk two miles and not be tired.* Raises no more bloody matter. No cough. Sleeps and eats well. All that I can say is, 'Thank God and Drs Starkey & Palen!'" Our treatise on Compound Oxygen, its Nature, Action and Results, *sent free.* Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

THE Wisconsin Legislature has appropriated $4,000 for experiments with Early Amber Sugar-cane.....The next great Texas cattle drive is estimated at 250,000 head with a supplementary drove of 50,000 from the Northwestern part of the State.....In the Smithsonian grounds, Washington, 50,000 bedded plants were set out last year. .....Potato bugs have appeared in such numbers in Bergen County, N. J., as to threaten the total destruction of the crop as fast as it appears. They are to be found on the highways and fences in swarms. They have also put in a numerous appearance in Ulster, Orange and Dutchess, Delaware, Sullivan and Schoharie Counties, N. Y..... A telegram from Oswego, N. Y., on the 18th., says:—The Army worm has made its appearance in this section, destroying all kinds of vegetation. Several fields of grain have been destroyed and hundreds of acres of pasture land have been stripped of every green thing. Reports from all parts of St. Lawrence County indicate that the ravages of the worms extend over the whole of Northern New York. Serious consequences are feared, and many of the farmers are greatly agitated.....

A dispatch from Rhinebeck, N. Y., on the 20th says:—The Army-worm has made its appearance in southern Dutchess County. It is reported that it is doing great damage to vegetation, especially to tomato and cucumber plants and the various early vines.....Another dispatch of same date, from Orange, Sussex Co., N. J., says:—The Army-worm is causing consternation among the market-gardeners of New Jersey, who grow early produce for the New York market. Already the worms are disastrously active, despite the cool weather, and thousands of early plants are destroyed every night, causing heavy losses. The tomato plants are attacked principally.....A telegram from St. Louis on May 19 says:—Reports are received from various counties in the Southwestern part of Missouri to the effect that the fly has already ruined thousands of acres of wheat, and fears are entertained that the crops in that section of the State will be more than half destroyed.....

It has been decided by the English Courts, that to carry deck loads of live-stock is illegal, and that if the animals are washed or thrown overboard no damages can be obtained for their loss from the owners of the vessel, and if they are jettisoned for the safety of the other cargo nothing can be recovered in the way of a general average .....

From sixty-eight to seventy-two per cent. of the total wheat yield of the country is Winter wheat. .....The Hereford breeders propose to hold a Convention at the Grand Pacific Hotel, Chicago, on June 22.....The Delaware Beet Sugar Company has leased 300 acres in favorable locations in Delaware for the purpose of raising its own beets, as farmers seem to take little interest in raising a supply..... To April 20, the entries in the Jersey Cattle Club Register for the current year were: bulls, 1,030; cows, 2,202. The total numbered registered to that date was 17,503..... The new officers of the Jersey Cattle Club are: John D. Wing, New York, President; Geo. E. Waring, Jr., Rhode Island, Secretary; H. M. Howe, Rhode Island, Treasurer; Edw. Burnett, Mass.; Edw. E. Barney, Ohio, were elected directors to serve two years, along with John I. Holly and W. S. Taylor, formerly chosen.....

.....At an auction sale of a herd of Short-horns on May 18, at Port Huron, Michigan, on the farm of Avery, Murphy & Stebbins, about two hundred cattle breeders were present from Iowa, Illinois, Michigan, New York, Pennsylvania, Missouri and Kentucky. Among the highest prices were; $7,525 for Airdrie Duchess the tenth, calved in 1880 by the twenty-third Duke of Airdrie; $3,000 for Airdrie Duchess the fifth, calved in 1874; $7,000 for Airdrie Duchess the second, calved in 1871, and $5,055 for Airdrie Duchess the eleventh, calved in 1881.....According to the schedule of the Illinois Central Railroad tomatoes are vegetables—not fruits, and therefore pay 25 per cent. less freight charges than they otherwise would..... .....Indiana has 103,000 acres of flax, yielding 1,135,000 bushels of seed—or about six bushels per acre —and 156,000 tons of fiber..... Chas. A. Davis, a graduate of the Mich. Agr. College has been chosen for the chair of Chemistry and Mathmetics in the Colorado Agr. College.....Louisiana is threatened with a disastrous flood from the turbid Mississippi.....Since 1871 the grain crops of the United States have been valued at the enormous sum of $10,000,000,000, or an average of $1,000,000,000 per annum. Of this total about one-half, or $5,000,000,000 has been the value of the corn crop, while the wheat crop during the same period has aggregated a value of $3,500,000,000. In the year 1880 the United States exported 144,493,007 bushels of wheat, valued at $171,420,195, and 7,128,164 barrels of flour, invoiced at $39,613,847.....

On May 15th the towboat Oakland left St. Louis for New Orleans with a tow comprising 150,000 bushels of wheat; 200,000 bushels of corn; 5,000 barrels of flour and 500 tons of miscellaneous freight, making in all about 11,000 tons.....On the next day two other tows followed with about 250,000 bushels of grain each..... ....A telegram from New Orleans announces the safe arrival of the Oakland and her tow last Saturday.....The Mark Lane Express (Eng.) of last Monday says: "Dry harsh winds during the week have materially reduced crop prospects. A change, unless it comes shortly, will be too late to save Spring wheat, which begins to look yellow." Altogether the season is among the latest on record.....The bill providing for the adoption of trade marks for dairy products in this State has passed both Houses and was signed by the Governor last Thursday..... A project for building a grand Horticultural Hall is under way in this city. It is said $55,000 have been already subscribed and $10,000 more promised. It is thought that enough to begin operations will be collected by the middle of July.....

The remarkable growth of the beet sugar crop in Europe is made the subject of an interesting article in a late number of the London Grocer. The following exhibits the number of tons of beet sugar produced in former years:—

	1879-80.	1878-79.	1877-78.	1876-77.
Germany.....	411,600	420,700	383,800	291,200
France.....	277,900	422,660	298,100	243,300
Austria and Hungary.	406,400	405,900	330,800	247,200
Russia and Poland....	225,000	215,100	220,000	250,000
Belgium, Holland, etc.	83,600	69,500	88,100	69,500
Total number tons..	1,403,900	1,574,150	1,420,800	1,101,200

In the annual report of the Minneapolis Board of Trade for 1880, attention is called to the fact that actual sales of spot wheat at that city are greater than at either Chicago or Milwaukee..... ... The National Cotton Exchange of America will hold a convention at St. Louis on Wednesday, July 20. Various matters of importance to the trade and planting interests will be considered, among which will be the special reports from exchanges on the subject of selling cotton by net weight..... ....Rail freights on grain from Chicago and Milwaukee to New York are $6 per ton of 2,000 pounds, or 18 cents per bushel of 60 pounds. Lake freights from Chicago and Milwaukee to Buffalo are 5½ cents for wheat of 60 pounds, and 5 cents for corn of 56 pounds per bushel.....The Western Division of the Erie Canal was opened at Buffalo on the 18th inst. Canal freights from thence to New York are, wheat 7 cents and corn 6¾ cents for 60 and 56 pounds respectively. The water rate is 12½ cents on wheat, against 18 cents by rail.....Ocean freights, with increasing receipts at New York, improved, and closed at 3 pence for grain from N. Y. to Liverpool, Saturday.... At latest postal advices navigation had been reopened at most of the Baltic ports.....In Germany, per Hamburg advices, under date of April 30, the weather was still cold, with night frosts. The autumn-sown crops were all backward. Many fields had been damaged by the severe Winter, but complaints were not serious.....The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and seaboard ports, and on rail from Western lake and river ports and frozen in on New York canals, is:—

	1881. May 14. bush.	1880. May 15. bush.
Wheat.....	16,277,622	20,357,348
Corn.....	11,047,188	12,092,167
Oats.....	3,154,761	2,024,787
Barley.....	856,326	636,787
Rye.....	322,909	480,693
Total.....	31,558,806	35,592,382

A cablegram from London announces that the Privy Council has ordered that all cattle from Spain and Portugal shall henceforth be slaughtered at the port of debarkation. Hitherto cattle from these countries were allowed to be sold to farmers and graziers to be fattened after landing, as no contagious disease was known to exist among the herds at home. Now they are put on the same footing as cattle from this country on account of the discovery of foot-and-mouth disease among some of the herds in the Peninsula.....The largest orchard and vineyard in Western Texas is that of D. G. Sabin. He has 9,000 vines, 6,000 of which are in bearing. He has also 3,000 bearing peach and plum trees.....A trial box of Florida oranges from Jacksonville arrived in London in excellent condition after a journey of three weeks. Only three oranges were damaged. The experiment is to be repeated..... .A cotton closely resembling wool has been grown by Burnett Salmon of Oglethorpe, Ga. The seeds were picked up on a vessel from Zanzibar in port at Charleston, and planted out of curiosity.....A Charlottsville, Va., company has just sold to a firm of this city 10,000 gallons of Virginia claret. The Piedmont section and the Eastern slopes of the Blue Ridge promise to take rank among grape-producing districts.....The Farmers' Home Journal of Hardin County, Ky., says gloomily: "Stock of all kinds are thin, hogs dying with the cholera, distemper prevailing among horses, peaches nearly all killed, and wheat crop not promising."..... A Georgia paper says of the devotion of that State to cotton planting: "Simply because all of us are struggling to swell the crop to the largest possible dimensions, under the silly idea that we can make more money out of it, we ruin ourselves, and toil from year's end to year's end without accumulating a cent of profit."..... Judge Travers of the Iowa Supreme Court decides that railroad companies are liable for injuries to animals run over on Sunday, no matter how carefully the trains are operated, because the running of trains at all on Sunday is unlawful.....Lightning singled out a $5,000 stallion to kill at Bloomington, Ill., leaving eleven comparatively valueless horses uninjured. The owner, who had been an earnest Christian, resigned his church membership, and resumed a long-neglected habit of profanity, declaring that Providence was against him anyhow.....The Canadian Pacific Railroad Sydicate advertises its lands at $2 50 per acre, with a rebate of $1.50 on all improved within three years. The government will also reduce the price of pre-emption lands in that section from $5 to $2 50.....Michigan bee-keepers report a loss of 55 per cent. of the stock during the past Winter. .....

Mr. Charles D. Hunter, of the long prominent New York butter firm of Messrs. Hunter, Walton & Co., died this week. Mr. Hunter was well known in this State and for many years personally attended to the country interests of his house.....

A meeting of firms interested in the cider trade was held in this city on May 14, at which it was decided to hold a cider and cider-vinegar makers' convention at Syracuse, on June 7 and 8. To this meeting all interested in this industry are heartily invited..... .The Michigan Horticultural Society will hold its Summer meeting at Benton Harbor on June 7, 8 and 9. Railroads will carry visitors at reduced rates, and the citizens of the town will accommodate all. The convention will open in Antisdale's hall at 7½ o'clock on the evening of June 7, and all delegates are requested on their arrival to repair to the hall and register, when the reception committee will care for them. It is desirable that there be an exhibit of such fruits as may be in season, especially of new and promising varieties. T. L. Lyon is President and Charles W. Garfield Secretary of the Society.

A Reliable Remedy.

Kidney-Wort, not only cures bad cases of piles and all disorders of the kidneys and liver, but is a reliable remedy for a debilitated constitution. It acts on the bowels as a mild cathartic, carrying off the obstructing elements which cause sickness.—Plaindealer.

Thousands of ladies to-day cherish grateful remembrances of the help derived from the use of Lydia E. Pinkham's Vegetable Compound. It positively cures all female complaints. Send to Mrs. Lydia E. Pinkham 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

Sour stomach, sick headache and dizziness, Hop Bitters cures with a few doses.

Cabinet Organs.

There are numerous firms throughout this country who advertise Cabinet or Parlor Organs, claiming superiority from facilities of manufacture, when in reality they never were manufacturers of any portion of an organ, and are simply agents and middlemen for firms who dare not, owing to the inferior quality of their instruments, advertise them over their own names. It is a well known fact that the United States leads the world in the manufacture of Organs in quality of tone, excellence of mechanism and beauty of design, and no manufacturer stands higher in every respect than the Hon. Daniel F. Beatty, of Washington, New Jersey, whose manufactory is now the largest in the world that ships direct. This enterprising gentleman was the first to offer the music-loving populace an opportunity to purchase direct of the manufacturer, thereby saving the public the enormous profits of agents and middlemen. He has made many liberal offers and has never failed to keep every promise and more, we have yet to receive the first complaint from any of our readers who have dealt with him. His last and grandest offer outstrips all others and is an evidence of his unparalleled success The Beethoven Organ is the most brilliant and powerful musical combination ever perfected, and its superiority over all other Organs is attained by the valuable Patent Stop Action held only by Mr. Beatty. The reader should bear in mind that the "Beethoven," which is shipped on one month's trial, has 27 stops, 10 full sets of Golden Tongue Reeds, and is in every respect and detail the finest instrument in the world. The price at which the Beethoven is offered, $60, which includes stool, book and music, must bring it within the reach of every one. It is important that any one desiring one of the Matchless Organs should order and remit at once by a Post Office Money Order, Bank Draft, Registered Letter or Express prepaid. Nothing is saved by correspondence, as the orders for this particular style are coming in so rapidly that the capacity of the Beatty Manufactory is being tested to its utmost, and cash orders very naturally take preference on order book. The feature of this great offer, viz, to refund money sent and pay all freight charges if the instrument is not as represented. Is not this sufficient guaranty of the fair dealing of Mayor Beatty?—*Adv.*

Premature Loss of the Hair

May be easily prevented by the use of BURNETT'S COCOAINE.

HOUSEKEEPERS should insist upon obtaining **Burnett's Flavoring Extracts**, they are the best.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, May 21.

Cincinnati.—WHEAT strong; No. 2 red Winter $1.11@1.12. CORN strong; No. 2 mixed 48c. OATS strong; No. 2 mixed 40½c. RYE in fair demand; No. 2 at $.26. BARLEY dull; No. 3 Spring 92@93c. PORK firm at $16.50@16.75. Lard strong and higher at $10 50. Bulk-meats stronger; shoulders $5 62½; clear rib $8.35. Bacon in fair demand and firm; shoulders $6 62½; clear rib $9 25; clear sides $9 62½. BUTTER easier, but not quotably lower. SUGAR firm; hards 10¾c@10¾c.; New Orleans 7½@8¼c. BUTTER—Fancy creamery sells at 24@25c; prime do at 22@23c; choice dairy at 19@20c; choice Western Reserve at 16@18c; prime to choice Central Ohio 12½@15c; medium 10@12c; and inferior 5@8c. per lb. CHEESE—There is a better supply of prime new Ohio factory and the market rules easier at 10@10½c. and good do is selling at 9@9½c per lb., but inferior has to be worked off at whatever it will bring. SEED—The demand is very light. Flaxseed is steady at $1.10@1.12½ per bushel. German millet sells at $2,25; common millet at $1,50

and Hungarian grass at $1 25. WOOL.—There has been no improvement in the market. The London sales while progressing satisfactorily as to the amount sold, show that lower prices prevail, but not enough lower to materially affect the markets in this country. The sales in the Eastern markets indicate no greater but rather less strength. In our home market there is no demand of consequence from manufacturers, and while dealers are making no effort to buy they are taking the current receipts of the new clip, which are not large, at about the same prices as a week ago. HOGS firm; common and light $4.50@6; packing and butchers' $5 45@6.30.

Chicago.—WHEAT unsettled; No. 2 Chicago Spring, $1 04@1 04¼ cash; rejected, 74@78c. CORN unsettled at 44¼c. cash; rejected, 38c OATS active at 37⅛@37¾c. RYE firm at $1 17. BARLEY easy at 92½@95c PORK firm at $16 45 cash and June; $16 50 July and August. Lard strong and higher at $10 75@10.77½ cash and June; $10.80 July and August. Bulk-meats active, firm and higher; shoulders, $5 60; short rib, $8.40; short clear, $8.75. BUTTER—Creamery, choice, 21@22c.; do. fair to good, 19@20c.; dairy, choice, 18@19c; do. fair to good 15@17c; packing stock, 10@12c; grease, 7@8c CHEESE.—Full cream, new, 10½@11½c; part skim, extra, 8½@9c; do fair to good, 6@7c.; low grades, 3@5c. WOOL.—The market continues dull and listless at our quotations: Good to choice medium and fine, 28@32c; coarse and dingy tub, 33@37c; fine and unwashed fleece, 19@24c; coarse and unwashed do. 18@22c; medium unwashed do. 25@27c; medium washed do. 35@38c; fine washed do 35@36c; course washed do 30@35c. HOGS—Market strong, active and 5c. higher than yesterday; quality very good; market closed steady, with all sold; common to good mixed packing and shipping, $5 70@6; good to choice packing and shipping, $6.10@6 40; bacon, 15 95@6.05; common to fair light, $5 75@5.90. CATTLE.—Good active demand; fat, 10c. higher than yesterday; exports, $6 20@6 50, fair to good shipping, $5 50@5 90; distillery cattle fairly active and firm at $5 40@5 65; butchers' plenty and slow at $5.25@6; oxen, $4@5; stockers better, with a fair demand; common to fair, $3 50@4 20; good to choice, $4 50@5 20. SHEEP.—Demand brisk; common to medium shorn, $3 75@4.60; good, $5; common to choice wooled, $5@6 25.

To restore nerve and brain waste, nothing equals Hop Bitters. Believe this.—*Adv.*

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 21, 1881.

BEANS AND PEAS.—Medium and marrow beans are steadier with the shaded prices, but the demand for home use is moderate. Exporters have a mewhat enlarged their purchases, taking 1,199 packages for the week, but the demand is not sharp enough to give holders much advantage. White kidneys and pea beans neglected red kidneys very dull. Wisconsin green peas sell in a small way at $1.35 Southern B E meal about used up; last price $3.60 per 2-bush. bag.

Marrow beans, prime, $2.55@2 60; other, $2.35@2.45; medium, prime, $2.50@2.55; other, $2.20@2.45; pea, $2.25@2.50 white kidney, $2.30@2.50, red kidney, $1.40@1 60, black or turtle soup $1.45@1.47.

Receipts of beans for week, 1,961 bush.

BEESWAX.—Market quiet at 23@25c., with small supply. Exports for week, 1,045 lbs.

BUTTER.—With moderate receipts and improvement in quality, many parcels now showing grass, the market has ruled steady during the week and closes with considerable strength. Fine State tubs are selling quite as readily as creamery pails in fact the demand runs mostly for State. There is some call for tinkins at this early date for Southern consumptive use; at the moment they would do as well as tubs. Welsh tubs are scarce and not likely to come forward freely, as cheese-making has become a feature in their district. Only the best established brands of creamery make the extreme rates. Exporters are looking for best stock on late orders from abroad, but the full prices and they want best stock will not offer a margin. Western butter under creamery grade is rather irregular, and a large proportion of it is white, or nearly so and is offered at the cheaper figures. Still the market trade will use it when sweet and sound during the firm condition of State.

Creamery—Western, good to prime, 23@26c.; Penn. 25@26c; State, 23@26c.; fair to good, 21@22c.; sweet cream, 22@24c., State pails and half tubs, choice, 23@24c.; fair to prime, 19@22c.; Welsh tubs, 20@22c.; poor State, 12@18c.; Western imitation creamery, 16@22c.; do. dairy, choice, 18@20c.; other, 16@17c.; factory, best, 20.; other, 16@17c.; old, 9½@10c.

Receipts for week, 26,100 pkgs.; exports, 3 275 do.

CHEESE.—The market has declined fully 2c. during the week and with the break in prices shippers seem more disposed to operate freely. A good deal of stock got into bad repute during the hot spell and the fact has had much effect in forcing down quotations. The demand is only for fine State in a wholesale way and with the improved quality looked for since grass is arrived, the market closes with a feeling of confidence in an outlet, but not for high prices. Skims are decidedly lower and very dull. Flat-shaped cheese quiet.

State factory fine 8¾@9c., fair to prime, 9¼@9¾c; fair to good 8¼@8¾c.; poor to fair 6¼@8¼c.; Ohios fine, 7¾@9¼c.; part skimmed creamery 3½@4½c.; full skims 2@2c.

Receipts for week, 45,250 boxes.
Exports for week, 40,300 boxes.
Liverpool cable, 63s.
Steam to Liverpool, 17s. 6d.@@25s.

COTTON.—The week has been a tame one and there have been no decided changes. Speculators have no pointed inducements for operations, either at home or abroad. Closing prices for contracts:

May, 10.04@10.05c.; June, 10.69@10.70c.; July, 10.74@10 75c.; August, 10.79@10.80c; September, 10.48@10 49c.; October, 10.08@10 10c. November 9 98@10c. December 9,98@10c.; January, 10 08@10.10 February 10 19@10.21.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*N. Orleans and Gulf.*	*Texas.*

STAINED.

Good ordinary	6¾	Low middling	8¼
Strict good ordinary	7¾	Middling	9 13-16

Receipts for the week, 16,876 bales, Exports do. 13,433 do.

DRIED FRUITS.—Evaporated apples now have a better hold on trade, especially for local use, as green lots have become very uncertain in quality. Exporters are taking what good lots they can find at 8@8¼c. Sun-dried are neglected. Peaches are quiet but firm; it is thought that the entire surplus can be used before new are of moment. Small fruits quiet as a rule blackberries lower.

Apples evaporated choice 8¾@9c; fair to prime 7¾@8¾c. North Carolina sliced, common to best 4@5c. Va, do. 4@4¼c; Tenn in bbls. 4¼@4¼c. do in bags 4c; State fine cut 4@4¼c. quarters 4¼@4½c; Western, 4@4¾c, evaporated peaches peeled 27@30c.; unpeeled 13@14c; sun-dried peeled 17@22c; unpeeled 5@6¾c. Plums 12¾c. Blackberries 8@8¾c. Cherries 14@14¾c. Raspberries 23@24c. Whortleberries 11¾c.

Receipts for the week, all kinds, 979 pkgs.
Exports, dried apples, 4,754 pkgs.

EGGS.—Receipts for week, 15,200 bbls.; do. last week 21 413 do. The very low tone of the early part of the market checked supplies, but buyers have resisted any attempt at a strong advance. Quotations will soon be at "loss off" for Western. Southern eggs are nearly all loss and shipments are discouraged.

Near points, 14¾@ 5c.; State and Pa., 14@14¾c.; Western and Canadian, 13¾@14c.; Southern, 12@13c.; duck, 14@15c.; goose 20c.

FLOUR.—Receipts for week, 74,323 bbls; exports, 86 8.2 do. Supplies of high grades are abundant and sales for domestic use have been fairly free. Low grades for export are scarce and very saleable at the close. Rye flour has advanced.

Flour, No. 2 $1.25@3 85; State and Western superfine, $4.25@4.65; city mills extra, $5@6; Spring wheat do. $4.65@5; Spring XX and XXX, $5@6.25; patents, $6.50@8; Ohio round hoop shipping $5@5.40; trade brands, $5.50@6.25; St Louis extra, $5.10@5 50; do. double extra, $5.60@5 90; do. family, $6@6.50; Southern extra shipping, $5 25@5 75; do. XX and fancy, $5.85@6.75. Rye, $5.50@5. Corn-meal, Brandywine, $3.30@3.35; Western, $2.90@3.15.

FRESH FRUITS.—The apple season is about over; a few selected Russets range at $2@3; but there are many rejections closing out at 50c @$1.25. Strawberries are abundant and fine. The rainy week has caused a dull market and the chief trade has been with restaurants. Norfolk is now the principal shipping point but Maryland has begun to pick. Charleston and N C qts 14@18c; Norfolk 14@20c Md. 18@23c. Cranberries nominal, 50@$1 ₱ crate. Hot-house black Hamburg grapes $2 ₱ lb. Peanuts dull and a shade further in buyers' favor: Va. hand-picked 4¾@4¾c; extra prime 4@4¼c; good to prime 3¾@3¾c., shelled 2¾@3c; pecans 7@8c.

GRAIN.—With the bright crop prospects for wheat the market has ruled in buyers favor. The market has opened strong on several days with some advance but the improvement would be lost before the close of 'change. Corn is easy owing to large receipts, but the decline lead to a large business. Oats steady.

Wheat, Spring $1.10@1.21; red Winter No 2 $1.26@1.29½; red Winter $1.24@1.28; white Western and State $1 12@1.25. Corn, Western mixed 54@58c; do. No. 2 56@57½c; do. yellow 57@59c; white Western 58@62c; white Southern new 62@63c, yellow do. 58@60c. Rye $1.10@1.15. Oats, white No. 1 53c; white No. 2 50c.; white No 3 48c; mixed No. 1 45@45½c do. No. 2 45@45½c; do No. 3 44½@44½c.

Receipts for week, wheat, bush., 1 511 100; corn, do. 1.717,200; oats do. 150,600; rye, do 29 700; malt, do. 60,500; barley, do 48 000; rice pkgs. 770

Exports for week, wheat, bush. 620,378; corn, do. 419,224; oats, do. 3,518.

HOPS.—The market is firm with a good brewing demand. Exporters are not active though it is thought that late favorable London advices will stimulate activity.

Choice 20@21@22c good to prime 18@20c; fair to good 15@18c poor to fair 12½@15c. 79's 15@17c; California 19@23c; Bavarians and Bohemian 33@35c.

HAY AND STRAW.—Exports for week 1,400 bales. Choice retailing hay is very scarce; in fact special wants have to be supplied by careful selection. A few car-loads of fancy Jefferson Co. will exceed the extreme.

Prime timothy hay $1.05@1.10 ₱ 100 lbs.; medium 90c.@$1.00 do.; shipping 80@85c. do.; clover mixed 80@85c, do. pure 70@75c.; prairie hay, 65@70c. Long rye straw $1.10@1.15 ₱ 100 lbs.; short do. 70@75c. do.; oat and wheat 45@55c. do.

MAPLE SUGAR.—The remnant is offered at 7@10c. ₱ lb. for sugar; syrup, in cans of 10@12 lbs. 75c@$1 ₱ gal.

MILK.—The weather has been cool and rainy and the market easily overstocked. Prices, however, show a great improvement upon last week, running from $1.50 to $2 50 ₱ can of 40 quarts. New York prices are made up on Tuesday of each week. Total receipts for week, 40,300 cans milk, 350 cans cream.

POULTRY AND GAME.—A few parcels of frozen turkeys remain quoted at 16@20c; fresh killed are poor in quality and slow. Chickens and fowls are quite active. The latter are very firm owing to no reserve of live here.

Turkeys, fresh dressed prime 14@17c; coarse 12@13c; Phila. Spring chicks 50@65c; N. J. 50@60c; Phila. Winter 30@35c, do. Fall 22@25c; do. fowls d. p. 20@21c.; N. J. d.p. 19@20c. scalded 18@19c; State and Western d.p. 18@19c; scalded 18@19c; Ducks 16@23c.; Squabs white, $3@3.50 ₱ doz.; do. dark, $1.50@1.75.

Live fowls have sold very high all the week. When chickens do not exceed two pounds per pair they are hard to sell.

Chickens Spring prime ₱ pair $1.@1.20; poor 40@60c. Fowls, ₱ lb, all 17c; roosters, 10@12c.; turkeys, 14@15c. ducks, per pair, 60c.@$1.12; geese, 75c@$1.75; pigeons, ₱ doz 35@45c.

The offering of game is uninteresting. Wild squab wanted. Snipe must be in perfect condition to make rates.

Wild squab ₱ doz. $2@2,25; Eng. snipe $2@2,25; plover $2; sand snipe 50@60c.

PROVISIONS.—Hog products have had quite a boom this week owing to light stocks and a resumption of the export demand for many items that have been inactive. The stock of lard is unusually light and is under good speculative control.

Pork extra prime $13 50@14; Western mess new $16.75@17; old $15 75@16. Lard—Western steam 11@11¼c; city No 1 hams smoked city 18@11¾c pickled Western 10@10¾c; shoulders smoked city 8¾@8¾c; picked 7¾@7¾c; rib pickled 8¾@9¾c. Bacon long clear Western 8¾c. Beef Western mess $9 50@10. extra mess, $11@11.50; family $12@13 India's $22@24; beef hams $24@23. Tallow, city 6¾@; country 6¾@6¾c. Stearine 13@13¾c.

Receipts for week, beef, bbls. and tcs, 412 pork, bbls. 879; cut-meats, pkgs. 11,050; lard do. 15,012.

Exports for week, beef, bbls. and tcs., 2,150; pork, do. 4,680; cut-meats, lbs. 3,050 150, lard, do. 3,708,750.

SEEDS.—The market is very quiet. Clover ranges 7¾@8¾c.; Timothy $2.30@3.15.

TOBACCO.—There are no new features. A good call exists which steadies prices.

VEGETABLES.—Potatoes are in very full supply for the date and the best are no higher than at our last. Anything under prime is weak.

Bermuda potatoes $7@8 ₱ bbl.; Florida $3@7; Early Rose, Nova Scotia d. h. $2 50. Maine $2.37@2.50; State, $2@2.12 do. bulk, $1.75@2; Prolino d. h. $1.25 Mercer, bulk $2 Jackson do, $2; Burbank, do. $2 12@2 25; do. d.-h., $2@2.37; Chili Red. $2@2.25; Snowflake, bulk, $2@2,37; do. d.-h. $1 87@2.25, peachblow do. $2 25@2 50; Peerless do. $1.75@2; do. bulk, $1.75@2; sweet not wanted; $1@2.

Bermuda steamers are running very full and supplies from the South are enlarging. The weather has been against an active trade and prices have ruled irregular for many sorts of green stuff. Asparagus has been cheap enough for preservers to use it freely, but the market has worked up some in the past day or two.

Cbas. and Sav. string beans $1.50@1.75 ₱ crate; do. cabbages, $2@3 50 ₱ bbl.; Norfolk do. $2@2 25; Fla. do. $2@3.50; do. cucumbers, $2@3.50 ₱ crate; do. wax beans, $1.50@2; do. string beans, flat, $1@1.50. do. do. round, $1 50@2; do. squash, $1; do. beets, $1.25; lettuce, $1.25@2 50 ₱ bbl.; white turnips, $2@2. 5 ₱ 100 bunches; rhubarb, $1.50@1.75 do.; radishes, 50@75c. do.; asparagus, Oyster Bay, $2@2.25 ₱ doz.; other, $1.25@2 Bermuda onions, $1.12@1.50 ₱ crate; do. beets, $1.25. do. tomatoes, 50@60c, ₱ 5-qt. box; Fla. do. $2@4 ₱ crate; old carrots, $1@1.25; hot-house cucumbers $1@1.50 ₱ doz., choice culls, 25@50c.; mushrooms, $1; carrots, $1 ₱ 100 bunches.

WOOL.—The market continues quiet and is likely to be until new wools form a feature. There is no disposition to hold supplies.

Ohio, Penn, and W. Va. XXX and picklock, 43@44c.; X to XX 38@41c.; No. 2 to No. 1, 38@41c. course, 33@36c. combing 39@45.

State and Western X and XX, 36@38c.; No. 2 to No. 1 36@43c.; coarse 30@35c.; combing, 38@44c.; combing unwashed 26@31c.

Va., W. Va. and Md. unwashed medium 26@33c.; Ga. and Lake unwashed medium 26@28c.; coarse 22@24c burry and slightly burry 14@19c; Cal. Spring choice free 25@27c.; fair to good 20@23c., low grade and burry 16@20c. Fall choice 21@23c., low grade and burry 13@18c. Texas choice free 24@26c.; fair to good 20@24c.; low grade and burry 13@18c. Pulled super 38@42c.; extra 35@38c; No. 1, 20@23c; combing 38@43c. lambs 38@42c. Two washed, fair to choice 35@42c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, May 21, 1881.

BEEVES.—Receipts for the week 12,720 head; do. last week. 12,930 do. Prices have continued high and butchers in many instances purchased only for immediate wants. By neglecting one yard for another they have succeeded in getting something off at the close, though perhaps not more than $1 per head compared with Wednesday's market. Coloradas brought 10¾@11¾c. light to prime. Common to fair native steers 10¾@11¾c, to to dress 56@57 lbs.; good to prime, 11¾@12¾c. to dress 57 lbs. Several car-loads distillery-fed bulls 4¾@5¾c. live weight.

COWS AND CALVES.—The market is without quotable change. A fair range for a very light offering is $35@55 per head.

VEAL CALVES.—Live are doing a shade better than they did early in the week. Prime N. J. fed, 6@6¾c.; do. State, 5½@6c.; poor to good yard lots, 4@5¾c; Mt. Hollys, 6@7c.; buttermilk 3½@4c. Up-river dressed, 7¼@9c.

SHEEP AND LAMBS.—Receipts for the week 28,550 head; do. last week, 20,993 do. Free supplies made trade in the main a buyer's market. Owners did not strive to sell out clean at the rates feeling that a small surplus will do better or at least as well. Some very common sold at 4½c; while a number of fine wethers brought 6¼c for general stock, clipped sheep sold at ranges of 5¾@6c. Va. and Ky. lambs sold at 7¾@8¼c; N. J. $6.50@6.50 ₱ head.

SWINE.—Receipts for the week, 25,590 head; do. last week 25,812 do. All sold early to packers and cutters. Nominal price for corn 5¾@6¼c. City dressed State 7¾@8¾c.; do. Western 7¾c.

WANTED.—The date and place of meeting of all Agricultural Fairs and Stock Exhibitions in this country for 1881. Secretaries will confer a favor by forwarding the same to P. O. Box 3318, New York City, at their earliest convenience.

VICTORIES UNEQUALED.

In the only machine that received an award on both Horse-power and Thresher and Cleaner, at the Centennial Exhibition; was awarded the two last Gold Medals given by the New York State Agricultural Society on Horse-powers and Threshers; and is the only Thresher selected from the vast number built in the United States, for illustration and description in "Appleton's Cyclopedia of Applied Mechanics," recently published, thus adopting it as the standard machine of this country. Catalogue sent free. Address

FARMING FOR BOYS AND GIRLS—NO. 23.

HENRY STEWART.

Feeding of Animals.

PLANTS and animals, both, live and grow by feeding. The food provided for them is absorbed, that is, taken in, and made a part of their substance. It is digested and assimilated. Digestion is the process of reducing it to a fit state for assimilation and assimilation is the process of converting it into plant or animal substance. The process of feeding is very much alike in both plants and animals. In both, the food is reduced to a solution and absorbed through the membranes into the circulating fluid, the sap in plants and the blood in animals; and is changed into living substance by deposits in the tissues from these fluids. Indeed so much alike are some of the lower classes of plants and animals that it is only by the different manner of taking their food that we are able to distinguish one from the other.

But there is one grand distinction which seems to mark the difference between a plant and an animal. This is, that a plant absorbs its food through external organs and membranes, while an animal swallows its food and absorbs it through internal organs and membranes. It may be said, then, that an animal has a stomach of some kind or other, however crude and imperfect it may be in some of the lowest species, while a plant has none. Besides, the food of animals is always organized matter; that is matter which has grown and been built up by growth, while that of plants is inorganic, or, at least, the elements of organized substance which have been reduced to their first or inorganic condition. This, however, is one of the interesting facts relating to this subject, but it is not of any practical value, further than that the more we can learn of the true nature and character of out work, the more pleasing and interesting it becomes to us.

The farmer has very much to do with the real knowledge of the feeding and nutrition of animals; because much of his profit is derived from this use of his crops and the more he knows about feeding, the better he can feed and the more profit he can make from his stock.

In the life of every animal there is a continual wear and tear and waste and loss of weight, and it is to restore this loss that food is required. This food must be supplied at short intervals, otherwise the time in which repair is going on would be too short to make up for that longer time in which waste and loss are occurring. A young animal that is growing rapidly requires to be fed several times a day; a young chicken, for instance, needs food every hour in the day, and a young calf every three hours, or the growth is stopped for a part of the time. The food, too, must contain all the elementary parts which make up the animal—flesh, blood, bone, hair, feathers, horn and skin—or the health will suffer. There are fifteen of these elementary substances in the body of an animal, and the animal will not thrive if one of these be lacking. Some of them must be supplied in the daily food and some may be given occasionally, but all must be given in sufficient quantity and at proper times. Thus a farmer should not only know something of the nature of his animals and their needs, but he should know something of the character of the different feeding substances which he grows or which he buys. All this knowledge comprises the science of feeding animals, and it is the most important part of a farmer's knowledge.

An animal takes its food within its body. The food enters the mouth, goes down the gullet, passes into the stomach, thence into the bowels; from the part that is absorbed as nutriment is taken into the veins, or the lacteal vessels, and thence into the blood, which flows to every portion of the body by means of arteries and veins, some of them so small and close together that the point of the the finest needle cannot prick the skin without sounding one or more of them or drawing blood. The fine net work of vessels which connect the arteries and veins serve to distribute from the blood the matter which repairs the waste of the body and builds up and renders the muscles, the fat, the bones and sinews and the skin, with all the membranes and tissues, which, altogether, go to form the whole animal system; and to gather up the worn-out part and return it through the veins to the lungs, the liver, and the kidneys, through which it is passed out of the body as waste, along with that part of the food which is not used in supporting the body. The whole system by which the food is taken into the body and digested, filtered and separated from the waste, and by which the waste is carried off, is called the alimentary canal.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK—We wanted to report to you regarding the seeds you sent us last year, long ago, but we have not been able to do so. Our Surprise Muskmelon and Mignonette did nicely, but the others, although sowed in boxes and placed in papa's propagating bed, failed. Our cotton crop did nicely, and as fast as we picked our own we took it to papa's gin, which he had just built, and had it weighed, just like the big folks. If you will allow us we would like to tell you and the cousins about our chickens being troubled by owls that roost in a big tree. Papa shot one, after which he put a pole in the ground the hight of the tree, a few feet away, and put our trap that we catch gophers with (a common steel rat trap) on top, all ready set, and tied it securely, in which way we caught two, making three in all. I wish you, Uncle Mark, could have seen how pretty "Mr. Owl" appeared, looking down one side and then the other, the next morning, with just his toes holding him, "making him ashamed," our little brother thought. HARLEY AND ELLA MATTHEWS.

Miscellaneous

THE TRUE TEST.

The Merit of Religion, Government, Persons and Things Must Rest upon a Basis of Worth.

Some Truths Illustrating this, and Testimony of Value to All Readers.

(*Christian at Work.*)

The true test of any religion is the effect it produces upon the lives of those who profess it. And, indeed, the test of real merit everywhere must be the power it possesses of accomplishing desirable results. In this age of the world men are not judged by what they claim to be able to do, but by what they can do; not by what they are reputed to be, but by what they are. Here is where the religion of our own country rises superior to the faith of Mohammedan or Hindoo lands; for while there is much hypocrisy in the church, and far too much worldliness, there is yet an absence of those sensual and brutal elements which characterizes the religions of Arabia and the Ganges.

This principle is equally true in all other departments of life. The same rule which applies to persons is equally applicable to things. Unquestioned merit must characterize them all, or they cannot be acceptable, much less popular. The clear and well arranged lecture delivered by Dr. Chas Craig before the Metropolitan Scientific Association appeared in the columns of this paper a short time since. In this lecture so many truths were brought to light bearing directly upon, and affecting the interests of the entire community. These facts, as stated by the doctor in his lecture, have been discussed in the columns of the religious press to a considerable extent in the past, and that, too, by very prominent personages. A few years ago the Rev. J. E. Rankin, D. D., of Washington, who is prominently known among the Congregational denominations of the country, published an article upon the same subject which drew forth most bitter replies from prominent physicians, and in response to these articles Dr. Rankin published long communications in the New York *Independent*, the Boston *Congregationalist* and the Chicago *Advance* reiterating his former statements and strongly emphasizing them. In these articles Dr. Rankin frankly stated he was as strongly convinced of the efficacy of the means used as he was that the Genesee river emptied into Lake Ontario. He further said: "I have known, too, of its use in similar cases by physicians of the highest character and standing, and I want, in the interest of humanity, to recommend Warner's Safe Kidney and Liver Cure."

Now, while very few persons are afflicted as severely as was Dr. Craig, or the cases Dr. Rankin refers to, still it is a lamentable fact that the great majority of people, in all parts of the land, are suffering to a greater or less extent from ill health and that this lack of health arises from either disordered kidneys or liver. Some additional facts, from the highest sources, of special interest upon a subject of such importance to the community, have, therefore, been collected by this paper, and are herewith given:

Rev. D W. Bartine, M. D., D. D., is known in all parts of the land as a prominent and efficient leader of the Methodist denomination. In speaking upon this same subject, as shown in his own experience, he said: "Some few months since I found myself suffering from a kidney difficulty which I knew to be the first stages of Bright's disease. By the use of a reliable test I found that my system was giving off albumen, and in some instances in a coagulated state. I also suffered severely from dropsy, particularly about the ankles, together with slight pains about the kidneys, derangement of digestion and great dryness of the skin. I had at all times much thirst, and of course this was followed by a gradual failing of strength. This was about the state of things when I commenced using the preparation known as Warner's Safe Kidney and Liver Cure. I took about six tablespoonfuls every day for a week, and found all my symptoms decidedly improving. I continued taking the remedy until I entirely recovered."

In a communication made by Rev Dr. C. A. Harvey, the well known financial and educational secretary of Howard University, Washington, D. C., the Doctor said:

"I have for the past few years been acquainted with the remedy known as Warner's Safe Kidney and Liver Cure and with its remarkable curative efficacy in obstinate and so-called incurable cases of Bright's disease which occurred in this city. In some of these cases, which seemed to be in the last stages and had been given up by practitioners of both schools, the speedy cures which were wrought by this remedy seemed to be little less than miraculous. I am convinced that for Bright's disease in all its stages, including those first symptoms of kidney troubles which are so easily overlooked, but are so fraught with danger; no remedy heretofore discovered can be held for one moment in comparison with this, and I hope that Warner's Safe Kidney and Liver Cure may become as widely known as is the existence of the maladies which it will cure."

Rev. A. C. Kendrick, D. D., LL.D., who is Professor of Hebrew and Greek languages in the University of Rochester, N. Y., and who is one of the American revisors of the New Testament, in speaking of the effect which Warner's Safe Kidney and Liver Cure had upon himself, stated most emphatically that he had received marked benefit from it, and he cordially recommended it to the use of others.

Rev. A. Bramley, pastor of the Arsenal street M. E church, Watertown, N. Y., testified in a recent interview that the first few bottles of Warner's Safe Kidney and Liver Cure had entirely removed the distinctive features of a severe kidney difficulty, and that while he had not been able to lie upon his back without great pain for more than five years, he was now not only able to do so, but slept soundly, ate heartily and calls himself a well man.

Rev. A. P Hill, of Shoeheel, N. C., having been troubled with a severe kidney and liver disease for a number of years, said: "I have been praying for relief for four years, and I believe I got it in answer to prayer. May God bless the firm who manufacture Warner's Safe Kidney and Liver Cure. Many of my friends have also used it with marked benefit, and I hope my testimony in its behalf may save the lives and relieve many who are now severely suffering from kidney or liver troubles in some of their many and dangerous forms.

Rev. P. F. Marklee in writing from Montgomery, Ala. said: "I have paid at least one thousand dollars for doctors and medicine and never received any relief until I commenced taking Warner's Safe Kidney and Liver Cure. I am too thankful to express in words the benefit this medicine has done my family and myself. I have been to the hot springs, sulphur springs and several other places noted for the curative properties of the waters, but this great remedy did for me what everything else failed to do—it cured me. I hope the Good Father may crown the efforts of those who are manufacturing it, for the noble work they are doing.

There are no more reliable endorsements be found in this land than those above given and coming from divines of such prominence they prove beyond a doubt the value of the great remedy of which they speak. It should also be remembered that Mr. H. H. Warner, the proprietor and manufacturer of this remedy, was himself cured by its use after having been given up to die by several physicians. So grateful was he for his remarkable cure that he determined the world should know of this remedy, and he therefore began its manufacture. Mr. Warner is also a prominent patron of other public enterprises and the sciences and by endowing the Warner Astronomical Observatory at Rochester, as well as by his many other public benefactions, has become known to, and respected by the whole land. His standing alone is an ample guarantee of the purity and worth of the remedy he makes, but the thousands of testimonials from all parts of America gratefully telling of the relief it has given, prove it beyond a question. As a result it is attracting great and universal attention throughout the entire country. No one fact has been more apparent in the past few years than that kidney and liver troubles are alarmingly increasing. When, therefore, a remedy has been found which not only cures the worst as well as all minor troubles of this nature, but also regulates, controls and keeps in perfect order these most important organs at all times, it is certainly cause for gratitude. This is just what has been done in thousands of cases, in addition to those above mentioned, and it is what will be done in tens of thousands of other cases in the very near future.

SUMMER MUSIC BOOKS!

Take with you to your country or seaside residence a few of our excellent collections of vocal and instrumental music. Send for descriptive catalogues, or choose one of the following:

Gems of Strauss. $2. boards, or $2.50 cloth.

Gems of the Dance. $2. boards, or $2.50 cloth.

These two books include nearly all the best new waltzes, polkas, galops, etc.

Gems of English Song. $2. boards. $2.50 cloth.

Sunshine of Song. $2. boards. $2.50 cloth.

The above have splendid general collections of songs.

Operatic Pearls. $2. boards, $2.50 cloth. This is a standard book, containing the solos of most of the better known operas, and is very convenient to have on hand. But take also a copy of each of our popular bright

New Operas. Elegant editions and marvelous low prices. Billee Taylor (50 cts.); Olivette (50 cts.); The Mascot ($1); Musketeers ($1). The last has had a fine run in London and Paris. Also the more solid recent operas: Mignon ($2); Aida ($2); Carmen ($2); Mefistofele ($2); Fatinitza ($2); and many others.

"Stay-at-home" people will find the above equally valuable and interesting.

Any book mailed, post-free, for retail price.

A CYCLOPÆDIA WAR.

An honored publishing house whose history is reputed to extend back into the last century, and whose wealth has been estimated at $8,000,000, is that of J. B. Lippincott & Co., Philadelphia. The largest and most important publication ever issued by them was in connection with the great publishing house of Chambers, of Edinburgh, Scotland, and London, England, that of Chambers's Encyclopædia, which, many years ago, they published at the (so called) low price of $50, and some years later, as the result of a rupture with the British house in consequence, (it was said) afterwards reduced the price to $40. Now, in the case of the Lippincotts making changes in the American edition contrary to the spirit while still using the name of Chambers, the same Encyclopædia was brought down to the still lower price of $35. Now, in the glorious year 1881, moved, of course, not by the spirit of rivalry, but by the generous and laudable purpose of placing useful knowledge within reach of the people, without regard to the question of profit or of loss to themselves, they are issuing another edition of this same great work, Chambers's Encyclopædia, which is *said to be* revised to *date* (edition of 18 sixty something?), which they are offering at the wonderfully low price of $15 for the work complete, in 10 great octavo volumes. Even at this astounding low price they allow the large discount of 40 per cent. when purchases are made in large quantity. The army of the Literary Revolution always rejoices at the multiplication of good books at low prices, and the AMERICAN BOOK EXCHANGE is delighted with the opportunity of uniting with the great publishing house of Lippincott in furthering the sale of this work; and to demonstrate the earnestness of their good-will they propose, so long as the Lippincotts choose to continue the manufacture at this nominal price, to furnish the public with the Lippincott edition at the low price of $9.50 per set, (the 50 cents for cost of handling,) delivered in New York city, or sent by express or freight to any part of the United States or Canada. Considering the munificent liberality of the Lippincotts' terms, it has seemed a great pity that their modesty should prevent them from advertising more widely, and we therefore supplement their generosity by scattering this advertisement broadcast for them at our expense.

The Literary Revolution

Has not the honor of a century's history, and its present cash capital is only about $175,000. It was started only so long ago as September, 1875, with $70 cash and a few old books, and two years thereafter had reached the dignity of a garret in an Ann Street junk shop, its "army" consisting of one man and a small boy and from the character of the place, *cimex lectularii*, (b-d b-gs) being far more numerous than customers for books. But by January, 1879, the Revolution had accumulated sufficient strength to print one small volume, which was increased to a product in 1880 of *over one million volumes*. Its business offices and retail store now occupy entire a magnificent six-story building on Broadway, and its factories several other buildings elsewhere in the city, and it gives employment to about 600 hands. One item of its present large list of standard publications is an edition of Chambers's Encyclopædia, in 15 handy, beautiful cloth-bound volumes, which it is selling at the low price of $6 per set, (lately reduced from $7.50). This edition is a verbatim reprint of the London edition of 1880 (instead of that of 18-sixty something, as in the case of the Lippincotts, with the alteration of a few census figures). Chambers's Encyclopædia, however, is a foreign work, and it could scarcely be expected that such a work, edited and published for a foreign market, would give as much prominence to American topics as American readers might desire. To supply these and other deficiencies, we are now issuing under the Title of the "Library of Universal Knowledge," a new edition in fifteen large octavo volumes, large type, in which a large force of American editors and writers have added about 1,500 pages, thus thoroughly Americanizing the work, and making it nearly 40 per cent. larger than the original Chambers's, 10 per cent. larger than Appleton's, and 20 per cent. larger than Johnson's Cyclopædias. Of this edition, ten volumes are now ready for delivery, Volume XI. will be ready May 20, and the remaining volumes at intervals of a few days thereafter. Price per volume in cloth, $1; in half Russia, gilt top, $1.50.

$6.00.

Universal Knowledge

Triumphant

"First come, first served," is an old motto which we have supplemented by "Lowest prices to earliest purchasers," and accordingly, on this edition, we are *for a few days* offering *the ten volumes now published at the net price of* $8.75. This price will very shortly be increased.

Of course the 15,000 topics and 3,000 pages of new matter added to this edition are not to be found either in the Lippincott edition, nor in our own $6 edition. Both of them, however, are excellent works, remarkably cheap, and serve a good purpose for those who cannot afford the new and enlarged edition. Specimen pages, showing type, and giving full particulars, will be sent free on request. Throughout the United States and Canada are prepared to either abundantly supply or liberally slander our publications. We give liberal terms to clubs where no book-seller acts as agent. Descriptive catalogue and illustrated pamphlet describing book-making and type-setting by steam, will be sent free on request.

It is with pleasure that I offer the most perfect musical combination and wonderful instrument ever made.

THE "BEETHOVEN" NEW STYLE No. 9,000

which is destined to be the most **popular Organ** the world has ever seen. My success in the past having been so unprecedented, I feel warranted in doing better than ever for my customers, hence this unparalleled offer. I have now the

LARGEST FACTORY IN THE WORLD

that ships its products direct to the purchaser, avoiding extortionate profits, middlemen and agents, manufacturing my own Organs in **my own factory**, and being sure of selling thousands of this charming style every month. I offer this Organ, combining a **grander variety** of stop work, **greater power**, more musical effects, and the most elegant exterior, including a first-class stool, book and music, boxed and delivered on board the cars here, for only

$60.00

YOU CAN TEST IT IN YOUR OWN HOME, FREE OF EXPENSE, FOR ONE MONTH.

It contains 27 Stops, 5 Octaves, 10 full sets of Golden Tongue Reeds, as follows:

Manual Sub-Bass,..16 feet tone,	Saxaphone,.. 8 feet tone,
Diapason,..... 8 feet tone,	Voix Celeste, 8 feet tone,
Dulciana,..... 8 feet tone,	Viola Dolce, 4 feet tone,
Cello,..... 8 feet tone,	Violina,..... 4 feet tone,
French Horn..... 8 feet tone,	Piccolo..... 4 feet tone,

also, Coupler Harmonique, Harp Æoline, Grand Expressione Vox Humana, Vox Jubilante and other grand accessory effects as below.

SPECIFICATION OF STOP WORK, 27 IN ALL.

1—Cello.
2—Melodia.
3—Clarabella.
4—Manual Sub-Base.
5—Bourdon.

28. Beatty's New Patent Adjustable Stop Action. In this action is reached the highest state of perfection attainable. The case of the Beethoven Organ is a design of **rare beauty**, and is simply unrivaled at the price offered. Beautiful Lamp Stands suitable for a lamp at night or **vase of flowers** by day. It is of **solid walnut** with extra large fancy top decorated with original designs in fret work. Receptacle for music, book rack, music holder of chaste design, carved handles for moving paneled sliding fall with lock; the whole being decorated with **Arabesque Designs in Gold.**

The above beautiful Organ was never equaled in the history of the organ trade for Excellence in every feature. Order direct from this advertisement, as I positively will not deviate from price, **$60.** Cash Orders take preference on order book.

COME TO WASHINGTON, NEW JERSEY, AND SELECT AN ORGAN IN PERSON. YOU ARE CORDIALLY WELCOME.

You will be afforded an opportunity to inspect everything and satisfy yourself in every particular. **Beware!**—I unhesitatingly advise those who are about to order from other parties, not to do it. Order only the latest and best of all Organs. If you have already ordered, countermand your order, it may not be too late yet. An Organ lasts a lifetime, get only the latest style and best music combined. **Remit by Post Office Money Order, Express Prepaid, Bank Draft or Register Letter. Money refunded and freight charges paid if all is not as represented. It is a well-known fact that I am the man** that had the nerve to reduce the price of Pianos and Organs, in the face of untold abuse from the monopolist. The public should remember this and patronize the original *not* the *imitator*. REMEMBER any offer made (by imitators) no matter how low. I can beat it. *WEIGH THESE WORDS CAREFULLY.*—I dare not ship you a poor instrument as it is not possible for me to know who will test it. Agents invariably conceal defects and claim advantages for Organs they sell. My instruments must be good enough to silence maligners and defamers. They invariably prove satisfactory. Thousands are now in use. **IT IS A FACT** that my business has increased to such proportions that even now with a factory having **ONE AND A HALF ACRES OF SPACE** within the walls of building, filled with skilled artisans and best machinery **is the reason I can offer this Organ so low.** I am now enlarging my factory **TO OVER DOUBLE ITS PRESENT SIZE.** I should be glad to have you come here and visit my establishment.

RECIPE for oilymargarine:—Peanut lard, oleo, oils, alum, acids and dirty workmen. Mix.—Port Jervis Gazette.

A GOOD NATURED traveler fell asleep in a train and was carried beyond his destination. "Pretty good joke, isn't it?" said a fellow passenger. "Yes," said the g.-n. t., "but a little too far-fetched."

THE train had just rolled into the station, and little Charlie stood listening a moment to the sound of the escaping steam. Then, turning to his father, he said, "Pa, the engine's all out of breath, ain't it?"

"MOTHER, what is an angel?" "An angel? Well, an angel is a being that flies." "But, mother, why does papa always call my governess an angel?" "Well," exclaimed the mother, after a moment's pause, "she is going to fly, immediately."

A Standard Article Everywhere.

It is a long way from the Atlantic to the Pacific and from Maine to the Gulf of Mexico, but in all the vast area lying within those boundaries there is not a city, a town, village, settlement or camp where Hostetter's Stomach Bitters is not well known and in great demand. It is the great household medicine of the American people, and is taken everywhere as a safeguard against epidemics and endemics as a remedy for dyspepsia, biliousness and irregularities of the bowels, as a cure for chills and fever and rheumatic ailments, as a sedative in nervous cases, as a wholesome exhilarant in hypochondria, and as a general invigorant and restorative. To the weak and drooping it imparts strength and vitality, bracing the relaxed nerves and rousing all the latent energies of the system. For years it has been the standard tonic and corrective of the western world.

The Swine-Herd.

OUR ANIMAL PORTRAITS.

The Essex Boar, Black Duke.

To the Eastern Farmer who is also a fruit grower, the question of what hog to keep is an important one. He has two objects in view in keeping pigs;—one to have them help eat the prematurely fallen and wormy fruit, and the other to make the largest amount of the most desirable meat, for the food consumed. While some may desire a hog "as long as a rail" for the sake of getting plenty of side pork and bacon, it must be remembered that all that class of hogs are thick-hided and voracious eaters, and soon eat themselves up. Moreover, one can hardly feed them so much that they will not squeal for more, and of all musicians the most discordant is a squealing hog. For all purposes in the East, no pig so fully "fills the bill," as the Essex. He is always quiet and peaceable, always in good condition; his meat is fine-grained, and a very large proportion is ham and shoulder, the highest-priced and most desirable meats, and when slaughtered very little is wasted, and where it is best known the meat commands the highest price.

An excellent specimen of the Essex breed is shown by Fig. 277. This is the boar, Black Duke, 1067, the property of Mr. J. S. Woodward, of Lockport, N. Y. He was farrowed October 15th, 1879; sire, Duke of Richmond, 21; he by Imported Negro; dam Sister Sally, by Imported Raven; grandam, Lucy Long, by Stockwell; great-grandam Hester, by Black Prince; great-great-grandam, Imported Queen May.

It will be seen he has some fine blood in him and he is worthy of his ancestry. He is remarkably fine-limbed, thin-skinned and short-nosed, with small, fine ears. In reality he is in every way better than he is here shown, owing to the unfavorable position in which he was taken. He gets remarkably fine stock, and took first premium at the New York State Fair at Albany.

Apiarian.

A FEW WARNINGS TO BEGINNERS IN BEE CULTURE.

Bee culture, to be successful, requires brains, study, work and perseverance. The regretted Samuel Wagner, originator of the American Bee Journal, has defined these requisites in a few words: "To know what to do, and to do it in time."

Within ten years very many enthusiasts have engaged in bee-culture with the vision of sudden and untold riches to be reaped without work; and have bought the hives and implements necessary for large apiaries. But in nearly every instance, their bright anticipations have ended in disappointment, if not in disaster; for an inexperienced person who has suddenly become the owner of a large apiary is overwhelmed by a work with which he is not familiar, and which ought to be done well and at the right time. He thus makes blunder on blunder, and the final result is loss instead of profit. My advice to beginners is, therefore, to begin slowly; to buy one or two colonies of Italian bees only, in movable frame hives of the Quinby or Langstroth pattern; then to buy a few books on bee culture and study in the books and in the apiary. All the outlay ought not to exceed $50, including the cost of the books, of two or three empty hives of the same pattern, and of a few other implements, such as a good veil, a smoker, etc. Then, after a season in the study of the pursuit, if the work has proved pleasant, the number of colonies may be increased, little by little. If, on the contrary, the pursuit seems distasteful, the loss will be small and the riddance easy. Everybody is not fit to become a successful bee keeper. The business requires a tendency to observation, that only some persons possess.

There is also another danger against which a beginner ought to be warned. It is the persuasion that bee-keeping is a very profitable business. No doubt there is money to be made in bee culture; but for a few who have succeeded, hundreds have abandoned the pursuit, or have relegated it to the second place, conducting it with some other business. I know some, among these last ones, who have become very good bee-keepers, and who increase largely their income with the profits derived from their apiaries. To sum up, I advise those who desire to try their hand at bee-culture, to begin slowly; to continue their regular business, if they have one; and to make of bee-keeping a pastime before investing largely in bee-hives. There is something very fascinating in the reports of large yields of honey and enormous profits therefrom, but only those who have had long experience in bee-keeping, need look for such grand results.

Field Crops.

ONION GROWING IN VERMONT.

T. H HOSKINS, M. D.

Wherever the professional knowledge of farmers advances beyond the hay, oats and potatoes period—the elementary stage, so to speak—the first sign is shown in the courage to attempt a garden. The garden vegetables most desired in a farmer's family are beets, cabbages and onions. Beets almost anybody can grow as soon as he has learned to thin properly, and keep out the weeds. Cabbages are work for a higher class in the graded school of horticulture. Thanks to the greater skill and honesty of seedsmen, the worst of all the old obstacles, "they won't head," is not now often met with, except by those who still buy their garden seeds out of the peddle-boxes annually left in the grocery stores. Good cabbage seed is sold by all responsible seedsmen, and with Wakefield, Winningstadt, Fottler or Stone-mason, the non-heading trouble is eliminated. But cabbages suffer from the cut-worm, the cabbage-worm and lice. Club-root is not often seen in farm gardens, where only a family supply is grown. Soon the gardener learns that a turn of stiff paper around the stem of the young plant excludes the cut-worm, and that a few judicious dashes of scalding water slay the cabbage worms and the aphides. Then cabbages are plentiful on the farmers' tables. The full course in farm gardening is made when success with the onion is attained. This is reached in Vermont by not more than one in a hundred. The three or four farmers in a town, who can succeed, have then in their hands a most profitable crop. Onions are almost a legal tender in most towns in Northern Vermont at a dollar a bushel. This is about as low as they can be brought here by our merchants, and well-ripened home-grown bulbs are preferred. The growers wagon them about and soon dispose of 300 to 1,000 bushels in every township.

Where the season is long enough and the soil most favorable, the Yellow Danvers Onion is preferred as a market crop by most of our growers. Some of the towns are quite onion towns, often shipping large quantities to the Boston market. This is notably the case with Cornwall, in Addison County, where excellent schools and a free library have developed the intelligence of the people far beyond the average. The Red Wethersfield, however, is still preferred by many who grow for their own use. The old large variety of this onion is rather later than the Danvers, but, when well ripened, red onions are better keepers than the yellow kinds. The Early Red Globe and Early Flat Red are beginning to be tried with satisfaction where the seasons are rather short, or the soil not quite warm enough for the Large Red or the Danvers. But for market, only the Danvers is planted. If the land is well prepared and manured in the Fall and the seed put in as early as possible, the crop of the latter usually ripens well. But there is very little margin in the season, and the loss of a week in planting is often the loss of half the crop.

After the right preparation of the soil is mastered, a knowledge (very important) of the best strains of seed secured, and skill in culture and handling attained, the onion worm still remains a standing menace against the unskillful or the dilatory. Usually a small bed of black-seed onions will be destroyed by them, or nearly so, in spite of every care, especially in the years when they appear in unusual abundance. Some rely upon salt and some upon hot water for protection, but usually a farm garden is not looked after close enough to stop their ravages before it is too late. The onion worm is decidedly the greatest of all obstacles to amateur onion growing, and from that point of view the greatest of all benefits to those who make a business of onion raising. The latter rely only upon digging up promptly with a trowel (taking dirt and all) every plant that by wilting shows the presence of the worm. A two weeks' campaign, vigorously pushed, wins the victory. The fire or a deep-dug grave is the only safe depository for the captured worms.

Those who object to this work and yet will have onions, usually plant the Potato Onion or top varieties, which start large and strong, and do not readily succumb to the attack of the worm. Both of these kinds are unprofitable for market on account of poor yield, though they are often grown for an early supply, as well as for home use. I know of but one variety of the top onion, and that is both a poor keeper and a poor yielder. But there are several strains of the Potato Onion or "multiplier," which vary greatly in their characteristics. Some are of even less value than the top onion as a commercial crop. Seven or eight years ago I found, growing in

a friend's garden, a "multiplier" of remarkable vigor and productiveness, the seed of which he said had been sent to him from California by his son, who obtained them from a Chinese gardener. I purchased a peck of these onions and have grown them more and more largely, latterly to the gradual exclusion of black-seed varieties, the "multipliers" now forming two-thirds of my crop. This onion is so vigorous as often to produce bulbs of over a pound in weight from the smallest sets. Larger sets produce circles of bulbs from the size of a breakfast plate to the size of a dinner plate, containing sometimes as many as 40 onions. The outer ring of these clustered bulbs are of good merchantable size and symmetrical form, resembling the Danvers, though not so globular as the best strains of that variety.

Within this outer circle the bulbs are smaller, a central bunch of from six to a dozen being pushed up by the growth of the outer circles and forming a cluster of small sets like a bunch of top onions. The yield, under proper cultivation, is from 10 to 14-fold. The crop here (45° north latitude) is usually got into the ground at the last of April and harvested by the middle of July, being followed by late cabbage, set between the rows at the last of June. It is usually said that "multipliers" do not keep well, but mine are the best keepers of any sort I have ever grown. Yet to keep well they must be carefully handled. A bruised one always rots. After drying a couple of weeks in an airy loft, I bunch them upon straw, about a peck in a bunch, and hang them up in the cellar. For several years I have wintered 100 bushels in this way with almost no loss. Left hanging in the Spring, they will keep the Summer through, with no disposition to sprout. In quality they are everything that could be asked for. I believe that these "multipliers" planted in Carolina would be ready to market as early as the Bermuda crop, and would out-sell them.

TOBACCO CULTURE.—NO. 11.

Profits.

THE acreage devoted to the growing of tobacco in the Chemung Valley, is constantly increasing. It has been increasing slowly but steadily for 20 years, and if our farmers continue to receive remunerative prices for their crops, undoubtedly it will continue to increase as long as good soil is available. From this constant increase of the business it is quite evident that the growing of tobacco here pays. While this is undoubtedly true in most instances, it is necessary, in order to draw correct conclusions, to study into the matter and take into consideration the varied changes in the soil due to long-continued cropping, the outlay necessary to commence the business, the immense cost of growing a good crop, and the risks of failure, which no foresight or care can remove.

It is a well established fact that tobacco is a heavy feeder and draws heavily from the fertility of the soil. Land devoted to this crop must receive annual applications of manure, or both the crop and the soil will suffer. In the light of these facts it is not surprising that some of our farms are already deteriorating in fertility and depreciating in value. Farmers who have found little profit in ordinary farm crops have rushed into tobacco growing, almost heedlessly planting a large part of the best portion of their farms to tobacco, hoping thereby to obtain large profits. In some cases profit has thus been realized and farmers have thus placed themselves out of debt; but if the business is continued it must end with positive loss, for it is only on an exceptionally rich farm that a large percentage of the area can be planted year after year to so exhaustive a crop without causing permanent injury to the land, unless great care is taken to keep up the fertility of the soil.

The immense amount of labor necessary to produce a good yield of tobacco must not be overlooked in judging of the profits of the crop. From the day the seed is sown in the plant bed until the last case has been delivered at the depot whence it is shipped to the buyer, tobacco requires attention. The labor necessary in the various processes of growing and handling the crop, is so great that other portions of the farm frequently suffer neglect. Hence it is that we find on some farms where tobacco growing is made a specialty, dilapidated buildings and fences, neglected crops and a general state of untidiness. In such cases there is less profit from tobacco growing than is usually supposed. Tobacco is a money crop; of this there can be no denial, but because it yields to the grower more ready cash per acre than most crops, it does not follow that it is always highly profitable. The greatest hindrance to making tobacco culture profitable is lack of manure. If our growers had good stable manure in unlimited quantities, they might mine money from their tobacco fields. But this is not the case, and it can only be had in limited supply. What is made in the city, which is little in comparison with the demand for it, is eagerly sought after by market gardeners and near-by tobacco growers, and bought as rapidly as it is made. Commercial fertilizers have not proved a substitute for stable manure, and green manures are not suited to the wants of the plant.

Our farmers must pay more attention to the careful handling of their tobacco crops. Less quantity and better quality will in most cases, produce more real profit to the grower. Much attention should be paid to making and saving manure, and clover should be freely used to maintain the fertility of the soil. With proper care on these points, tobacco does not "run down land," as is frequently stated; but, on the contrary, the judicious rotation of crops, the abundant fertilization and the thorough cultivation of the land necessary for good management in tobacco culture, bring the soil into the best possible condition for growing general farm crops; and hence tobacco culture improves rather than injures the farm.

ORIGIN OF BLOUNT'S WHITE PROLIFIC CORN.

PROFESSOR A. E. BLOUNT.

IN a late issue of the RURAL I am asked whether my White Prolific was not originally the Peabody Branching Corn. The two are about as nearly related as the Berkshire hog is to the Chester White. A short history of the White Prolific may show its origin and genuineness.

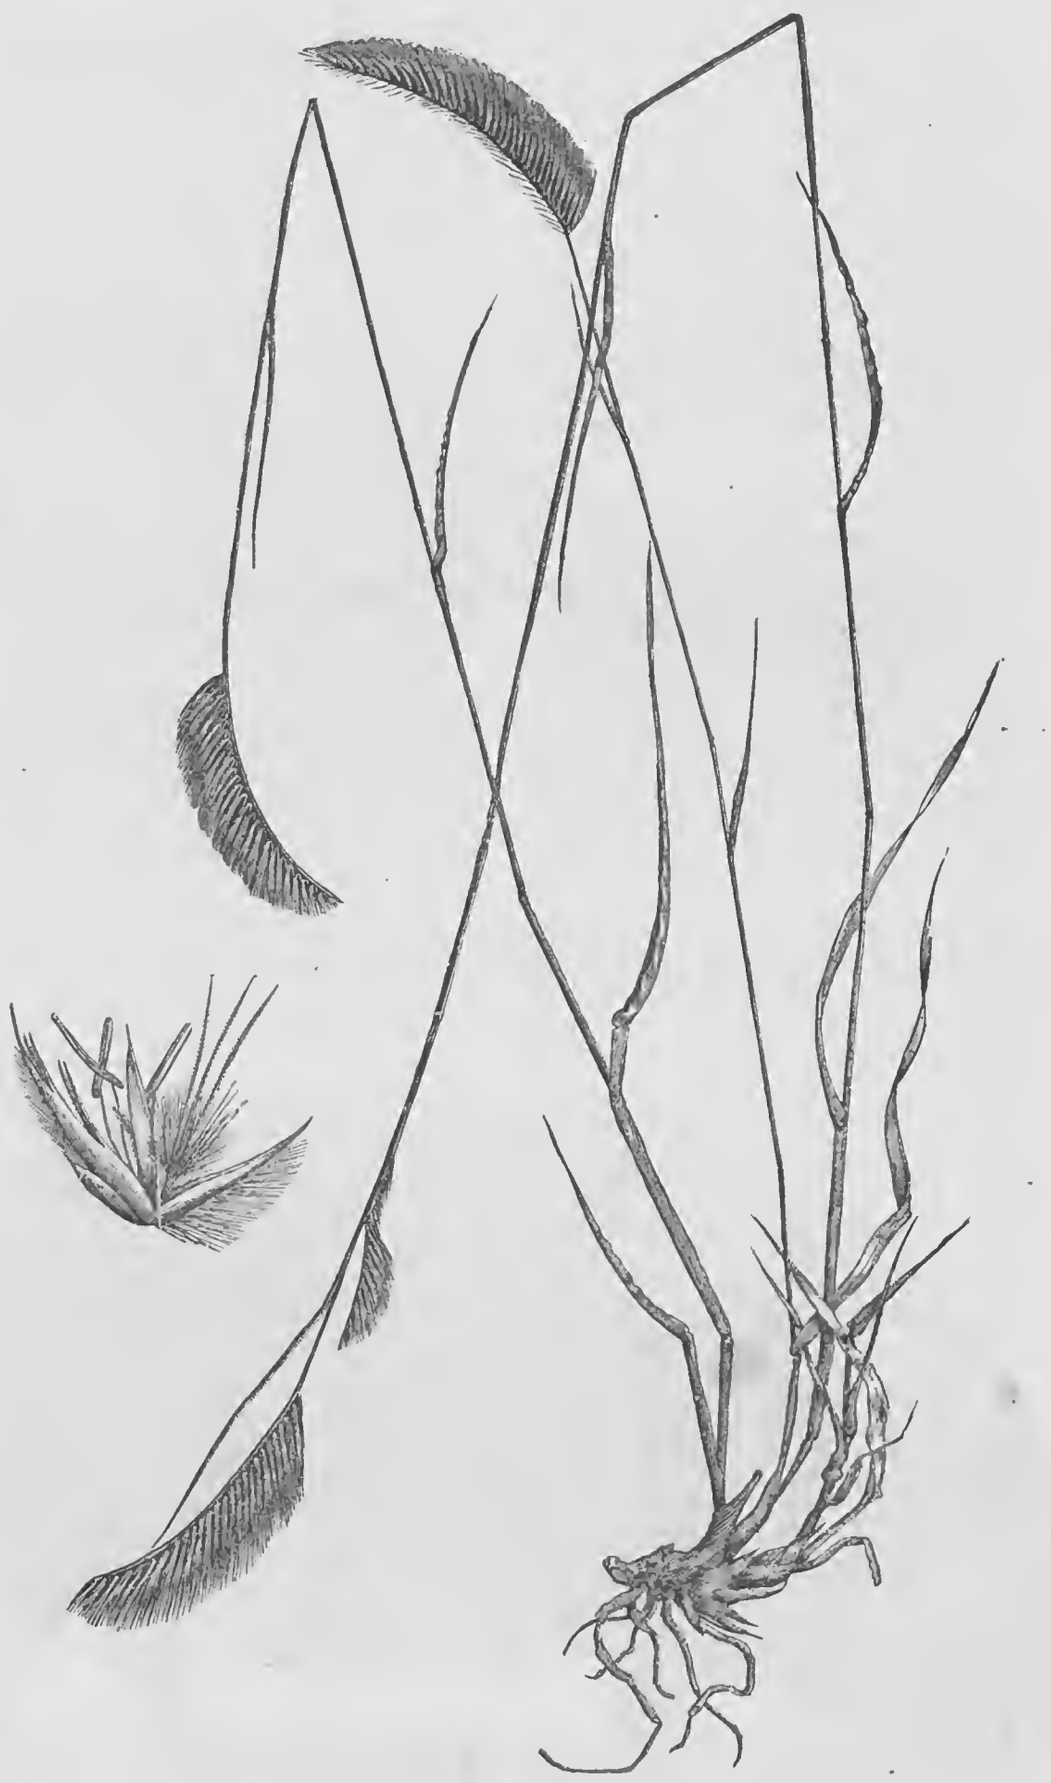
In 1871 I raised my second crop of corn—10 acres—the seed of which I obtained of a very nice and particular farmer on the Tennessee River. It was a soft white dent and of long life, taking 175 days to ripen. While this crop was tasseling I found several stalks ripe enough to cut up. Acting on the idea that an earlier corn was desirable, I saved from these a few ears and planted the grain alone the next season. This ripened in just 150 days. I watched and studied its habits, cultivated and trained it according to theories of my own, some of which I will enumerate. Just before silking I covered about 100 ears with thin muslin to keep all foreign varieties from mixing with them. When in full tassel and full silk, I pollenated every ear with tassel of another stalk of the same kind. When these ears ripened I saved the earliest ripe, best shaped ears with the smallest cobs, straightest rows, hardest and best formed grains. I saved those that grew on the best proportioned stalks, that bore the finest fodder, and last, but by no means the least important, I selected the top ear on those stalks that had two or more of good size.

In 1873 the result of my labor was so satisfactory that I gave my corn the name it now bears. All my theories were soon confirmed by actual facts. I found improvement in every direction.

My corn ripened earlier by 10 to 15 days the third year; the ears were larger, the cob smaller, the grain finer and harder, the stalks finer and more perfect in every way. In 1879 I sent over 50 bushels to the RURAL, with what results the world on this side of the Atlantic well knows.

I am aware that several attempts have been made to missell my Prolific by the name of Mammoth and of some other varieties. If not too far deteriorated, I am pretty sure the stamp of my improvements is still on the ear, as was clearly shown in the ear I received from the RURAL office two weeks since. For the benefit of Waldo Brown and others who think they have discovered a great secret, you may answer, if you think it necessary, by a short extract or two from this letter, which I am by no means writing for publication.

[We cannot improve upon the letter.—EDS.]



GRAMA OR MUSKIT GRASS.—FIG. 278.

Grama Grass, Muskit Grass.—Bouteloua Oligostachya.

This is a rather small, slender grass of peculiar appearance owing to the comb-like, one-sided spikes, and when in flower the anthers are orange-colored or red. It might be called an ornamental grass, but this is also true of most other grasses. It grows from Northwestern Wisconsin westward and southward and is of considerable importance as a pasture grass, though rather short and thin for mowing. It seems well adapted to dry land, and does not seem to improve with much moisture.

Mich. Agr. Coll. PROFESSOR W. J. BEAL.

Farm Topics.

NOTES FROM THE RURAL GROUNDS.

OF all Mr. Ricketts's seedling grapes, perhaps Lady Washington up to the present time has excited the most widespread interest. Wherever exhibited its semi-transpareney, rose-colored bloom, and large, showy bunches have been admired by all. The vine, besides, wherever tried has made a strong growth; the leaves are large and we have not hitherto seen a doubt expressed as to its hardiness. Our own specimen fruited last year, and two canes made a growth, each, of about 12 feet. We were surprised therefore, and make the statement with regret, that last year's growth has been killed by the past Winter and the new shoots appear only from the old wood near the ground. We have also two vines each of Highland, Newburgh and Eldorado, and one of Ricketts's No. 1, which have been injured in the same manner.

Our readers should not accept this report as proof that the above varieties of grapes are not "hardy." It proves that they can not stand the rigors of an exceptionally severe Winter in a situation which itself is exceptionally trying to the grape. Let us hope that elsewhere they have passed the Winter without harm. All of our small fruits have been treated peculiarly the past Winter. Cuthbert Raspberries in a new plantation are in full leaf to the very tips; while one in an old patch is killed to the ground. Of two Philadelphias four feet apart, one is killed to the ground and the other scarcely hurt. Caroline is looking fine, while Turner is badly injured. "Henrietta" and Belle De Fontenay are not harmed. We preserve the different names the same as if there were still doubt as to their being the same.

Our blackberries are all more or less seriously injured, except Snyder which is not harmed in the least. Among our trial plots of strawberries (about 75 different kinds) Duchess is the first, America the second, and Miller's No. 5. the third to set fruit.

Hall's Apple (Malus Halleana) is now in bloom, and a beautiful object it is, with its large, white blossoms and pear-shaped, glossy leaves.

We planted a number of the new and much-talked-of potatoes in trial plots side by side, weighing the pieces planted and being in every way careful that each receives the same treatment, as nearly as may be. They are all above ground. Potato beetles were never before so abundant. As Paris-green or London-purple cannot well be applied to the young shoots we are obliged to pick them off twice each day.

IMPROVING PERMANENT MEADOWS.

THERE are some sections of the country where, owing to their general character, it is undesirable that meadows should be brought under the plow. This is particularly true of considerable portions of New England; and this is the reason why certain parts cannot be brought under such a system of rotation as prevails, for instance, to a considerable extent, in portions of New York State. With a soil naturally rugged for cultivation, owing to the presence of numerous rocks and boulders beneath the surface, when once turned from the plow to meadow, with a laborious task of picking up and removing the stones, the farmer naturally feels a strong disinclination to repeat the operation any oftener than is absolutely necessary. But it is a law of vegetable economy that no field that is continually cropped can maintain a continued state of suitable fertility, and so, this being the case, some provision must be made for the restoration of such elements as are withdrawn from the soil by a hay crop; and, if plowing and the usual modes of application of fertilizers are to be abandoned, some other course must be pursued. With a great many, and especially upon some soils, it is believed that a surface application of manures is the most desirable; here, then, is a solution of the question regarding permanent meadows. Under ordinary circumstances any of the chemical fertilizers that are of value to the farmer can be spread upon the surface, and by means of the falling dews and rains these are carried to the roots of the grass—the very point where fertility is useful. Such fertilizers being largely soluble their effects are active but not permanent. For permanence there is nothing better than ordinary farm manure applied as a top-dressing. But in order that it may be no obstruction to the use of the mower or rake, it should be thoroughly decomposed by means of composting or else by being worked over sufficiently to induce such fermentation as is necessary to break it down and make it fine so as to spread more evenly. Farmers who have not tried this mode of maintaining meadows will be surprised at the result. Fields in which the crop of grass is light, by a small annual top-dressing of well pulverized manure will produce a great increase from year to

year. It is a question if this is not the best mode of enrichment the farmer can employ in case of such fields as have been described.

Tolland Co., Conn. WM. H. YEOMANS.

A Three-Horse Evener.

Having seen several engravings of three-horse eveners lately in the RURAL, I send a sketch of one in common use in this section. While using it one horse walks in the furrow and the other two on the land. It is very convenient, and has the added advantage of being easily and quickly put together. To make it, all that is needed is a pair of common doubletrees, one singletree and a piece of timber long enough to reach from the center of the former to that of the latter. In this bore holes near each end, through which to fasten the double and singletrees. Then, having measured the distance between these holes, bore another one-third of the length from the end with which the doubletree is to be connected; thus the single horse will have twice as much leverage as the team, and will therefore be able to pull evenly with them. A, singletree; B, doubletree; C, connecting piece of timber; D, connection with plow. N. J. SHEPHERD.

Miller Co., Mo.

[REMARK.—The principle of construction of the above, it will be seen, is the same as in the three-horse eveners previously illustrated in the RURAL. The long evener in this case takes a horizontal position with reference to the furrow, while in the former illustrations it was perpendicular to the furrow line.—EDS.]

Dairy Husbandry.

THE DAIRY COW. NO. 33.

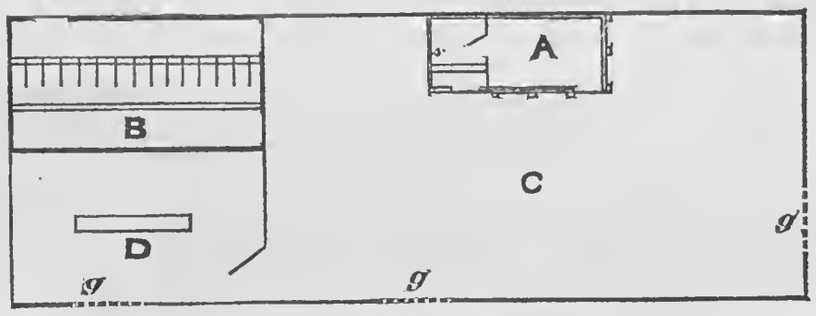
HENRY STEWART.

Selection and Care of a Bull.

THE dairyman may make it a part of his business creed to believe that dairy cows must be bred and reared especially for the dairy. He cannot afford to pay a breeder to do this work for him. The mere milk-producer may do passably well by buying cows in the market and using them as long as they are milking freely, and then fatting them and disposing of them to the butcher and replacing them with fresh cows. To do this with profit, however, requires a concurrence of favorable circumstances, good judgment in buying and selling, and a market for the fat cows in which they can be disposed of without loss. It is even a question for the milk dairyman to consider if the expense of feeding a good cow during the period when she is falling off in her milk and approaching parturition again, may not really be less than the inevitable losses arising from the frequent sales of dry cows and the enforced purchase of fresh ones. In general, and without exceptional facilities, with the advantage of considerable capital, and sometimes the profit to be derived from supplying neighboring dairymen with cows purchased and brought in with his own, the dairyman will find that he can breed and raise his own cows and keep them over their dry period at far less cost than he can buy fresh cows and sell the dry ones. And this will be found true even without taking into account the important advantage accruing from the possession of a herd of extra-good cows, which milk well in their flush and continue without unnecessary failure in quantity for a long period. With the butter-maker no question of this sort arises. *He must breed and rear his cows*, for they are not to be purchased at such a price as he can afford to pay, and it is a palpable fact that *it costs no more to rear a good cow than a poor one.*

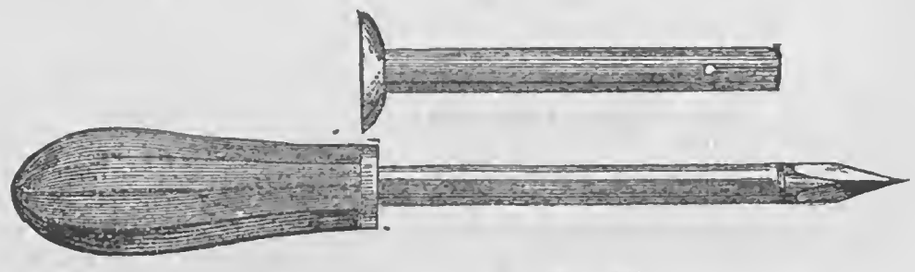
This being the case, the selection and care of a bull for dairy purposes becomes an important part of the dairyman's business. This influences the character of the progeny, and, to some extent, the sex of it; and it goes without saying that it is to the dairyman's interest to have as many heifer calves as possible. To secure the first effect, the bull should be taken from a herd of known good character, consideration being given not so much to the fact that the bull's dam was a good milker, or a large producer of butter, as to the certainty that the line from which the bull came was good. A phenomenon in the dairy is apt to disappoint expectations. The descendants of some of the most noted cows have been very ordinary animals, and some have been very poor ones; but if the habits of the family, dam and grandam, sisters, nieces and aunts, has been good, without any one possessing extraordinary capability, the result will be more satisfactory. From what has been said previously on this point, the writer's views have been sufficiently explained, and need no repetition here.

To secure a preponderance of heifer calves it is advisable to use a young bull—one not older than five years. For a small herd an animal 18 months old may be used to begin with, and if he is kept until he is five years old he may make two crosses on his own heifers, and be the sire of his own granddaughters, which will be far enough to go in line breeding even with the most satisfactory materials. The effect of using a young bull upon aged females has been conspicuously noted in sheep breeding. An instance out of many may be given as follows:—A flock of ewes, served by rams under 18 months old, produced from two-year-old ewes 14 male and 26 female lambs; from three-year-olds, 16 males and 29 females; from four-year-olds, 5 males and 21 females. There were several twin births. Another flock, served by rams over four years old, produced from two-year-old ewes 7 males and 3 females; from three-year-olds, 15 males and 14 females, and from four-year-olds, 32 males and 14 females. There were no twin births in this flock. In the former flock there were in all 35 male and 76 female lambs, and in the latter 55 males and three females. This remarkable result has been verified by other instances, and although it may not serve as a basis for a special rule, yet it points very strongly towards the existence of a physiological law of which we have evidence in the highest race of animals, as well as among the lower ones.

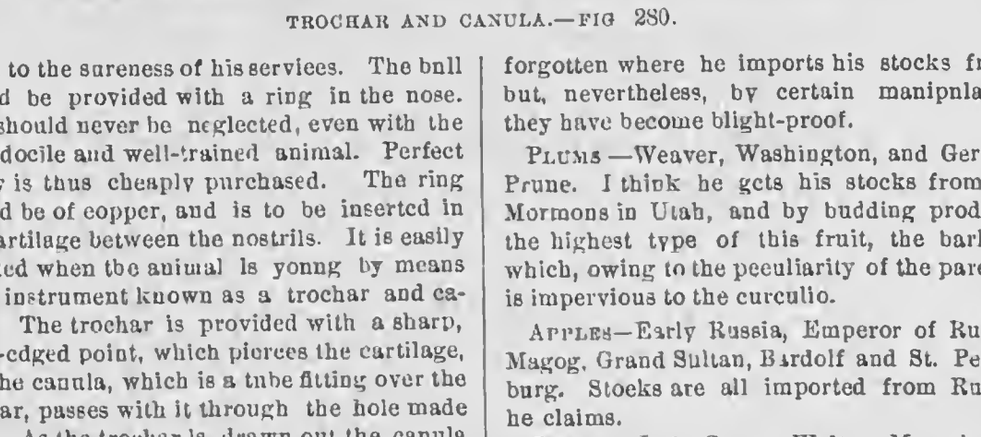


YARD FOR BULL.—FIG. 279.

It is advisable to keep the bull in active work and only moderately well fed. A luxurious, idle life is highly objectionable. Work may always be found for a bull on a dairy farm. He may be trained to work in a horse-power and do the churning and the fodder cutting. He may be harnessed to a cart and haul feed from the fields, or do considerable light work in many ways. This will keep him docile and add much to the sureness of his services. The bull should be provided with a ring in the nose. This should never be neglected, even with the most docile and well-trained animal. Perfect safety is thus cheaply purchased. The ring should be of copper, and is to be inserted in the cartilage between the nostrils. It is easily inserted when the animal is young by means of an instrument known as a trochar and canula. The trochar is provided with a sharp, three-edged point, which pierces the cartilage, and the canula, which is a tube fitting over the trochar, passes with it through the hole made by it. As the trochar is drawn out the canula is left in the hole, when one end of the open-jointed ring is inserted, and this is drawn through with the end of the canula. The ring is then closed and fastened with a screw riveted at the end, to prevent it from coming out. The annexed engraving—Figure 280—shows the form of these instruments. A strong staff made of tough hickory, furnished with a spring hook at the end, is used in handling the bull, and the constant use of this keeps the bull perfectly docile and quiet. The animal should never be led out without it. It is also advisable to provide a separate pen and yard adjoining the cow yard, for the bull. A high and tight board fence, nailed on the inside of the posts, should be built around the yard, and a convenient door made in it, through which a cow may be led into the yard. The plan, Fig. 279, shows the arrangement in the writer's yard, which has been found convenient. The pen is furnished with a feed trough, supplied from the passage in the front, and a strong ring-bolt is fixed near the feed trough for tying the bull when required. But it is never found necessary, as he is always quiet, secure, and easily managed in this safe confinement.



TROCHAR AND CANULA.—FIG. 280.



ARRANGEMENT FOR USING THREE HORSES ABREAST.—FIG. 281.

Pomological.

FRUITS FOR SOUTH CAROLINA.

I was visited a few days since by a nursery drummer or tree peddler, representing the "Fairmount Nurseries" of Troy, Ohio, George Peters & Sons, Proprietors. The drummer exhibited colored plates of fruits and flowers, and also samples of fruits in alcohol. His tongue worked as if it had been hung amidships and flapped both ways; but as I have been a constant reader of agricultural papers, I was a little shy of the gent, and while apparently taking all he said for truth, I determined to have some better evidence of the suitability of his wares to our climate before I made any purchase—hence this letter. I give herewith a list of his varieties that suited my fancy:

PEACHES—Alexander, Downing, Foster, Reine de Vergers, Crawford's Late, Salway and Hopkins. He avers that they import the stocks of wild Canadian peaches, set them out and bud upon them with native varieties, which causes the peach so produced to bloom some three weeks later than the usual kinds, and makes it especially adapted to the South. The Hopkins, he claims, is the largest peach in existence, and he declares it reproduces itself from the seed.

PEARS—Souvenir du Congres—fruit weighs two to two and a half pounds—Brockworth Park, Louise Bonne de Jersey, Beurre Clairgean, President, and Doyenne d'Etc. I have forgotten where he imports his stocks from, but, nevertheless, by certain manipulation they have become blight-proof.

PLUMS—Weaver, Washington, and German Prune. I think he gets his stocks from the Mormons in Utah, and by budding produces the highest type of this fruit, the bark of which, owing to the peculiarity of the parents, is impervious to the curculio.

APPLES—Early Russia, Emperor of Russia, Magog, Grand Sultan, Bardolf and St. Petersburg. Stocks are all imported from Russia, he claims.

GRAPES—Lady Grape, Walter, Moore's Early, Croton, Lindley, Rodgers's No. 9; Early Dawn.

CHERRIES—Olivet, Mammoth, Biggarrean, Toronto. I have forgotten where the stocks are imported from.

GOOSEBERRIES—Woodward's Whitesmith.

CURRANTS—White Grape and Long-branched Holland.

STRAWBERRIES—Sharpless.

RASPBERRIES—Thwack. I simply ask that you examine the list, and inform me which, if any, are suitable to our climate, and also tell their qualities. My soil is mostly a clay loam with a red clay subsoil, but a part of the plantation is sandy with a clay subsoil. W. F. C.

Mar's Bluff, S. C.

REMARKS.—Alexander and Downing resemble each other. Both are early and of good quality. We have no information as to whether they will succeed with you. Foster is late and good: succeeds well in S. C. Reine de Vergers is an old French peach, but little known in this country. Crawford's Late is large, yellow, juicy and good; succeeds well in S. C. Salway is yellow, of fair quality; medium late. We do not know that it has any record in S. C. We know nothing about Hopkins. Many peaches reproduce themselves quite nearly from seed. We should doubt the statement as to the wild Canadian peach. Souvenir du Congres is a very large pear of fair quality. One pear was raised by Ellwanger & Barry weighing 21¼ ounces. It was figured and described in the RURAL NEW YORKER June 5, 1875, and again in the issue of March 30, 1880. It is of too recent introduction to have much of a record anywhere. Brockworth Park resembles the Bartlett, and is of good quality. It often cracks badly. Louise Bonne de Jersey ripens in mid-Autumn here. It is very productive. It is one of the few sorts that succeed well on quince stock, that is, as a dwarf. It is not of the first quality, but really ranks among the first for many merits. Beurre Clairgean succeeds well in S. C. It is late, large, very handsome, sometimes good, but notably variable. The President is a very large pear, roundish-obovate; flesh yellowish-white, rather coarse, juicy, slightly vinous. The tree was raised by Dr. Shurtleff, of Brookline, Mass. We have no record of it in S. C. Doyenné d'Eté is a very good Summer pear, succeeding well in S. C. The claim that it is blight-proof is absurd. The Washington Plum is large and very good. We doubt if it will succeed in S. C. Just the same may be said of the German Prune. The statement as to the curculio is not true. We know nothing about the apples named, except the Magog, which we suppose is the same as the Magog Red Streak, a Russian apple figured and described in the RURAL of January 24, 1880. The others also, judging from their names, seem to be Russian, and these kinds were imported, not for the temperate or warm climate of the South, but for the cold Winters of the extreme North. The Walter Grape has the reputation of thriving nicely in S. C. The Lady (white), Moore's Early (black), and Early Dawn are comparatively new. They are all very good kinds where they thrive. There are many kinds of Biggareau Cherries. We know nothing of the others named. Late Duke, May Duke and Morello would suit your climate best for cooking kinds. Woodward's Whitesmith is a large, green foreign kind. It will not thrive in S. C. White Grape and Red Dutch are good kinds of currants. The Sharpless has done well in several parts of S. C. that we know of. In one place, however, it did not thrive at all. The Thwack Raspberry we have been trying to drive out of the market since it was tested by us several years ago, before it was offered for sale. The berry is nearly tasteless; bush not fruitful. It suckers frightfully. Turner, Caroline, Cuthbert are good kinds.

Sheep Husbandry.

DOGS AND SHEEP.

SOME years ago I accompanied a drover who took a flock of 100 Leicester and Cotswold sheep to one of the richest and best settled parts of Indiana. They were a fine lot, and it was expected they would be readily bought by the farmers in that section. But we were told it was almost useless to attempt to keep sheep on account of the dogs from the villages. Upon a close investigation, however, I came to the conclusion that the farmers' dogs, in all probability, were just as bad as the village curs, and that they had themselves to blame, in part at least, for their losses in sheep. Throughout that whole section I did not see a single canine that had either the appearance or the action of a good farmer's dog. There were hounds of all sorts, setters, spaniels, pointers, bulldogs, Newfoundlands, crosses of the above sorts and mongrels of every description; but not a solitary shepherd or collie. In the sweeping denunciations generally written against dogs, the whole lot are declared to be unmitigated nuisances that should not be tolerated on the face of the earth; but with our utilitarian views why not make exceptions. The Scotch collie is a valuable and faithful assistant on the farm, and during varied and somewhat extended observations on this class of dogs, I have never heard of a single instance where loss has resulted by ravages on flocks, committed by them. It cannot be denied, however, that a cross between this breed and the sporting dog or Newfoundland, is very apt to become a sheep-killer. The true collie has been inured from generation to generation to the tending of flocks and herds and has acquired the habits proper to this service. It is as natural for him to watch and attend generally to the care of cattle or sheep, as it is for the hound to chase the fox, or for the bulldog to hold on when he has once firmly fixed his teeth. As a companion, the collie is faithful and affectionate, and with his intelligent look and symmetrical form, his beauty is surpassed by none. With proper care in training he becomes a most valuable assistant in the management of stock on the farm. FARMER.

METIS-MERINO SHEEP.

THE accompanying illustration—Fig. 282—represents a group of Metis-Merino sheep, the property of M. Paul Bataille, and winners of the first prize for this breed at the recent live stock show at Paris, France. M. Bataille farms over a thousand acres at Passy-en-Valois, and is one of the most successful breeders of Metis-Merinos, the formation of which breed was begun about 60 years ago by his grandfather, by a careful selection of rams of the purest Merino blood. From the first no other blood has been permitted to mingle with the Merino, although some time back, owing to the width of the chest of sheep of this breed, it was reported that at some time an English dash of Leicester or Cotswold blood had been introduced. To settle the question, M. Gustave Heuzé, a French agricultural inspector, was charged to examine the animals and their pedigrees, and pronounced them to be perfectly pure.

At present M. Bataille's flock is composed of over 1 200 sheep, and 200 rams are either sold or let every year. At their first appearance at the Paris live stock shows they obtained the medal of honor, and they have maintained their high reputation ever since. The following technical details will enable amateurs to judge their respective merits:—

1876. First prize for 3 sheep, weighing 683 lbs.
1876. " " " 15, same age, 2,823 lbs.
1877. " " " 3 ewe lambs, 14 months, 507 lbs.
1878. Second prize for 3 sheep, 13 months, 518 lbs.
1878. First prize for 15 ditto, 2,738 lbs.
1878. " " " 3 ewes, 588 lbs.

The three last were retained for slaughtering, that the commissioners might verify the meat-producing qualities. Each heart was found to give an average of 64 per cent. of meat. With regard to the wool, the sheep produce 13 pounds per fleece, and the rams from 15 to 17 pounds, of very superior quality. Our illustration has been re-engraved from the Live Stock Journal (England).

AN ARRANGEMENT FOR DIPPING SHEEP.

THE arrangement for dipping sheep here illustrated I have found very convenient. A, is the heater which can be made of inch-and-a-half plank closely fitted and strapped across with hoop-iron. The bottom should be of sheet-iron, and the heater should be placed on a furnace a foot and a half high, so as to leave room for a brisk fire. Strips of iron should run across under the pan to support the weight. B, is the dipping vat, twenty feet long, five deep and three wide at the top and one at the bottom which slopes upward to the draining pen, so that the sheep can walk out. This vat should be set on a level with the ground. C, is the draining pen which should be on sloping ground, or be raised near the the chute. D, is a form of chute that is much used in California and maybe elsewhere. It should be 16 inches wide for Merinos. The best material for it I have tried, is smooth wire three inches apart supported by posts at intervals of from four to six feet. E, is the catch pen.

F. is a gate which swings so as to close the catch pen and let the sheep run out of the chute, or swings and catches, closing either way. G. is a partition used in crowding the sheep close to the dipping vat to save time in catching. L. is the gate-way through which the sheep should always be driven except when they are to be driven through the chute, D. The continuation of the line from the gate L. is a dividing fence between the two main corrals and should be made of something that will prevent the sheep in one corral from seeing those in the other. M. and N. are the main corrals.

The Herdsman.

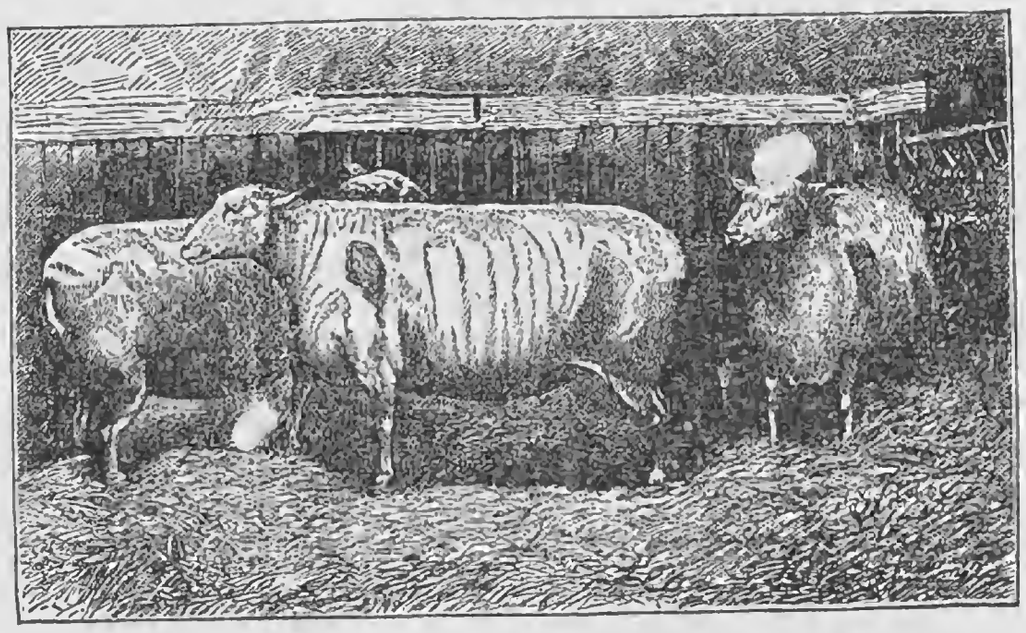
NOTES FROM MY BARNYARD.

"SHEEP will live and do well where other animals starve," but Seth says there is no animal that repays you so well for extra care as the sheep. We have from a one-year-old ram over 15 pounds of wool; from another 12. Last year one of these just bought from a farm flock, sheared about six pounds. They had, besides their hay, an occasional handful of oats; and were most of all greedy for a share of the boiled vegetables thrown in twice a day to the hens. They were also housed very comfortably. During the Summer they are changed every two weeks between two small half-acre lots that open into each other; into these lots we throw additional feed of beets and sowed corn. The one thing above all others that a sheep delights in is beet leaves. I doubt if any one can show a better record than 26 pounds of wool from two sheep.

Seth says he doesn't like animal profanity. "An ugly animal always bellows as if she were swearing," he says. "There, that Ayrshire will never lie down after a good meal and enjoy herself. 'Tisn't in her any more than a Yankee can sit still in a chair. She's always on the look-out for a bit of mischief; and her low is as profane as Tim Burn's execration. I like gentle-spoken beasts."

The other day Seth and I went out to buy sheep. "Let me see their faces," he said; "I can learn all I want to know from their faces. If the face is pinched, or coarse, or wild, or stupid, the body and habits will correspond." Look at five cows in the faces and see for once how character looks out. Let a painter draw an Ayrshire head and a Jersey head and a Durham and a Holstein, and any good judge could construct the rest af the animal all right to fit. He would not get a Durham on a Holstein. More than that, every cow has her individuality in her face. Seth says this is increasingly true of animals that have long associated with man. Bad men degrade stock; good men ennoble them; so that while wild animals of a species average much alike, domestic animals of the same species widely differ. "Cats are not all cats," he adds.

"Talk of heredity," Seth says, "that's something; but it's very early education that does the thing in the barn-yard. There's that mare, she never was unharnessed in her life without pretending to want to eat you up. She learned it when she was three years old—she's nineteen now. Can't cure her. People fool with colts and barn-yard stock that are young, just as they do with babies, and then try to whip the tricks out of them. You see the time to begin training is as soon as they are born."



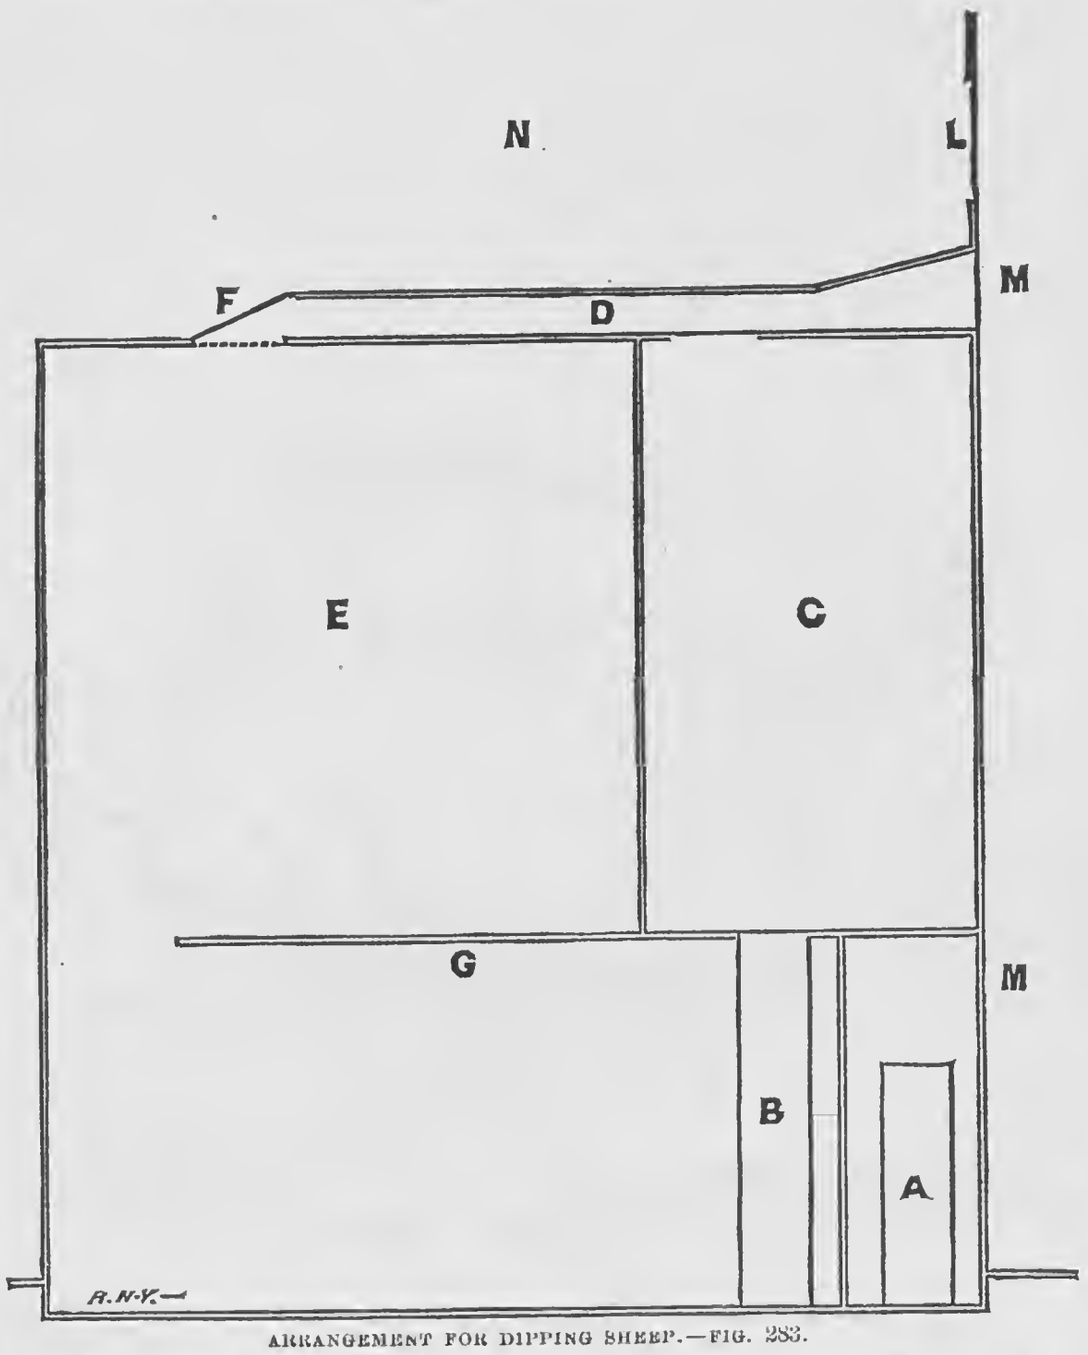
A GROUP OF METIS-MERINO SHEEP.—FIG. 282.

The Horseman.

BRAW LADDIE.

THIS bay Clydesdale stallion was foaled May 14, 1877, and imported from Scotland in 1880 by Powell Brothers, Springboro, Crawford Co., Pa. He was sired by "Tam O'Shanter" (851) winner of first prize at the Royal Agricultural Society's Show at Bedford, in 1874. He by "Rantin Robin" (685), winner of first prize at the Highland Society's Show at Dumfries, in 1870. He by "Bergamie" (44), winner of first prize at the Highland Agricultural Society's Show, at Kelso, in 1863. He by "Johnnie Cope" (417), by "Mulrcock" (550) by "Clyde *alias* Glancer" (153), by "Broomfield Champion" (95), by "Glancer 2d" (337), by "Glancer 1st" (336), by "Glancer, *alias* Thompson's Black Horse" (335) that [illegible] ied about 1810 and was the most noted of all the great founders of the Clydesdale breed.

Braw Laddie's dam "Jean" was winner of the following prizes: In 1872 second prize at the Northumberland Show; first prize at West Lothian; first at East Lothain United; second prize at the Highland Agricultural Society's Show for district of East Lothian; and first prize at Dalkeith Agricultural Society's Show. In 1873 first at United East Lothian Show: first at Highland Agricultural district Show; first prize given by town of Haddington (as one of a pair); first at Berwick, with foal by her side, prize worth £25 ($125); at same show a silver cup valued at £35, as best cart mare at the show; first prize at Richmondshire show, also first prize as one of a pair: first prize at Crook; first at Stockerlay; first at Darlington; first at Colborn; first at Barnard Castle; first at Malton, and first at North Allerton, and several other first prizes. She was by "Campsie" (119), winner of first prize and gold medal at the Highland Society's show at Kelso in 1863; the Fife and Kinross premium two years in succession; the Shotts and Whithurn premium four years in succession, and the Ayr County premium in 1868. He by "Johnnie Cope" (416), winner of first prize at the Highland Society's show at Glasgow in 1857. He by "Justice" (420) by "Prince *alias* Prince Charlie" (603), winner of second prize at the Highland Society's show at Glasgow in 1856; was Brechin Premium Horse in 1851, and Lanarkshire in 1852. He by "Clyde *alias* Prince of Wales" (155), winner of first prize at the Highland Society's show at Glasgow in 1844. He by "Clyde *alias* Glancer" (153), by "Broomfield Champion" (95), by "Glancer 2nd" (337), by "Glancer 1st" (336), by "Glancer *alias* Thompson's Black Horse" (335).



ARRANGEMENT FOR DIPPING SHEEP.—FIG. 283.

TO PREVENT A HORSE FROM CHEWING THE LINES.—Referring to the query on this matter in the RURAL of April 30, our friend, M. B. P., writes from Brookston, N. C. that a good preventive is to soak the lines in pepper tea, or to wet some ground Cayenne pepper and rub it well into the ropes or straps. The same application to the mane and tail of the dam will prevent a colt from biting either. The only effective remedy for a horse's wickedness in eating his blanket is to place it beyond his reach—on some better-mannered horse.

Scientific and Useful.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN NO. 60, MAY 12, 1881.

Fertilizer Analyses.

608. Muriate of potash, from stock of Mapes Formula and Peruvian Guano Co.

609 Muriate of potash, from stock of Wilson & Burr, Middletown. Both the above sampled and sent by Charles Fairchild, Middletown.

* In New York.
† $4.20 per bag of 200 lbs.

The Station is advised by several firms whose character stands high as producers of fertilizers, that the present wholesale cost of the elements of fertilizers is as great as, or greater than, the Station values for 1881; that accordingly, the Station valuations of certain fertilizers, as recently published, are lower than the articles can possibly be made for, and that therefore these valuations are unjust and injurious to the manufacturers, or at least are likely to be interpreted to the prejudice of the latter.

The "Explanations" which accompany the manuscript reports of analyses, and which are printed in the Annual Reports, are believed to be sufficient to forestall such a result. Since, however, the Bulletins may be read by those who do not see those Reports, some passages from the latter are here reproduced:—

"Nearly all of the less expensive fertilizers have variable prices, which bear no close relation to their chemical composition, but guanos, superphosphates and other fertilizers, for which $30 to $80 per ton are paid, depend chiefly for their trade value on the three substances, nitrogen, phosphoric acid and potash, which are comparatively costly and steady in price. The money value per pound of these ingredients is easily estimated from the market prices of the standard articles which furnish them to commerce."

"These trade values of the elements of fertilizers are not fixed, but vary with the state of the market, and are from time to time subject to revision. They are not exact to the cent or its fractions, because the same article sells cheaper at commercial or manufacturing centers than in country towns, cheaper in large lots than in small, cheaper for cash than on time. These values are high enough to do no injustice to the dealer, and accurate enough to serve the object of the consumer."

"The uses of the 'Valuation' are, first, to show whether a given lot or brand of fertilizer is worth, as a commodity of trade, what it costs. If the selling price is no higher than the estimated value, the purchaser may be quite sure that the price is

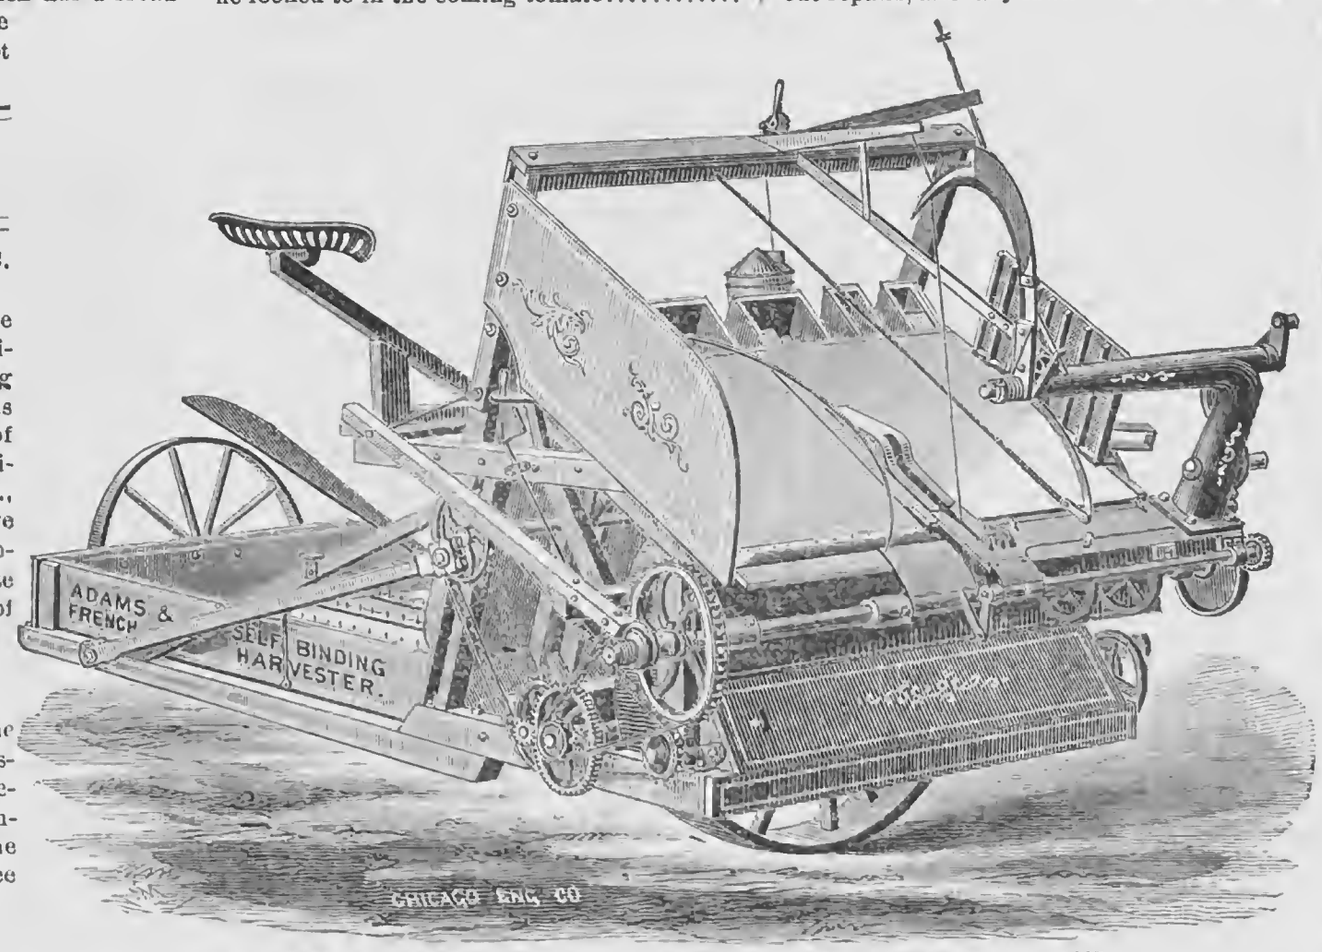
reasonable. If the selling price is but $2 or $3 per ton more than the estimated value, it may still be a fair price; but if the cost per ton is $5 or more over the estimated value, it would be well to look further. Second, comparisons of the estimated values and selling prices of a number of fertilizers will generally indicate fairly which is the best for the money. But the 'estimated value' is not to be too literally construed, for analysis cannot always decide accurately what is the *form* of nitrogen, &c., while the mechanical condition of a fertilizer is an item whose influence cannot always be rightly expressed or appreciated."

S. W. JOHNSON, Director.
New Haven, Conn.

Industrial Implements.

THE ADAMS AND FRENCH HARVESTER
With the Travis Cord Binder.

SO EXTENSIVE must be the employment of cord-binding harvesters in future that it has already become a problem where all the fiber for making the necessary cord is to come from. A first-class machine of this kind should be simple in its construction, so that any intelligent hand can run it, and so that, owing to the small number of its parts, the risk of breakage and derangement is reduced to a minimum. It should be strong enough in every part to bear every strain that may come upon it, without breaking or getting out of order, as the loss or diplacement of a part of a complicated machine generally causes vexatious delay at the best, and at the worst renders the machine worthless at the busiest season. It should he durable, so that the owner may recover hy its use the difference between its cost and that of cheaper implements for harvesting. These three essential requirements of a good machine are combined in the Adams and French Harvester with the Travis Cord Binder, made by the Sandwich Manufacturing Company, Sandwich, Ill. Last year a thorough trial was made of this machine, which at the opening of the harvest was put to work in Texas and kept constantly busy, as it moved north, until the last grain was cut in Northern Dakota. The manufacturers also put it into the hands of a number of farmers in different sections, and whatever imperfections were discovered in its working have been remedied, and all suggested improvements made, so that they offer to the public for the present year a cord-binding harvester which, they claim, is as near perfection as any in the market. The accompanying cut shows not only the binder itself, but its position on the harvester and the connection by which it is driven. As will be seen, it is firmly attached to the frame, and is placed so that the weight is as nearly as possible over the main wheel. There are no gear-wheels about it, except the one shown at the right hand, which is operated by a few cogs on the wheel below it. The binding-arm, with the frame which supports it, the compressor-arm, and the butting-board, with the shaft for driving them, constitute the whole of the binder, as seen from this point. The machine has no straps or belts, no leather or rubber to wear out or to break down. The motion of every movable part is positive and direct, and the sickle, reel, elevators and binders are driven as directly as possible from the main wheel, which has a broad face, and, carrying the whole weight of the machine, is not liable to slip.



THE ADAMS AND FRENCH HARVESTER, WITH TRAVIS CORD BINDER.—FIG. 285.

Miscellaneous.

BOOKS, CATALOGUES, ETC.

QUARTERLY REPORT of the Kansas State Board of Agriculture for the quarter ending March 31, 1881. This contains reports as to the condition of Winter wheat, rye, farm animals, meterological data, &c., and also a very instructive paper by our contributor, Professor E. M. Shelton of the State College, on the tame grasses of Kansas.

J. K. HUDSON, SEC.,
Topeka, Kansas.

QUARTERLY REPORT of the Chief of the Bureau of Statistics, Treasury Department, relative to imports, exports, immigration and navigation of the United States for the three months ended Dec. 31, 1880.

RURAL BRIEFLETS.

OUR readers should bear in mind that pyrethrum powder—sold by seedsmen and druggists—will kill cabbage worms. Professor Cook's experiments show that one tablespoonful of the powder to 40 pounds of flour, or one tablespoonful of the powder to two gallons of water, is fatal to the worms.....

ATTEND to the seedling asparagus bed. Old heds should he thoroughly weeded at this season. A dressing of salt will often serve to keep the weeds down and, away from the seashore, will prove heneficial to the plants. The Rural Farm being upon the ocean, the air is impregnated with salt and its application to any crop produces no appreciable results....

FIG. 284.

WE hope our Northern friends have not ere this sown the Rural Branching Sorghum.....

WE advise our friends not to set out tomato plants too early—not before the first of June for this climate. We cannot change the nature of plants, and tomatoes must have settled warm weather or they will not thrive. The recommendation to wrap a piece of firm paper around the stems when they are transplanted, is a good one as a protection against the annoying cut-worm.....

THE new growth of raspberries and blackberries will soon require support. Let it be considered that the canes merely need protection against strong winds. They should not he drawn so closely as to deprive the leaves and fruit of sunlight and air. A common mistake in tying up tomatoes is that the stems are drawn too closely together, and the same may be said of grape-vines.....

TOMATO cultivators may congratulate themselves that we are not in the future very likely to he pestered with new varieties of tomatoes that are "earlier by ten days" than others. The earliest tomatoes are always of inferior quality, which makes them less desirable than those which were canned the previous season. And people have now found this out and the pink-skinned, sick-looking things that are the first in the market are every season finding a less ready sale. Shapeliness—that is freedom from deep seams—keeping qualities, freedom from acidity: these are the qualities most to he looked to in the coming tomato.....

We find the above in the N. Y. Tribune. Several years ago we thoroughly tested this Pearl Millet both at the Rural Farm and Rural Grounds. We were so impressed hy what certain persons said in its praise that we purchased a large quantity of the seed at a high price and made it one of the packets of our then seed distribution. We have not received one favorable report from the seeds thus sent out, except from the South, where it was already well-known as Cat-tail Millet. Our seasons are not long enough for it. The stalks are woody and though when cut they continue to grow, they cannot be cut until so late that the second growth is next to worthless. We hope there is no danger of another talk about this plant. At any rate, let us again assure our readers north of Virginia and Kansas that it is not even worth a trial.....

WE are glad to see that Gen. N M. Curtis has offered $150 worth of prizes to the farmers of St. Lawrence County for the best yields of Indian corn.....

WE have from time to time spoken of all the prominent lawn mowers of known excellence. A few weeks ago the Pennsylvania was sent to the Rural Grounds for trial. This is not a new lawn mower, but the only one of well-known make that we had not tried. It matters little in how many respects a mower may excel, it must be *durable* or it is a failure. It should endure constant use, if careful, not less than three years without repairs, and any lawn mower that would not stand such a test we should not care to recommend. The reputation of the Pennsylvania is that it excels in this respect, as well as in simplicity of construction, light-running qualities, and last, though not least, in the fact that it will cut taller grass than many others. Except as to its enduring powers, of which, of course, we have had no experience, we find that it is in fact just what is claimed for it....

PROFESSOR KNAPP writes, in the Iowa Homestead, against Pearl Millet for forage in that State; It is as coarse as Western corn-stalks, and as difficult to cure; sweet corn would be better for soiling, and if it has the advantage seedsmen claim for it of furnishing two or three cuttings each season, "Mammoth Clover" meets that condition. But it does not seem to establish these claims for itself, as appears from the following statement of personal experience at the Agricultural College: "Last year we selected a warm and very rich piece of ground on which we sowed one pound of Pearl Millet seed; at harvest there were twelve large Cat-tails—much like swamp Cat-tails, fully as coarse—these were cut and preserved. Afterward the millet sent up a few leaves, but not enough worth calling a second crop."

What Others Say.

SPEAKING of the Department of Agriculture under the direction of Dr. Loring, the new Commissioner, the Nation says:—"We trust that in his hands the Department will quietly establish its claim to higher public estimation, which it will best do by sustaining and strengthening its scientific corps. For example, the present entomologist is a most indefatigable investigator, whose two years' service, it is hardly extravagant to say, shows more solid results than can be gathered from the entire previous history of the Department. His volume on cotton insects is, for one year's work, a marvel of industry and originality."

TRICHINÆ RATHER SCARCE.—The New York Sun alludes to the fact that the Department of Natural Science in the State University of Iowa has been examining pork for the purpose of ascertaining what proportion of that raised in the State was infested with trichinæ. One hundred different pieces from as many different hogs were inspected without finding a single specimen of trichinæ, or any evidence that this parasite was present. This is certainly a good showing for Iowa pork, and upon a careful investigation it will probably be discovered that trichinæ are not so very abundant as many persons have supposed them to be.

MR. W. I. CHAMBERLAIN concludes an article in favor of tile-draining as follows:—"But it never should be forgotten that tile-drainage is not needed on lands that have a gravel or porous sub-soil; and that, even on soils that do need it, drainage is only the basis for good farming, and will never pay unless followed by good farming."

ONE reason that is known to us, says the London Field, why rearing poultry in very large numbers fails is, that where large numbers of fowls are kept together, the place becomes tainted with decaying manure, and disease and failure are sure to follow."

E. P. ROE remarks in the Christian Union that varieties of strawberries that thrive well on light land will thrive equally well, and often better, on strong, heavy soils, but the reverse is not the case. If he were limited to one strawberry, his choice would be the Charles Downing. It succeeds everywhere, is very productive, even under rough and careless culture, and the quality of the fruit is excellent. He does not know a variety with the flavor of the Downing, that will produce as much fruit with the same culture.

THE POTATO possesses the property of converting a very much larger portion of the manure ingredients of the soil into human food, than any of the cereal grain crops: for instance, to every bushel of wheat about 100 pounds of straw are grown, while the haulm of the potatoes when dry is so light, that in our experiments we do not think it worth while to weigh it. These properties, when combined with a suitable climate, enable the cultivator to produce, upon a given area of ground, a larger amount of human food from the potato than from any of the cereal grain crops. So writes Dr. Lawes in his series of articles in the London Agricultural Gazette.

A WRITER in the same journal remarks that many labor-saving implements have of late been introduced, but judging from what one not unfrequently sees, the men appear to regard these things as intended to save their bones and muscles rather than their employers' pockets.

AMBER SUGAR CANE AS A FODDER PLANT.—Mr. Henry Stewart calls attention to the Amber Sugar-cane as a fodder plant. It is, he says, remarkably sweet, but not very leafy, and the stalk is hard and stiff; nevertheless, a full-grown stalk 11 feet long, has been taken by the butt by a horse, and chewed and swallowed completely to the end. From its certain prospective value as a source of sugar and sirup of domestic manufacture, it is a crop that should be grown for fodder, for which it is valuable, so that with facility thus acquired it may be easily grown for sugar when it is so desired. It is as prolific of fodder and of grain as corn, and the grain, whole or when ground, furnishes an excellent feed for stock.

DAIRY PRODUCTS AND SUBSTITUTES.—Railroads have ruined canals; steam-ships have caused sailing vessels to lie and rot in idleness; glucose takes the place of cane sirup, and on every hand we see substitutions which take the business from one to give it to another. And why should the dairy be exempt? It has no mortgage on the future. It must look out for itself, and if it cannot hold its own in competition with new devices and methods it must go to the wall. If there is not a large opening to receive the enormous product of artificial butter and cheese without detriment to the dairy interest, this must suffer. But we have no fear for this result, at least as yet. [We are quoting from the Ag. Dep't of the N. Y. Times.] There is not as yet on the markets a tithe of the butter and cheese that

can be consumed. Millions of the poorer people in Europe know not the taste of butter, and it may be said with truth that millions of the richer people really have no knowledge of what good butter should be. There is, then, a very large opening for the consumption of a cheap article of food which is unobjectionable in regard to its wholesomeness when properly prepared, and which fills the place which cannot be occupied by dairy products. All that the dairy interest can demand is that the new product shall sell upon its own merits and under its own name.

THE AMERICAN BANNER ROSE, according to a writer in Vick's Magazine, is now almost universally acknowledge to be, in this country, a decided failure, wanting in vigor, fullness, perfume, and prolific bloom; while in Europe, grown as a budded plant, it is meeting with much favor, and is highly spoken of as regards vigor of growth, reasonable fullness, and profusion of bloom; in fact, displaying in an eminent degree the identical qualities it seems to lack here.

ADVERTISING PAYS. W. W. Rathbone, sweet potato culturist, writes, "I have made numerous sales to your readers."

THERE is more money in righteous apple-culture to-day, I believe, than in orange planting.—Hartford Courant.....The following is the closing paragraph in a letter from Benjamin Disraeli, dated Dec. 28, 1880: "With regard to trees, I passed part of my youth in the shade of Burnham Beeches, and have now the happiness of living amid my own 'green retreats.' I am not surprised that the ancients worshipped trees. Lake and mountain, however glorious for a time, in time weary; sylvan scenery never palls.—Yours faithfully, Beaconsfield.....A stranger in St. Louis, thinking he recognized his coat on the back of a pedestrian, shouted, "Stop thief!" and about thirty of the inhabitants suddenly disappeared down a side street—Boston Post.....Dr. Abr. Robertson prophesied, according to the N. Y Tribune, that the silo system in America will die young. .....How time changes! In the good Old Testament days it was considered a miracle for an ass to speak, and now nothing short of a miracle will keep one quiet.—Wheeling Leader.....According to our respected contemporary, the St. Louis Globe-Democrat, the pedigree of the tree peddler runs straight back to Annanias.....In 1850 the education of each child in Massachusetts cost the public $4.81 per year; now it costs $13.55. This seems all the more remarkable from the fact that Massachusetts' smartest men were educated thirty years ago.—Norristown Herald. .....If we refuse to go halfway in our approaches to others, we have no right to expect them to come more than this distance in their approaches to us.—Morning Star..... Rich buttermilk, that will shorten bread in cooking, is always an evidence of faulty churning, or a fault in the preparation of the cream before it is put into the churn, says Mr. Cheever, in the New England Farmer..... The Herald says: "When a man begins to tumble up stairs every one helps him to get to the top, and when he begins to tumble down stairs all the world seems anxious to have him reach the bottom." The RURAL concludes, therefore, that we may in any case trust the world to help us.....We all like to have full justice done to every other rogue in the world except ourselves.....Transplant—thin—weed—hoe.....Plant bush beans for succession—plant Lima beans, melons, cucumbers. Sow lettuce and cabbage in drills.

Everywhere.

RURAL SPECIAL REPORTS.

Canada.

MT. PLEASANT, Ontario, May 21.—The Winter has been a most disastrous one to peaches; even large plum trees were killed outright. Cherries, peaches and plums will be scarce here this season, and this being the "off" year for apples, they will not be a drug. Grapes, where not laid and covered, have suffered severely—even the Old Clinton, which we have looked upon as hardy as an oak, has in many cases been killed to the ground. Fall wheat will not be much more than half the crop it was last year. Spring grain is coming up well, and Timothy and clover are splendid. We are having cool weather with occasional showers, and the country is looking its best. J. G.

Dakota Territory.

LINCOLN, Clay Co., May 14.—We have had a terrible time here of late, owing to the disastrous floods along the Missouri bottom lands. Quite a large number of old settlers who had lived here for over 20 years, and who had amassed from large to quite respectable fortunes, have lost everything now. Most of them had to quit their homes in haste, saving nothing except their lives and the scanty clothing on their backs. The water and ice swept away our houses, out-buildings, grain, furniture, stock, fences—everything, everything we had worked for during years of hard frontier labor. Now most of us have neither houses nor stock of any kind, nor timber to build or fence with; and many of us have not been able to do any planting or sowing this Spring. In this township alone there have been very distressing losses, the following being the names of some of those who have suffered most severely:—C. Larson, $4,350; H. Gunderson, total loss $3,400; Lewis Iverson & Brother, $3 166; T. W. Thompson, total loss, $3 100; H. J. Hanson, $1,299; G. S. Myron, $1,250; I. A. Iverson, $2 140; H. Lewis, $1,884; L. B. Larson, $1,700; C. B. Larson, $1 575; O. B. Larson, $1,459; John Lewis, $1 488; H. Johnson, $1,466; T. A. Thompson, $1 260; Mrs. Annie Olson, $1.-124; Lambert Vald, $1,072, and a large number of others, whose losses, not estimated, but calculated closely, range under $1 000. Many of us who were quite comfortably well off will have to begin the struggle for a competence anew as poor in worldly goods as when we settled here years ago in the wilderness, or even poorer, with the discouragement of having lost the fruits of our labor for many years taken out of the best part of our lives. H. G.

Florida.

MANATEE, Manatee Co., May 13.—Commencing last Christmas, we have already shipped over 1,000 boxes of tomatoes from this river—the Manatee—and still they are going off. So soon as folks are through with this business they will begin clearing new land, for where one acre has been in cultivation this year, ten will be under tillage the next. The first of the seeds are planted early in September, and planting is kept up a long time afterwards. G. C.

Kansas.

EDGERTON, Johnson Co., May 26.—We are having plenty of rain here now, and crops of all kinds look well. Wheat, however, is not generally looking as well as it was last year at this time. A large area of flax has been sown, and corn is about all planted, and is mostly a good stand. Apples, peaches, cherries and plums will be abundant. Blackberries are considerably damaged. Grapes are good. Raspberries, strawberries and gooseberries were never more promising. Wheat is worth 90 cts.; corn, 33 to 35 cts.; oats 30 cts.; butter, 16 cts.; eggs, 7c. A. B. D.

EL DORADO, Butler Co., May 20.—We are having plenty of rain now, having already enjoyed a down-pour for 36 hours without a moment's let-up. The outlook for crops is good, everything having been put in except millet and flax. Spring wheat and oats look well, but Fall wheat has been badly injured by chinch bugs. Fruit of all kinds, except blackberries, will be full crops. Butter is selling at 15c.; eggs, 8½c; hogs, $5@5 25; corn, 50@55c.; prairie hay, $5 per ton. L. K. W.

Louisiana.

MONROE, Ouachita Parish, May 17.—We have had, during the past Winter, the longest and most severe cold ever known here. Winter opened on November 16 without warning, by sleet and snow—thermometer 18° Fah. The average temperature—two observations *per diem*—from 28 December to 31 January, 35½°; January, 38°; from December 28 to February 14, 38¾°; from January to February 14, 40¾°. The lowest reading was 6° (not exposed to wind) on the morning of December 30th; when exposed to the wind the mercury fell to 2°. There were five snow and sleet storms, and two other occasions on which it sleeted and snowed a little. Ever-blooming roses were killed to the ground, which has never before happened within my knowledge. There was great loss of cattle—frozen to death. The heaviest snowfall was four inches on January 1. Our fruit crop (except berries) was almost completely destroyed on April 2. The last frost was April 15th and Spring finally opened on 16th. Crops are generally backward; gardens two months later than last year. Corn is doing fairly well; cotton feeble. "G."

Michigan.

HART, Oceana Co., May 17.—This Spring has been peculiar. The snow was not gone till April 27, though hills and fields sloping to the south were bare earlier. We had but half a day's rain and a day and a-half of south wind to help get rid of the great body of snow, which measured 23 inches in depth April 10. It was well settled—almost granulated ice. The soil being sandy and free from frost, vegetation soon started, and in the woods the Liver-leaf (Hipatica) showed its bright, cheery blossoms, in proof that Spring was coming, almost before the earth about it was free from snow. The leeks were two or three inches high under the snow, and soon furnished a green bite for the cattle. On the morning of May 8 the forest showed a slight tinge of green and in five days the trees were in full leaf. Though this county is comparatively new, it is rapidly settling. "Land lookers" are numerous this Spring, and the number of "wild lots" is growing less. Wheat is generally looking very well, promising a much better crop than was at first anticipated. Some few fields were plowed and put into oats. We shall have a light yield of apples, but other fruits promise well. Small fruit plants were much injured by the heavy snows of the past Winter. Some are planting corn. During last week we had two very heavy rains, which have made the weather cooler, and on the morning of the 16th there was frost in places. A. H. B.

Nebraska.

AUSTIN, Sherman Co., May 20.—It rains nearly every day. Our prospects are bright. For wages I pay $15 and board for good hands, $8 for a boy, $1.50 for a maid-servant. For boarding the price is $1 a head for cows, $2 for colts. All our hay is sold for $4 a ton. My Osage Orange seedlings, planted in 1880, are nearly all winter-killed. The few left are opening their leaves now. N.

New York.

WATERTOWN, St. Lawrence Co., May 13.—We have had a fine, dry Spring, with ground in good condition for putting in crops, and they are nearly all in except corn. We had but little rain until the night before last when it began raining and has continued up to the present time with but a short intermission. It is quite cool. Grass looks well. Winter wheat was badly injured by freezing and dry weather in March and April. Spring grains are starting finely; a large breadth is sown and the prospect is favorable for a good yield. C. A. G.

FULLER'S STATION, Albany Co., May 21.—Plenty of rain, and crops growing finely. Farmers in high spirits. Some corn is planted—mine isn't. I think the seed would rot, as the ground is very wet. There are a great many apple blossoms in my orchard, as this is my "on" year. Rye is very poor here, the cold Spring having hurt it very much. A. M. L.

Ohio.

BELLEVUE, Huron Co., May 23.—The season is at least two to four weeks late. Everything looks promising. Wheat is splendid. My crop of 50 acres is better than last year at this time. Not more than three-fourths of last year's acreage has been planted hereabouts, however. A great many farmers are now waiting for rain in order to get the ground in good shape for putting in more. There will be a fair crop of all kinds of fruit. Hay was sold last Winter at $16 per ton in the barn and $18 to $20 delivered; corn, 45c; oats, black, 38c; wheat $1.05. The weather is now quite cool and very dry; we need rain to make us all happy. P. R.

Vermont.

TROY, Orleans Co., May 16.—We are having a cool, wet time. Just now it is almost impossible to do anything but plow seed land and fix fences. Some of my neighbors have planted their corn and potatoes, while others have not sowed their wheat. The Lost Nation Wheat is having quite a run about here, and the White Russian is being introduced a little. My Washington Oats are up. Plum trees are in bloom and apple trees are just beginning to leaf out. I think that old Vermont has done her share in the maple sugar business this year. D. A. B.

Virginia.

MIDDLEBURG, Loudoun Co., May 18.—Corn has come up very badly in this vicinity owing, it is supposed, to the germ of the grain having been frozen during the severe cold of the Winter. Of necessity there will be much replanting. The wheat crop presents more flattering prospects since the recent much-needed rains. Cattle were well wintered and went on grass in good plight. W. C. B.

The Querist.

ANSWERS TO CORRESPONDENTS.

Grass in Orchards.

W. H M., Payson, Ill, asks, 1, what is the best grass for a peach orchard; 2, is clover injurious to peach trees.

ANS.—1, The best grass for a peach orchard, or, in fact, for any orchard, is *no grass at all*. While trees are yet young no other treatment can fully supply the place of constant cultivation. With older trees grass may be tolerated, if kept closely fed or cut, and none of it be taken off the ground; but all of it be made a mulch of coarse manure placed about the tree, as far as the roots extend, and cultivated in as it decays. For such purpose the "best grass" is such as will make the least growth. Soils fit for peach growing are not over-rich, and their fertility must be maintained. To accomplish this rye may be sown, to stand over Winter, and to be lightly plowed under in the Spring, before it has grown too tall. Even clover may be used for this purpose, the chief objection being that it should stand over one season, and hence the trees will receive a serious check before the advantage can be realized. The soil may be improved and the ground shaded by growing and turning under a crop of oats, or even of buckwheat; but this should be done early, or else so late as not to occasion a late growth of trees, at least at the North, where all cultivation of peach orchards should be avoided after the early part of August, till the season's growth has become thoroughly matured, and the weather too cool for its removal. 2, Clover is doubtless the worst of all forage crops to be grown in an orchard, especially of young trees. If allowed to grow without being kept down by pasturing, and especially if kept as meadow and the growth cut and removed, will surely ruin any orchard, whether young or old. Indeed, an orchard of not more than five or six years' growth were as well pulled up and consigned to the brush pile at once as to be left standing, year after year, in a sowed crop of any kind, especially clover, the powerful tap roots of which will rob the roots of any tree that may be planted among them. A single crop of oats or barley, and especially of rye, wheat or clover, will be pretty sure to nearly or quite ruin any newly-planted orchard.

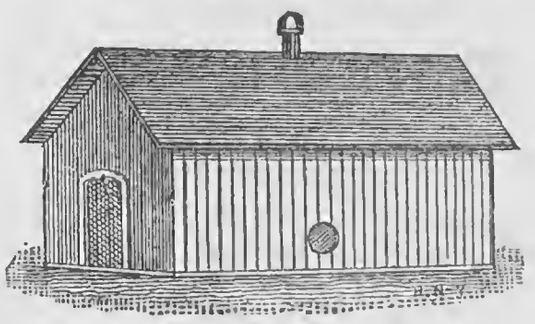
Horticultural Queries.

"*Novice*," *Darien, Conn.*, having met with ill success in raising cauliflowers, asks, 1, how should they be treated and when planted; 2, by sowing seeds of Brussel's sprouts the same as spinach, in August, can he have sprouts very early in Spring, or must the seed be sown in Spring; 3 will a piece of turf turned over after mowing (in July or August) be in condition for setting strawberries next Spring; if so, would it be necessary to plow it again before setting in the Spring or would a thorough harrowing be all that is needed; the meadow referred to, is level and well drained; 4, in our experience is London-purple as effective a "bug" exterminator as Paris-green, and is it any safer; 5, as his White Elephant Potato differed considerably in appearance from that represented in the engraving that was given in the Fair Number of the RURAL, he asks whether it is likely to have been another sort; 6, his Turner Raspberries were for the first time since he obtained them somewhat winter-killed last Winter while the Caroline, though on higher ground, was not harmed in the least.

ANS.—The Cauliflower will not thrive in hot, dry weather. Hand watering, although perhaps of some utility, does not pay at all unless one has but a few plants. Then water thoroughly. Scrape away the soil from the plants, water and then replace the earth when the water has soaked into the ground. We should plant here as early as April 1st. They will then have a good chance to get well rooted before hot and dry weather. 2 No, it is not hardy enough. It must be sown in April and planted out, say in July. 3. Yes, it would. Turn in July if possible. A shallow cultivator and then a harrow would properly fit it for the plants. 4. We used London-purple only last year. It is just as effectual as Paris green, though scarcely less dangerous. It has several advantages over Paris-green: cheapness, adhesiveness, color, for instance, and the one disadvantage that, if used a little too strong, it is more liable to injure the plants. 5. It is the White Elephant. A larger size would have cost us rather too much postage. As it was, the postage on the potato was in most cases seven cents—one cent more than the charge for postage on both seeds and potato. 6. That is precisely our experience, as stated elsewhere.

Keeping Potatoes.

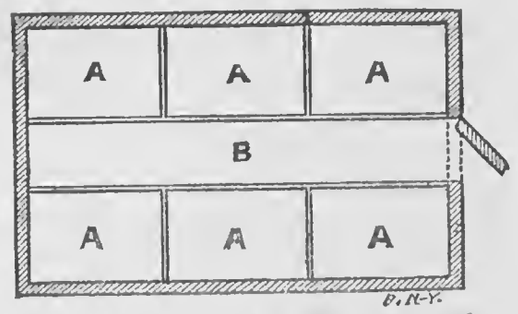
M. V. R., Charleston, Mo., sends us the plan, Fig's. 286, 287 and 288, of a potato house he was thinking of building for the storage of from



ELEVATION OF POTATO HOUSE.—FIG. 286.

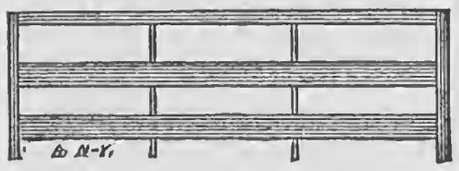
500 to 800 bushels of tubers, and asks, 1, is the plan practicable; 2, to what depth can potatoes be piled in bins or on a cellar floor without injuring them; 3, would potatoes keep better and maintain a more even temperature in cellars if they were covered one or two inches with dry sand; 4, would dry wheat straw well tramped and changed every Fall, answer the same purpose as sawdust for the packing between the walls of a cellar.

ANS.—1. Yes. 2 Potatoes are not injured by being piled up eight or ten feet high, provided they are dry and sound when stored. The horizontal tiers, except the lowest one are useless, if not actually damaging, and a waste



A, BINS; B, PASSAGE-WAY.—FIG. 287.

of room. If ventilation through the body of the pile seems necessary it is better to place, through the middle of the bin, before filling it, narrow open boxes made of slats and reaching from the bottom to above the top of the pile. 3. The principal point in preserving potatoes is to keep the temperature as near the freezing point as possible without letting it fall below



SIDE-VIEW OF BINS.—FIG. 288.

that point. The potatoes should therefore not be covered until the entire bulk has become sufficiently cooled. Afterwards a covering with sand is beneficial. 4. Wheat straw cut short in a straw or feed cutter would answer the purpose fully as well as sawdust.

When to Feed Grain to Horses.

L. M. N., Michigan, asks which is the best time to feed grain to horses—immediately after watering them, or after they have eaten hay a while.

ANS.—Horses are provided with an unusually large development of the salivary glands, and an enormous quantity of saliva is secreted during the eating of a feed of grain or hay. This copious supply of saliva is amply sufficient to moisten and dilute the food, so that it can be digested perfectly without the help of water. Water is absorbed by the coats of the stomach and enters the blood with such rapidity that a thirsty horse will drink in two minutes considerably more water than the stomach will contain at one time, and the water begins to pass off through the kidneys in such a case after the lapse of a very few minutes. So that, knowing these facts, one may reasonably infer that a horse may be watered a few minutes before feeding with more advantage than soon afterwards, because in the former case the water has been absorbed before the food is swallowed, and digestion cannot be interfered with by the presence of too much water in the stomach, as might happen in the latter case. The best practice is that usually followed, viz., to give the horse a very little water on starting out to work after feeding in the morning; to water on coming in at noon and in the evening, before unharnessing and feeding. This gives time for the absorption of the water before the food enters the stomach.

Watermelon and Cantaloupe Culture.

T, P., Charleston, W. Va., asks how to grow watermelons and cantaloupes.

ANS.—New ground from which the brush has just been removed is the best adapted to growing watermelons. Mark out your ground in rows eight feet apart each way, and make holes at intersections of rows, in which put a couple of shovelfuls of yard manure and leaf-mold; then make a hill over the compost in which plant six or seven seeds. When the plants first appear sprinkle them with finely ground bone-meal to keep off the "striped bug." Three vines to the hill are sufficient. It is well to start the seeds in a hot-bed. The culture of the cantaloupe is quite similar to that of the watermelon. It thrives on a thoroughly worked, sandy loam. Mark out the ground in rows five feet apart each way and manure as stated above. Plant about a dozen seeds in a circle on each hill and cover about one-quarter inch deep. When two rough leaves are formed, thin out to three plants in a hill, and when these begin to run pinch them back twice to the third joint. One ounce of seed will plant 25 hills.

Blind Staggers in Pigs.

S H D., Eagle Mills, N. Y., has a sow that staggers about as if she had fits; runs against "things" as if she were blind, and refuses to eat. She has not been shut up, but has been fed on whole corn and swill. She has four pigs eight weeks old and doing well. A couple of years ago he lost a number of hogs by the same disease, and he asks what it is and how to treat it.

ANS.—This pig is suffering from acute indigestion, commonly known as "blind staggers," or stomach staggers. This produces congestion of the brain to a serious extent by disturbing the circulation through the inactive state of the stomach. The remedy is to give a liberal dose of linseed oil, for instance, a teacupful, and repeat the third day; then give some bran mash with a teaspoonful of ginger in it, once a day for a week. The pig has been having too much whole corn no doubt. This is not a good food for pigs as a steady diet, and is dangerous when the pig is not well supplied with water.

Destroying the Apple-tree Borer.

A. F., Durand, Ill., asks how to destroy apple-tree borers.

ANS.—Attend to the matter at once. If they are near the bark, cut them out with the point of a knife. If deeper, use a wire to punch into the hole. The perfect insect may be in the tree beyond the reach of a wire. To prevent it from depositing eggs upon the tree, wash with a mixture of lime-water, aloes, whale-oil soap, carbolic soap, sulphur, etc.; all or several. Color with lamp-black and a little red mineral paint. The stems from a little below the surface of the ground 18 inches up, should be washed two or three times during the Summer. A little soap boiled in with the mixture will give some adhesive power.

Information Wanted about Silo Building.

E. J. H., Scotia, N. Y., says: "I hope to get information from some of the readers of the RURAL on the following question. I have a two-story barn with three large bays 20x24 feet and I would like to convert a couple of these into silos; but not wishing to incur the expense of building a concrete wall, I have thought that by ceiling up the bays with matched plank and pitching the joints, the boarding would do just as well as a brick, stone or concrete wall, as it is only necessary to exclude the air—if I understand the matter aright. I would like to hear the opinion, on this subject, of some one who has had experience with ensilage and is willing to help another in a dilemma."

Miscellaneous.

G. E. N., Afton, N. Y., asks, 1, how to remove a lump the size of a hen's egg from the udder of one of his cows; 2, a remedy for ticks on sheep.

ANS.—A positive prescription cannot be given in a case like this, except from personal examination. This bunch on the bag may have come from being hooked by another cow or it may have received a blow, or been rubbed hard against something. In such a case washing it in water as hot as the hand can bear, every hour or two during the day, may allay the swelling. Or it is possible that it ought to be poulticed, and when it comes to a head by showing a soft, dead-pale spot, like a boil, be lanced and the pus and blood gathered there pressed out. Repeat this pressing for two or three days till the bunch has gone down and that part of the bag has again become soft. Keep the heifer, if lanced, where flies cannot get at the sore, and when it is well cleaned and she is ready to be turned out to pasture, spread a little tar over the wound. 2. As good a remedy as any we know of, and one that is as easily applied, is Little's Chemical Sheep Dip, T. W. Lawford, agent, Baltimore, Md. Or rub the infested parts—usually the side of the neck and the inner parts of the thighs and arms—with some of the following preparation: lard, one pound; flowers of sulphur, two ounces; creosote, twenty drops. A pint of sweet oil may be used instead of the lard.

A. S. C., Anamosa, Ia., has a pure-bred Short-horn Duke bull, six years old, which has been used pretty freely and fed in a stable on hay, corn and oats. Last Fall at fair time he weighed 1960 pounds as a show animal, and about two months ago his weight was 1305 pounds. Within the last couple of months he has served four cows, three of them twice each, and the other, three times, at intervals of about two weeks in each case. He serves without hesitating, but as none of the cows are with calf our correspondent thinks the bull has become sterile and asks whether anything can be done to render him productive.

ANS.—We should not condemn the bull yet. It is not uncommon for cows to "come around" three or four times at intervals of two to three weeks, before they are really served. Give the bull moderate feed of hay (or grass) and oats—no corn. Give him plenty of exercise in a paddock at least ten feet square for at least half of each day. Let him serve the cow after she is well on in her heat—not in the earlier part of it; and let him give her one good leap and one only.

D A. J., Roslyn, L. I., has a horse that seems perfectly healthy, but which persists in a fashion of rolling in the shafts after eating his dinner, although he has been doctored in various ways in the attempt to break him of the habit, and our correspondent asks for some remedy.

ANS.—As we have occasionally seen other horses affected in the same way as that of our correspondent, we have no doubt it is a mere trick with this, as it was with them. We do not think he has any disease, and medicine consequently can be of no benefit. The only way we have been able to prevent a horse from lying down and rolling in harness was to keep his halter on him, and when we stopped, to hitch his nose within a foot or even still closer to the post. This has invariably prevented his lying down or attempting to roll, with us. When such a trick is acquired it is almost impossible to break the horse of it, and it would be better to devote him to plowing and general farm work, where, when stopped to rest, if he lies down in light, loose harness simply, he can do no injury.

J. W., Marion Center, Kan., asks what is the best place to learn telegraphy.

ANS.—In nearly all our large cities there are schools or business colleges in which telegraphy is taught either as a specialty or along with other subjects. Generally they advertise in one or more of the local papers, and there is never any difficulty in finding their location. We have never tried any of them and therefore cannot say which of all of them is the best. The art is taught gratuitously here at the Cooper Institute to those who secure admission to the course of instruction there given, and there is also a considerable number of private institutions where instruction is given in it.

C. W., Evanston, Ill., asks, 1, whether the Kieffer Hybrid Seedling Pear is hardy, and if it is likely to withstand the Winters in Illinois, 12 miles north of Chicago; 2, is the Paradise stock a good one on which to graft apples for village lots.

ANS.—*We* should say not. Let others who have tried it answer. It did not stand last Winter at the Rural Grounds. 2, The Paradise stock is to the apple pretty much what the quince is to the pear; but a given kind of apple grafted on the Paradise is not, as a rule, so prolific as a given pear on quince roots. They are handsome little trees and well adapted for small places.

"*Rural Reader*," *Tioga, N. Y.*, referring to the recipe given for curing mange in a horse in the RURAL for May 13, asks what are the ingredients of the "compound sulphur ointment" there mentioned.

ANS.—Sulphur, six ounces; white hellebore, two ounces; niter, one drachm; soft soap, half a pound; lard, a pound and a half; oil of bergamot, 30 drops. In the writer's young days almost every country druggist kept this ointment already prepared, but of late many of them don't know even the formula for compounding it.

"*Subscriber*," *Cedartown, Ga.*, asks what will kill the little striped "bug" that infests melon plants, without killing the plant also. Last year he tried Paris-green and several other insecticides, but death to the pests was death to the plants.

ANS.—Mr. Henderson recommends several applications of bone dust. We have never tried it. Try Persian insect powder. We last year used London-purple and plaster (proportions, one to 40) for this pest. Our remembrance is that it was effective.

T. P., Charleston, W. Va., wishes to know, 1, if he can be enlisted in the U. S. army; 2, are clothes furnished those who join; 3, where can he do so; 4, what salary is paid; 5, how old must he be for admission; 6, how long must he serve.

ANS.—1, That depends on your physical condition, age, etc. 2, Yes. 3, At recruiting stations in any of the principal cities. 4, $13 00 per month. 5, Between 18 and 36. 6, Five years.

G. G., Dayton, Texas, has carefully planted an acre with peach trees, but the moles are tunneling under the roots and destroying them, and he asks what ought he to do.

ANS.—A few feet from the trees—say six—pour a little coal tar on their tunnels. Beyond, towards the trees, press down the soil that they have displaced, firmly with the foot. Continue this management for a week and please report.

W. D., Union Mills, Ia., asks which crop of Mammoth Clover should be saved for seed—the first or second.

ANS.—Mammoth Clover is nothing but a large variety of the common red clover, and has precisely the same habit of growth. The second crop is cut for seed.

C. B C., Bangor, Mich., asks where machines for grinding sickles of mowers can be procured.

ANS.—Powell & Douglas, Waukegan, Ill., or Watertown Portable Engine Co., Watertown, N. Y.

ASBESTOS ROOFING.—G. W. T., of Stelton, N. J., referring to the inquiry on the above subject in the RURAL of May 7, says he has used this sort of roofing and it has proved entirely satisfactory. He is now using the Asbestos paint and he says it makes a smoother surface and is more easily applied than any other paint he has ever used. He has no reason whatever for recommending it, he says, except the desire to make known a good article.

CARPETS.

MOQUETTE CARPETS.—We have just placed on sale 300 pieces American Moquette Carpets at the low price of $1.40 per yard—the cheapest carpets ever offered. They cannot be had elsewhere in the city.

WILTON CARPETS at $2.25, full five-frame, and equal in quality to anything offered in this market at $2.75 or $3 per yard.

AXMINSTER and MOQUETTE Carpets from $1.50 to $2.50.

Best BODY BRUSSELS Carpets, $1.25, $1.40, $1.50 and $1.60—the latter for the choicest patterns.

TAPESTRY CARPETS.—Having exhausted our first offering of 75 cent Tapestry Carpets, we have placed on sale for a few days, another lot of the SAME GOODS at the SAME LOW PRICE. These goods are equal to those sold elsewhere at 90 cents and $1. We have other goods varying in price up to $1.15.

We have also on exhibition a superior TAPESTRY CARPET, equal in Texture and Quality to anything made either here or in Europe.

INGRAINS—We have of the best Extra Superior Grade a very full line from 75 cts. to 90 cts. per yard. Also, a line a grade lower at 65 cts. to 75 cts. —all wool.

Persons in want of CARPETS will do well to call on us before purchasing. Every Carpet is warranted as represented. Full satisfaction guaranteed or the money refunded.

SATURDAY, JUNE 4, 1881.

Proffessor I. P. Roberts writes us: "I acknowledge myself corrected by Professor Stewart. The article referred to by me in a paragraph in one of your late issues, containing the expression "an easily possible crop is 100 bushels of grain (corn) per acre," was by Mr. Henry Stewart, not Professor E. W. Stewart. I beg the Professor's pardon; the mistake is no less annoying to me than it was to him."

Where potato beetles abound, the shoots of potatoes are attacked and devoured as soon as they appear above the ground. The vines have no chance. Poisons cannot be applied since there is nothing to apply them to. In such case, we cut potatoes in slices, sprinkling them with Paris-green or London-purple, and strew them over the ground. The potato-beetles will prefer the slices of potatoes to the vines, and the new sprouts are thus given a chance.

A contemporary states, in answer to a question, that the Army-worm does not attack corn. This is a mistake. It attacked many corn fields on Long Island last year—one on a farm adjoining the Rural Farm. Several men for several days were employed picking them off, or the crop would have been ruined. They are, in fact, more destructive to corn than to wheat. When the Army-worm attacks the corn plant, we should advise the immediate use of Paris-green.

There is quite as much necessity for barn cleaning on the farm as for house-cleaning, and if farmers were as punctilious about the renovation and purification of the out-buildings as farmerines are about the dwellings, there would speedily be an improvement in the appearance of things; and of conveniences too. Lost, or misplaced tools are brought to light, barn, shed and shop furnishings put in order, space gained and a revival of cheerfulness everywhere. Find time for barn cleaning.

If there ever was a time when people who get their living from the soil had cause to congratulate themselves, it is at the present moment. What with the adulterations that enter into sugar, tea, flour, milk, soda, butter, vinegar, spices and nearly every prepared article used as food and in food, that people buy, it should be an immense comfort to farmers to know that their fare, luxurious or plain as it may be, is wholesome and pure. With the exception of sugar and tea, both of which are much more largely used than necessity requires, farmers can raise their own supplies and escape the slow poisoning dealt out by the grocer. Coffee should be bought green and roasted at home, and as for soda, or baking powders of all descriptions—the housewife who knows how to cook and to prepare food for her family in the best way, will need to use "precious little" of the stuff.

OUR EXPORTS OF BREADSTUFFS.

The exports of breadstuffs from the United States during the ten months ending April 30, 1880, amounted to $233,844,387, and during the ten months ending April 30, 1881, to $225,155,801, a falling off of $8,688,586. In the former period we sent abroad 130,054,110 bushels of wheat, worth $160,876,592, and in the latter, 129,337,068 bushels, worth $143,023,881. A little figuring will show that in the first case the wheat was worth $1.23⅞ cents per bushel and in the second only $1.10½, a difference of 13¼ cents, which on the total wheat export during the last period, amounted to $16,737,061, nearly double the amount of the diminution in the value of all our exports of breadstuffs. Of wheat flour we exported in the first period 4,953,316 barrels, valued at $29,182,323, and in the second period 6,638,264 barrels valued at $37,496,623. Here, too, it will be seen that prices have fallen off; for in the first case the prices averaged $5,97⅓ per barrel, and in the second, $5.64⅞, a diminution of 32½ cents per barrel, or $2,157,433, on the total shipment. Of corn we exported in the first period 72,214,558 bushels, valued at $40,003,639, and in the second, 75,086,895 bushels, valued at $41,194,111, the average price in the first case being 55⅓ cents per bushel and in the second a trifle less than 55 cents. We also sent abroad during the first period 266,693 barrels of corn meal, worth $740,301, or an average of $2.81⅓ cents, and during the second period, 342,280 barrels, worth $996,316, or an average of $2.90 a barrel.

TREE CISTERNS.

It has long been known, through the reports of travellers, that in certain arid districts of Africa water is often found, even in the driest seasons, in hollow trunks of the great baobab tree (Adansonia) and it was supposed that this provision of water was, so to say, natural; but it appears from the investigations of officers attached to surveying parties sent out by the Egyptian Government that these reservoirs are neither formed nor filled by the accidents of nature. They are in reality prepared and filled by the inhabitants of the country who carefully remove the decayed and spongy fiber from the interior of the trunk and laboriously transfer water to the cisterns thus made, bucketful by bucketful, from neighboring pools in which it collects at the rainy season. The importance of these reservoirs is illustrated by the fact that trunks containing 15,000 gallons of water are not uncommon in Kordofan, and that individual trunks have been measured which might store 33,000 gallons. The officers of the survey urge that it would be well for the Egyptian Government to organize a service for the protection and maintenance of these trees on the post-roads and telegraph lines so that couriers, linesmen, inspectors, etc., might always find a store of water. They cite one particular post-route where in times past the people of the country had carefully filled the Adansonia trees during the season of rains, and thus insured water during the dry season for much travel. But when troops were moved in that direction the inhabitants took alarm, abandoned the vicinity and neglected to fill the trees so that the road became as good as impassable.

PARASITES AND THE RESISTANT THEORY.

In order to deal effectually with the various kinds of parasites which infest stock, we should be familiar with their nature, habits and methods of propagation. One class of parasites pass only a portion of their lives in their host; another feed upon the skin and suck the blood of the animals they infest, while yet another, as the internal parasitic worms, live wholly within the flesh, muscles or intestines. There are also parasites of the vegetable kingdom, known as microscopic fungi, from whose attacks no cultivated plants are entirely exempt.

The mission of these parasites seems to be to prey upon, and hasten the destruction of, the feeble, both of animals and plants, while they shun the vigorous and hearty. If the farmer neglects to give his stock the proper care; if scanty and innutritious food is given them, and they are kept in filthy pens and dirty stables; if grooming is neglected, innumerable hordes of parasitic enemies will attack the poor brutes, which, for want of strength to resist their attacks, become the natural prey for parasites both internal and external. The very immediate connection of such diseases as foot-rot, thrush, mange, etc., with a want of nutritious and sufficient food is a matter too often overlooked by the stockman, while he wonders why it is that his cattle and horses are so often victims to these various diseases.

We wish, therefore, to call the attention of our farmer-readers, especially, to what may be termed the resistant theory which assumes that these fungoid diseases and parasitic enemies may be largely, if not wholly, averted by generous feeding, proper care and sufficient exercise of stock. With due attention to these things we strike at the source of possible disease by seeking means of the prevention rather than remedies for the cure of parasitic diseases, of whatever name or nature.

A GREAT WESTERN CANAL CONVENTION.

During the past week a convention of prominent Western men, interested in cheap transportation, has been in session at Davenport, Iowa, with the object of promoting the improvement of the present Illinois and Michigan Canal and its extension from Hennepin, on the Illinois River, to the Mississippi River at Rock Island, a distance of 65 miles. Now the canal extends westward with a slight trend to the south from Chicago to La Salle on the Illinois River, a distance of 96 miles, and it is proposed to utilize the slack-water navigation on the river over the 19 miles between La Salle and Hennepin, and then strike across the country in a westerly direction to the Father of Waters. The design is to have the canal 60 feet wide at the surface, 36 feet at the bottom and six feet of water, with locks 150 feet by 21. When the project is accomplished the Upper Mississippi and the vast agricultural territory of the Northwest will have water transportation to the seaboard, by canal from Rock Island to Chicago, thence to Buffalo by way of Lakes Michigan, Huron and Erie, and thence to this city through the Erie canal and Hudson River. It is figured out by those who advocate the scheme that the cost of transportation from St. Paul, Winona, La Crosse, Prairie Du Chien, Dubuque and other up-river towns to Chicago would then be reduced fully 50 per cent. from the present rates by rail or rail and water—a great gain to the rapidly increasing population of the great Northwest.

In view of the great importance of this link in the internal water communication of the country, it is proposed to ask Congress for an appropriation of $4,500,000 to complete it as a national work. Against such a grant it may be urged that, although the work is conceded to be of great importance, still only the Northwestern States and especially Illinois and Chicago, will be directly benefited by it, and that, just as New York had to build the great length of the Erie Canal at her own expense, because she was to be the chief beneficiary by it, so Illinois should complete this little bit of canal which cannot cost a tithe of the outlay made by this State on the Erie. Surely it will not be said that Illinois is poorer now than New York was when the Erie was built? It is in contemplation here to widen and deepen the Erie Canal enough to allow the passage of ocean-going vessels, is the General Government to be asked to pay the cost of this improvement, on the principle advanced by our Western friends?

Then again, producers in this section strongly object to pay anything towards providing the means by which the products of the low-priced lands of the West can be still more cheaply put in competition in the home markets with the products of the high-priced lands of the East; for it cannot be denied that already Eastern farmers are suffering from Western competition in agricultural products only a few degrees less than are the farmers of Great Britain.

Moreover, while it is unquestionably of interest to the whole nation that the products of any part of it should reach foreign markets at the least possible cost of transportation, yet it is of no consequence to the people at large by what particular route this is effected, and, so far as we have seen, it still remains to be proved that transportation to Europe by way of the lakes, the canals, Chicago and New York, is cheaper than by way of the Mississippi, and New Orleans. On the completion of the canal, however, the Western farmer is likely to be benefited more by the possibility of cheap rates of river transportation, for in the present absence of competition, middlemen and freighters take all the profit.

On principle we are strongly opposed to grants of public money or land by the General Government for projects which are to benefit particular persons, corporations or sections. We believe that by far too much of that sort of thing has been done in the past, and we shall contribute our share towards the formation of a public opinion which shall prevent such grants in the future. In the present case we are decidedly of opinion that the canal should be completed by the State of Illinois; but we are still more decidedly of opinion that it should be completed. The competition of water with rail is of vast importance to the public all over the country in the way of lowering rates, and the importance of it is increasing daily with the growing monopoly created in rail transportation by the frequent consolidation of competing lines. The completion even of rival water routes is also a benefit in the same direction—and so long as millions are yearly appropriated by Congress for the "improvement" of petty creeks, streams, pools and harbors, we see no reason why an appropriation should be refused to a work of such wide importance. So long as public money is lavishly spent to benefit Little Peddlington, why should it not be economically spent to benefit the great Northwest?

BREVITIES.

We are glad to know that Prof. A. E. Blount intends to compete for the Rural wheat prizes.

From our extensive everywhere correspondence and from the various reports we have seen in other publications, we judge that the general prospects for the crops of 1881 are not unfavorable.

The owners of the flotilla that, early in April, carried nearly 700,000 bushels of grain along with other freight from St. Louis to New Orleans, are reported to have boasted that they had cleared $70,000 by the trip—more than the entire outfit was worth. As stated in our issue of May 21, it is said, on good authority, that wheat can be carried from St. Louis to Liverpool for 12½c. a bushel cheaper by way of the Crescent City than by way of New York. This is quite a large margin of profit for somebody. Who gets it? Do the farmers who raise the wheat shipped by this cheaper route get any of the 12½ cents, or do middlemen take the whole of the sum—down to the half cent?

Mr. E. H. Libby has had "hard luck," as the saying goes. He founded the Scientific Farmer which was not a brilliant success. Then he was made the editor of the Broadway Agriculturist, and we judge he was happier when he got out of that than while he was in it. Then he founded Land and Home which, to our mind, was a bright, sparkling little paper. It failed for want of funds to establish it. Now, we see, he is the agricultural editor of The Farmers' Review of Chicago. Well, the Rural has wished him success in all of his several undertakings and now it wishes him success again. We have always thought that there "was something in that young man" and now, let us hope it will have a good chance to come out.

A cablegram last Wednesday announced that M. Tirard, the French Minister of Agriculture and Commerce, in answer to a question put by a member of the Assembly, stated that he was not yet prepared to raise the embargo on importations of hog products from this country, inasmuch as examination still showed the presence of trichinæ in some of the imports. Unless the cablegrams erred soon after the imposition of the embargo, M. Tirard then promised to permit the importations so soon as qualified inspectors of pork had been appointed at ports of entry and at the chief markets. It has taken a long time to appoint these—for a willing government. Wouldn't it also be well to inspect French pork with a view to forbid its sale absolutely in case trichinæ were found in any of it? Surely American trichinæ cannot be more dangerous than the Gallic sort.

In view of the fuss that is constantly being made in this country over every little appropriation sought for in behalf of the agricultural interests of the nation, it would be well to compare the sums appropriated by our Republic and by the "effete" monarchies of Europe for the advancement of agriculture. The latest general statistics on this subject at hand are those of 1877. In that year France appropriated $20 534 410 for Agriculture and Commerce; Russia, $14,826,184 for Agriculture and Public Lands; Austria-Hungary, $5,495,125 for Agriculture; Prussia, $2,612,340 for Agriculture; Italy, $2 715 095 for Agriculture and Commerce; Great Britain, $795,690 for Agriculture; Sweden, $651,739 for Agriculture: the United States $174 686 for Agriculture—less than a quarter of the appropriation made by Sweden with an area 21 times less than that of this country, and a population about one-twelfth as great!

All over the country the agricultural sufferers during the last Winter found some consolation for its severity in the hope, generally felt and frequently expressed, that its unusual rigor would destroy or greatly diminish some of the multitudinous species of insects that injure vegetation and the farmer. From present indications this hope appears to have been fallacious. Reports from most parts of the country declare that insect pests are already unusually numerous and destructive. In the East the potato beetle and the Army-worm seem to be particularly aggressive, and chinch bugs and other grain-harming pests in the West and Northwest. Late reports from Colorado say that the State is also threatened with a grasshopper plague. In the frontier States and Territories some apprehensions are already felt of a locust visitation. A hot season, with dry westerly winds, is specially favorable to the easterly movement of these voracious pests. In view of the fact that the loss from this scourge is calculated by the Entomological Commission that lately investigated the matter, at upwards of $45,000,000 in 1874, a like visitation this year would be ruinous to the afflicted region and disastrous to the nation at large.

The recent alarm in this city at the diversion of a good deal of the Western grain trade to New Orleans, was doubtless unduly increased by what is mildly called a "joke upon the brokers." It seems that a short time back some unknown parties in the Crescent City sent despatches to the principal Eastern ship brokers, as well as to others in Liverpool and Antwerp, instructing them to engage all the available tonnage in their respective ports to export grain from New Orleans. Fortunately most of the craft here were already engaged, and some of those idle were unwilling to risk a southern voyage, yet several steam and sail vessels were chartered at the Eastern Atlantic ports and others in Europe. Some of these started at once in ballast for the Mississippi, but on their arrival it was discovered that the orders for tonnage were bogus, the leading ship-brokers in whose names they were sent promptly repudiating them. Accordingly rates of freight dropped heavily as the supply of tonnage was enormously in excess of the freights seeking transportation. Whether the misleading forgeries were the work of some designing rascals who plotted for cheap rates of freight, or of those pests of society, "practical jokers," who, according to the habit of their tribe, were eager for a little foolish "fun" at the expense of others, has not yet been discovered. It is to be hoped the culprits will soon be detected and severely punished if the trick was a swindle, and still more severely if it was meant for a "joke."

Literary Miscellany.

REMORSE.

EDGERTON.

THERE lived a good old man, some years ago—
How many, just, is not for me to know,
But this, perhaps, will little difference make,
As no important interests are at stake:
The facts which in my story I relate,
Remain the same, without regard to date:
Suffice to say, he lived in years gone by,
Omitting here the *Anno Domini*;
Nor can I mention his particular name,
But still insist, the facts remain the same;
When he was born, or where he chanced to live,
Are facts which I shall not attempt to give;
Nor, is it necessary to my plan,
To specify the color of the man.
He may have been as fair as you or I,
Or, like the ace of spades, of darker dye;
These minor things are foreign to the facts,
I speak not of the man, but of his acts—
But as my muse has shied and "flew the track,"
I'll bear upon the bits and bring her back.
This man—of whom I first set out to tell—
Was honest as the day, and kind as well,
His motives, all, were good and strictly pure,
And knowingly, he did no wrong, be sure;
But then again, the man, try as he would,
Could never, somehow, compass any good;
His plans, whatever he might chance to lay
Were always sure to balk, or go astray;
He seemed possessed of energy and pluck,
But somehow, never had a bit of luck;
While all his neighbors round were doing well,
He, far behind in worldly goods had fell.

At last, in moody, melancholy fit,
The man resolved this unkind world to quit,
Took down a vial of poison cold, and shook it,
Poured out a great heroic dose and took it.

Post-mortem observations proved the fact,
The man had done a very foolish act;
The only real cause for his remorse,
He'd always hitched his cart before the horse.

VIOLET'S WAGER.

[Concluded from page 358.]

"Tell me now," pleaded Violet, "and perhaps I can help you."

"Help me, indeed!" exclaimed Miss Franks. "The only way you could help me would be to marry my brother."

"My dear Miss Franks," said Violet, laughing, "how can I do that when he is engaged to some one else, I think you told me?"

"No, I did not," returned Miss Franks, sharply; "I never mentioned anything about it; but that's my trouble. He has proposed to some young chit no more fit to be his wife than—than——"

"I am," put in Violet.

"Thank you, my dear!" exclaimed Miss Franks, pulling her toward her and kissing her affectionately. "If she were one quarter as suitable as you, I should not mind."

"But," argued Violet, with diffident boldness, "how do you know that your brother has chosen unwisely? Perhaps, when you see more of the girl he loves, you will like her as well as you do me."

"Never!" rejoined Miss Franks, emphatically. "I have never loved any young person as I have learned to love you. No one could have resisted such unfailing kindness. I only wish that, when this hateful marriage takes place, I could have this room for my own. I shall have to find some home near."

"Do you really mean that you would like me to be with you always?" asked Violet, with sparkling eyes.

"Indeed I do, dear, I could not be so much with you without discovering that a home with you must be a happy one—without feeling the charm of your brightness, your sweet temper, and utter unselfishness."

"Thank you!" said Violet, earnestly, pressing Miss Franks's thin hand caressingly to her fresh young face. "And now," she added, "as you have told me your trouble, I will tell you a secret. I am going to be married in the Autumn."

"Oh, dear!" exclaimed Miss Franks.

"But my marriage need not form an obstacle to your coming to me; for we shall have two comfortable rooms to spare. We had hoped that a favorite sister of my future husband would have lived with us, but she has declined. She thinks I am too young and inexperienced to be able to make a home comfortable."

"She's a fool, then," curtly replied Miss Franks, "and can't know you. I certainly know something of housekeeping, and I consider you an excellent manager. If I could only live with you, I should think myself a fortunate old woman, indeed: but then there's something about you no one can resist."

"John's own words," thought Violet, triumphantly. "Well," said she, "we will talk this over to-morrow, when perhaps aunt will be well enough to see you. And now will you promise me something? Will you come down for a little time after dinner? Dr. Franks says you may; and I want to introduce some one to you. You must guess who it is;" and, with a saucy nod of her pretty head, she was gone.

After dinner Miss Franks without waiting for Violet, made her way down to the drawing-room. A fire was burning cheerfully, and on a small table near an easy chair was placed a fragrant bouquet of spring flowers, tastefully arranged. Violet entered in a few moments, looking radiantly happy, and, coming up to the old lady, kissed her, saying impulsively: "Promise always to love me as much as you do now."

"Bless the child!" exclaimed Miss Franks looking in amused surprise at Violet's beaming eyes and flushed face. "Is that the barefaced way you make love to that unfortunate man you have made your slave?"

"There he is!" cried Violet, as a knock was heard; and darting from the room, she left Miss Franks to smile over the impetuousness of lovers.

The afternoon was so lovely that she was tempted to open the creeper-covered window which overlooked the garden, and breathe the balmy, Spring air and sweet scents.

Presently voices beneath the window attracted her attention.

"I must get just one peep at him," said she to herself, cautiously putting her head a little way out of the window. Then she heard the unmistakable sound of a kiss, and Violet's smothered voice, said remonstratingly: "How can you be so rash? Suppose she is at the window? It would be such a pity to spoil it all after my deceiving her so beautifully."

Miss Franks sank back suddenly, with a suppressed exclamation, for she had seen a fine, manly figure bent caressingly toward an eloquent upturned face, two pretty hands clasped on a broad shoulder, a strong arm encircling a slendor waist!

"So she's been deceiving me all this time," murmured Miss Franks—"been carrying on this outrageous flirtation with my brother under my very nose! And to think that he, too, should behave in so dishonorable a manner! But Miss Lloyd shall hear of it, poor, ill-used child! And so shall the other poor dupe."

Here the sound of approaching footsteps made her seat herself at the other end of the room, and the offending couple entered, both looking very innocent.

"I am so glad to see you down stairs," said the doctor, heartily, as he took a chair by his sister's side; "but you look as if the exertion had been a little too much for you."

"I certainly feel more overcome than I expected," replied Miss Franks, primly, adding, with an emphasis Violet's woman's wit detected at once, "I found great difficulty in getting back to my seat after standing at the window for a few minutes."

Violet blushed deeply, and looked reproachfully at John, who, however, was quite at his ease, and ready to be "rash" on the slightest provocation. She saw that Miss Franks was still in the dark as to how matters really stood, and determined, with characteristic courage, to rush boldly to the attack.

"Dear Miss Franks," she began, in her soft, low voice, "will you forgive me for trying, under false pretences, to make you love me? And may I still believe that I have not tried in vain? John, come here." Then, putting her hand in his, she continued with a proud humility new to her: "This is the man I have promised to marry, who has made me so happy with his love, so honored me by his preference."

As Violet paused, John looked at her with loving admiration blended with astonishment.

"But," began Miss Franks.

"One moment, Emily," interrupted her brother, drawing Violet closer to his side. "I, too, have a few words to say. When I told Violet of your probable displeasure at our approaching marriage, she was conceited enough to wager that in less than a month after you knew her you would love her. If she has won her wager—and I see she has—can you wonder at my boundless love? I have had the opportunity of seeing her in private society, in domestic life; I know her forbearing kindness, her tender charity, her sincerity and unselfishness. Oh, my darling," he went on, gazing into Violet's gentle eyes, "I don't know how to thank you for what you have just said! You know how inexpressibly dear you are to me; and, if love, lasting love, can make you happy, happy you shall be."

"Darling," murmured Violet, nestling close to him in her gentle, womanly way, "all the happiness shall not be on my side."

"But," put in Miss Franks, with a bewildered air, "who are you?"

"Violet Lloyd, at your service," replied Violet, recovering her natural gaiety and dropping a mock courtesy—"the 'baby-faced chit' you dislike so much."

"You naughty girl," said Miss Franks, nearly crying for joy; "I'll never forgive you for letting me make an old donkey of myself! Why, you told me youself that your name was Matthews!"

"No," laughed Violet; "I told you my aunt's name was Matthews; and, as you persisted in thinking it was mine, I did not like to be so rude as to contradict you. I hope," she added demurely, "that you do not contemplate altering the plans we discussed this morning."

"Get along with you both, do, and have another walk in the garden. I won't peep this time. I know how it was that my brother paid me such extraordinary attention. Ah, John," she added, earnestly, "Violet has won her wager; but you have won something of priceless value in gaining her love."

SALT AND SUITORS.

"MR. JEWILL, what is to happen? My peace of mind is gone for the evening!" was the half-jesting, half-serious exclamation of a young lady—only just "out," although in the present instance a guest at a large and gay dinner party.

The gentleman thus addressed gazed in comical dismay at his neighbor, and then at a heap of salt which lay before him on the damask table-cloth, and which he had just deposited there by the awkward reversement of a salt-cellar.

"I am extremely grieved, Miss Mordant, to cause you such prolonged distress of mind," he replied, calmly. "But even now I am in perfect mystification as to the exact cause. The purity of the table-cloth is not injured, nor is your fairy-like dress soiled, I hope."

"Worse than that, Mr. Jewill. I really blush for your ignorance of 'useful things worth knowing,'" she replied, archly. "Is it possible that you do not know the penalties that attend the spilling of salt?"

"*Peccavi!* I confess my sins. I really have no idea of such a superstition; and, what is more, I really have no faith in such nonsense," he went on, rather impatiently.

Kate Mordant looked indeed daunted for a moment. She was so young and so unaccustomed to receive any check to her playful fancies, that the rebuff chilled her.

Her other neighbor, however, came to the rescue.

"Do not attend to such heresy, Miss Mordant, but let us rather attempt a remedy for the misfortune. Can we not avert the evil?" asked Mr. Franklin, a more experienced "diner-out" than Charlie Jewill.

"Oh, dear, no! I consider it far too serious for any such precautions," replied Kate, regaining her spirits. "We must only trust in our good fortune to avert any calamity from this event."

Charlie Jewill looked at the fresh, pretty creature at his side with unmistakable, though perhaps somewhat doubting, interest:

"Do you really believe that any harm can come to you, Miss Mordant?" he said, in a low tone. "You look to me like a fresh rosebud with the morning dew upon it, which has neither known a cloud, nor fears a storm."

"Do I look so very juvenile- so very inexperienced, then?" asked the girl, eagerly.

"O, dear no! Only that, meeting you here, I am—what shall I say?—surprised at seeing you at such a gathering of 'grave and reverend seniors,'" he returned, smilingly.

Katie laughed gaily.

"You are a very formidable personage," she said; "but I can very soon explain all your doubts. The fact is, that I am here only as a substitute for a more worthy and dignified guest.

"Is it really your first dinner-party?" asked the young man, eagerly.

"If you mean as a visitor, yes; but I have been drilled into proper behavior," she said, laughingly, "by being present when the table was not full at my own home I hope I have not committed any solecisms of good-breeding?" she added, demurely.

"I am afraid you have committed a more serious robbery than of silver spoons or jewelled napkin-rings," laughed Franklin. "However, it will be time enough to accuse you of the sin when you have refused to atone, Miss Mordant. A sort of hue-and-cry—eh, Jewill? for stolen goods."

Luckily, at that instant the hostess rose from the table, and Katie Mordant was spared the embarrassment of replying, to her no small relief.

The evening progressed as all such evenings do Gossip, music, coffee, ices, contrived to make the next two hours endurable.

And then, rather early in the evening, the carriage was announced which was to convey Mrs. and Miss Mordant to their home, which was some three or four miles from that of their kindly entertainers.

"A pretty, sparkling creature, that. She will ripen well, I expect—eh, Jewill?" said Mr. Franklin, critically. "She will want a little sobering and then she will become a very fine girl, I don't doubt."

Charlie Jewill looked gloriously indignant at the cool commentary on the most exciting hour his own rather phlegmatic temper had known; but he had enough control to reply carelessly:

"Ah! yes, no doubt; only I am wearied enough to prefer some variations from the established rule and plummet. It is rather refreshing to meet a girl who is not as drilled as her own riding-horse to certain paces, in my opinion."

And Charlie turned on his heel, and left the man of the world to his own reflections.

* * * * * * *

"I hope Mrs. and Miss Mordant got home well the other evening, Mrs. Fitzhugh, I understood they lived at the very antipodes of your house," said Charlie Jewill, when he made his duty-call at the house of his hostess, and, what was not so entirely his duty, at the time when he believed she would be at home.

"Well, I can scarcely go so far as to say yes," replied the lady, half-laughingly; "and, what is yet worse, Mr. Jewill, I am afraid you are to be held responsible for the misadventure."

"I, Mrs. Fitzhugh? What unlucky and unknown sin have I committed?" asked Charlie, in unfeigned surprise.

"Well, then, you must judge for yourself. Katie Mordant lost a bracelet—a very pretty bracelet, and, what is more, one that had been left to her by her god-mother and aunt."

"May the old lady rest with Noah! I presume I am not supposed to be responsible for the safety of her heirlooms," returned Charlie, gravely.

"Probably not; but so far as Katie told me, between smiles and tears, when I saw her, she placed the calamity to the account of your having cast some evil spell on her, which terminated in this catastrophe," returned the lady, laughingly, "Whether the omen could extend its power over the bracelet-snap, or the honesty of the finder, it is not for me to say."

And Mrs. Fitzhugh turned to receive some other guests as she spoke.

"Was it really a valuable trinket?" he asked, when his hostess could again turn her attention to him.

"Well, I fancy it had rather a sentimental than a financial-value," replied the lady. "It was a sort of Indian-chain gold band, fastened by a diamond, and emerald, and pearl clasp of curious workmanship. I expect Katie has, or will have, dozens more valuable jewels when the first regrets and reproaches are over. I do not doubt she will get over the scandal and the scoldings. Mrs. Mordant is a little straight-laced, I fancy."

But Charlie Jewill had found a favorable key to the door he was striving to open for his admission, and he soon took his leave, with a brilliant scheme in his head for turning evil into good, and shaping his blunder into a dexterous means of accomplishing his object.

* * * * * * *

"Heigh-ho! that weary bracelet!" exclaimed poor Katie Mordant, throwing herself into a chair as her mother left the room, after a renewed search among dresses and jewel cases, in the forlorn hope of discovering the missing ornament. "As if it could signify, or my venerable god-mother rise from her grave to ascertain its safety! I am sure it was not my fault. It was all that horrid salt being spilt."

"Mr Jewill, if you please, miss, is in the drawing-room, and wants to speak with you; I think it is about the bracelet," said the maid, who waited on Mrs. Mordant and her daughter, and whose entrance had been unnoticed by Katie in her pre-occupation of mind.

The girl colored scarlet.

The little boudoir opened out of the drawing-room by a folding door, and she fancied that Charlie might have overheard her soliloquy.

"Is mamma there, Wilson? Have you told her?" she inquired.

"No miss. Mr. Jewill asked for you, I—I knew my mistress was going to lie down, with a headache, when she went up-stairs. Shall I disturb her, miss?"

"She can scarcely have had time to lie down yet, Wilson. Yes; you had better tell her," was the stupefied response of the embarassed Katie.

And the maid proceeded leisurely to perform the behest.

"Miss Mordant, I really must apologize a thousand times for the intrusion; but the fact is, I heard of your loss, and it seemed to me that this bracelet, which I came across accidentally, very much answers to the description," he stammered, with a hesitation quite equal to Katie's hurried reception of her unexpected guest.

Katie's color rose rapidly.

"Indeed! How very kind of you! Where did you find it?" she asked, quickly.

"First, let me ask your verdict on it," returned Charles, with an enforced carlessness of manner, drawing the little packet from his pocket as he spoke. "The truth is, Miss Mordant, I have felt so extremely penitent for the awkwardness that seems to have heralded your misfortune, that I have left no inquiry unturned to remedy it. I shall never be happy till I have succeeded," he went on, with a significant look that brought a lovely bloom on the girl's cheek.

Katie eagerly unwrapped the dainty paper that surrounded the carefully-packed trinket, and examined it with anxious solicitude.

"It is very like—very like," she said; "but it is not the same, I am afraid. If it is, there will be the initials 'K. F.' on the clasp. They were my god-mother's initials," she went on, perceiving a half-comical, half-triumphant smile on her companion's features.

"I really have not quite so closely examined it, Miss Mordant," he said, coolly; "but you can easily ascertain it by inspecting the place where they should be found."

"Yes, and there is also a little fracture where the link was mended a little while ago," pursued the young girl, anxiously.

Again a look of demure amusement crossed the young man's features.

"You are extremely precise in your description, Miss Mordant. You might have taken lessons from a detective officer," he replied, laughingly. "However, it is in your hands, and I must leave it to your critical decision. Ah! Mrs. Mordant, I see. I hope you are recovering from the annoyance your daughter's unlucky loss must have caused you," he said, suddenly turning to the delicate, formal-looking widow, who was entering the room as he spoke.

"Mamma, Mr. Jewill has brought this bracelet, which he thinks answers to the description of my missing one," broke in Katie, fearing some ebullitions of her mother's well-worn lamentations.

"Indeed! Well, I should know it from a thousand, Katie, and so ought you, when your too kind and indulgent god-mother gave it to you," returned Mrs. Mordant, reprovingly. "Where did you find it, Mr. Jewill?"

The young man shrugged his shoulders.

"Pardon me, my dear madam: I obtained it on condition of keeping all those circumstances a profound secret," he said, mysteriously nodding his head, with a world of meaning in the gesture. "And if it is not the missing jewel, I have faithfully engaged to return it to whence it came."

Mrs. Mordant put on her glasses, and, taking the glittering trinket in her hand, she began to examine it with keen and eager curiosity.

"It is—yes, it certainly must be the same," she said, musingly. "There are the exact characteristics of the bracelet, Katie, though, perhaps, there is a slight difference in the color of the gold. It has more of a bright yellow tint than the precious one you lost so carelessly."

"Perhaps it has been brushed up, my dear madam. There might be very good reasons for that," said Charlie, significantly.

"Well, I am sure we are exceedingly indebted to you, my dear sir; and I quite hope you will remain and share our family dinner, though women's fare will be scarcely worth your attention," said Mrs. Mordant, graciously.

"I shall be enchanted, Mrs. Mordant," he replied. "And I will not spill the salt, if I can help it," he went on, archly, with a glance at Katie.

Charlie remained till prudence warned him not to try Mrs. Mordant's patience any longer.

And that visit was only the first of many a pleasant hour spent with the widow and her fair daughter, till at length Charlie proposed to unite the trio as tenants of one home; and after due maiden's shyness on Katie's part, and some natural reluctance on that of her mother's, the agreement was duly and amiably made, and Miss Mordant in due time was transformed into Mrs. Charles Jewill, and mistress of a handsome house and ample rent roll.

But it was not till long after the magic ceremony that the husband confessed to his fair wife that the bracelet in question had been the production of the jeweler who had repaired the lost legacy of the venerable god-mother, and that the ruse was

graciously forgiven by her as one of the stratagems lawful both in love and war.

"WELL, what do you want here?" remarked Mr. Smith, as he sat up in bed and addressed a professional burglar who stood in front of the bureau: "I want money and bonds," hissed the burglar, through his clenched teeth, "and quick about it too." "My friend," retorted Mr. Smith, "I've been looking for those things for the last 20 years without success but go on with your burglary, I'm sleepy."

BUB'S composition on the rhinoceros: The rhinozerus lives in Azher and you kant stick a pin in 'im cause biz werskit is bilt ov old stoves. Wen a rinozerus iz gonter be kild yu mus alwaze go up to him from before so az he'll kno somethin of it an' try to' mak a place for a bullit to git in. His nose is got a upper teeth that's got no businez ware it iz and if a boy shood set down on it he better sta plugd up with the tooth reis he'll be all won pore. I'd rather be a polliwog if I wuz a rinozerus, tho' I spose if I wuz I woodent.—Yonkers Gazette.

For Women.

CONDUCTED BY MISS RAY CLARK.

ONE AND THEN ANOTHER.

ONE step and then another,
And the longest walk is ended;
One stitch and then another,
And the longest rent is mended
One brick upon another,
And the highest wall is made;
One flake upon another,
And the deepest snow is laid.

So the little coral workers,
By their slow and constant motion,
Have built those pretty islands
In the distant dark blue ocean;
And the noblest undertakings
Man's wisdom hath conceived,
By oft-repeated effort
Has been patiently achieved.

Then do not look disheartened
On the work you have to do,
And say that such a mighty task,
You never can get through;
But just endeavor, day by day,
Another point to gain,
And soon the mountain which you feared
Will prove to be a plain.

"Rome was not builded in a day,
The ancient proverb teaches.
And nature, by her trees and flowers,
The same sweet sermon preaches.
Think not of far-off duties,
But of duties which are near,
And having once begun to work,
Resolve to persevere.

GRADUATING DRESSES.

A REQUEST for hints on graduating dresses appeared in the RURAL recently and having had considerable experience with graduating students, I will make that knowledge the basis of a few kindly remarks and suggestions.

Perhaps the first requisite in selecting any costume is suitability, for this covers occasion, becomingness, comfort, and the station and purse of the wearer. We smile to see women who have passed their first youth, tricked out in juvenile finery; common sense suggests plain attire for traveling and even for church, having the showy and elaborate for entertainments, balls, parties etc.

We dislike to see the freckled, red-haired woman who is fond of pink and orange, and the sallow brunette who admires pale blue above every other color—we dislike to see them ignorantly gratify their uneducated tastes.

Many a tall woman, who could eschew stripes likes stripes and, hence, wears them; while a short, roly-poly figure goes waddling in huge palm-leaves or plaid. And no one admires the daughter of poor parents in feathers too fine for her circumstances, for we cannot but often wonder whether they are paid for or not, or what had to be stinted in order do so.

In the present instance we have girls and young women who have been spending a number of years following a certain course of study, at the end of which they are to take up new work and enter upon new duties. They have not finished as too many superficial thinkers suppose. Commencement means to *commence* with the help of the culture and discipline these years of study have given them; to commence to do better work and lead nobler and more useful lives.

The wiser ones of the world shake their heads at many of the arbitrary frivolities of fashion. Study is expected to make men and women more sensible, to give ballast to their minds, and hence, really well-educated, scholarly women will avoid extremes and showy, conspicuous fashions.

One of the first essentials then for the graduating dress, it occurs to me, is simplicity. By this I do not mean annually recurring rows of white muslin dresses, though for classes of young girls white is always pretty. But colors are also perfectly admissible even for girls in their teens, and for college classes of those more advanced in years, decidedly preferable.

When the class is small, as it so often is in our high schools and smaller seminaries, there is often a desire to rival one another in dress. The platform is an overwhelming temptation to length of train, which is always very dear to the youthful feminine heart, and very often there is a sad discrepancy between the poverty of ideas in the reader's essay and the gorgeousness of her array.

A year ago I attended the closing exercises of a small class, each member of which appeared on the stage. One young lady of seventeen advanced in her turn; she wore a trailing blue silk with over-dress of fine embroidered muslin; elbow sleeves with very long white kid gloves. Real lace finished her dress at neck and elbows and a rich white satin sash banded the waist. The dress was looped in a very stylish manner, and the girl looked very pretty but very much out of place. She began to read and the whole article was barren of thought, it had not a single admirable, enjoyable literary quality. I felt the color stealing into my face and was really ashamed for her. If she had not been dressed so finely the sparseness of ideas in her essay would not have been half so apparent.

I knew another young lady who graduated from one of our best colleges. She was a fine student and a good writer, and she charmed her audience on commencement day though her dress was only an inexpensive cream colored bunting.

Muslin in white or figures, the blue or fawn colors with Silesia linings to match make up very prettily and are useful for other occasions. I have known two classes who chose calico and cambric dresses. For matured college classes silk is always good, if not made up too fancifully, even dark or black silk relieved with white lace ties and ruches is appropriate. Excess of ornament should alwa s be avoided.

Short dresses are now in universal favor. If muslin is chosen for the material, it would look well made with a group of ruffles at bottom of skirt, a prettily draped overskirt, and for a slim figure a surplice waist, the folds crossing the bust edged with narrow lace very slightly fulled. For thicker materials a kilted skirt, drapery caught with shirring bows of ribbon or cords and tassels, a shirred yoke and pointed bodice laced with cord to match the dress or ribbon.

Girls, nobody blames you for wishing to look as well as you can, but do not over dress on commencement day. There is much harm done to the cause of education by the example of those who have been favored with heavy purses. for a poor student has not always the moral courage to stand up in a cheap dress beside her class mate arrayed in elegant silk, and many parents, anticipating the mortification of such a comparison, give up the attempt to send their child to college.

The occasion, too, is very different from a reception or party, the participants should shine according to intellectual attainments, not by display in dress. R. B.

WRITING FOR THE PRESS.

[THE following from the Boston Transcript, so well expresses the feelings and need of newspaper disciples that it bears an insertion here.—R. C.]

Write upon one side of the sheet only. Why? Because it is often necessary to cut the pages into "takes" for the compositors, and this cannot be done when both sides are written upon.

Write clearly and distinctly, being particularly careful in the matter of proper names and words from foreign languages. Why? Because you have no right to ask either editor or compositor to waste his time puzzling out the results of your selfishness.

Don't write in a microscopic hand. Why? Because the compositor has to read it across his case, at a distance of nearly two feet; also, because the editor often wants to make additions and other changes.

Don't begin at the very top of the first page. Why? Because if you have written a head for your article, the editor will probably want to change it; and if you have not, which is the better way, he must write one. Besides, he wants room in which to write his instructions to the printer as to what kind of type to be used, where and when the proof is to be sent.

Never roll your manuscript. Why? Because it maddens and exasperates every one who touches it—editor, compositor and proof reader.

Be brief. Why? Because people don't read long stories. The number of readers which any two articles have is inversely proportioned to the square of their respective lengths. That is, a half column article is read by four times as many people as one double that length.

Have the fear of the waste basket constantly and steadily before your eyes. Why? Because it will save you a vast amount of useless labor, to say nothing of paper and postage.

Always write your full name and address plainly at the end of your letter. Why? Because it will often happen that the editor will want to communicate with you, and because he needs to know the writer's name as a guarantee of good faith. If you use a pseudonym or initials, write your own name and address below it; it will never be divulged.

"These precepts in thy memory keep," and for fear you might forget them cut them out and put them where you can readily run through them when tempted to spill innocent ink. Causer's word for it, those who heed these rules will be beloved and favored in every editorial sanctum.

DRESS REFORM.

BLESS Mary Wager-Fisher for the interest she takes in one subject upon which I have expended much thought, viz: dress reform. For ten years my back has troubled me, and now for the first time in my life I am obliged to do the family washing, so that the pain in my back has become chronic; I therefore feel the need of relieving it of all unnecessary weight. Two years ago I devised almost exactly the union under flannel garment described. and it fits me like a basque. I did it by laying a Butterrick basque pattern and open knit drawers on a paper, and allowed plenty of room between at back; then by paper pattern I cut my red flannel suit bias, which I think wears much better than straight, using narrow cotton tape to sew in with the seams; I think flannel gives better satisfaction made by hand instead of machine. Outside of this I have used the old-time chemise and drawers, not thinking just how to better it, yet feeling the drag of the band of the latter garment on my weak back *constantly*.

Now, I am going to make me a muslin suit after the same pattern, to be worn alone in Summer and over the flannel in Winter, the difference being fuller at the bottom and banded and trimmed to button just above the calf. Then I shall use a "chemise-basque" cut after the loose basque pattern lengthened, so as to ruffle the bottom in lieu of an underskirt, cutting it low neck and short sleeves same as chemise, but will obviate all gathers and bands, by simply having it faced and trimmed. MRS. J. M. MATTHEWS.

DO THEY?

I WAS sitting in a crowded depot; two ladies were sitting near me, when a lady friend of theirs passed with her husband; her countenance and speech both betokening a strong will and an ill-regulated spirit. "What a pity," said one of the ladies to the other, "that that woman never had any children; it would have enlarged her heart so much and given her a more sympathizing spirit with every one around her. I often think what a misfortune it is that she has no little ones to educate her, in spite of herself, to the milder virtues which she now lacks." "Do you believe it?" replied the other. "Such has not been the result of my observation. Children only make a selfish person more intensely selfish, just as it makes a generous one more open-hearted. A parent who is self-willed and devoid of self-esteem will encourage her children in little trespasses on the rights and feelings of others, which a just one would condemn and correct promptly.

"I do not think that children develop every lovely quality in their parents unless they have self-knowledge and rule their own spirits as they ought to." As they rose and passed out of sight I wondered which was right. B. C. D.

STOVE HOLDERS.

TO-DAY I read the article on Stove Holders which was written by "Grandmother," in the RURAL of March 16th. I had never given the matter a second's thought until my mother read it night before last.

If "Grandmother" had known my case, and also my sister's, she could not have hit our particular failing better. And it was only two nights ago I was guilty of one of the acts mentioned in that article, but I won't give you the satisfaction of knowing which bad habit it was, as mother has just finished some new holders, and I have commenced to reform and will try to continue. I hope to hear some more good hints from "Grandmother" through the RURAL.

I will add that in frying eggs they are liable to break when turning them. To prevent this, when they first begin to fry put into the skillet about a tablespoonful of scalding water; then, when the eggs become covered nicely on top, remove into the dish. M. A. C. A.

CORRESPONDENT'S CORNER.

MISS RAY CLARK:—You told a "Rural sister" in last week's issue that rosemary tea would promote growth of the hair. I wish to know if it will darken the hair; also what is rosemary and how to prepare the tea.

Is there anything that will make the hair two or three shades darker. I do not want these patent hair dyes—that is not some of them. Don't you or some of the readers of the RURAL know of something? Are there brushes that come to darken the hair, and where may they be obtained? By answering these questions you will oblige.

M. E. H.

ANS.—Rosemary is an herb. It is defined, "A plant growing in South-eastern Europe, also Asia Minor and China. It has a fragrant smell and a warm, pungent, bitterish taste." It is not a dye and will not darken the hair. We do not know of any brushes but there are leaden combs that will make the hair of darker shade. Any dealer in hair and fancy articles will no doubt be able to supply them.

NOTE.—We have received other requests for information which we hoped to reply to in the current issue, but a delay is necessary to insure accuracy.

It is with pleasure that we receive notes for this corner, for by this means we are better able to do our "mite" of assistance, than if obliged to anticipate the need of friends.—R. C.

We know there is nothing on earth equal to Hop Bitters as a family medicine.—*Adv.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CONCERNING JELLIES AND PRESERVES.

MARY WAGER-FISHER.

I HEAR so much fault-finding among housekeepers anent the glasses with metal covers for jellies and "small" preserves, that I think it worth while to mention it, for the benefit of such as may have it in mind to purchase them on account of their convenience. The complaint is that in putting on and in taking off the cover small pieces are frequently broken from the rim of the glass, which fly into the preserves, which spoils them for anybody who does not wish to swallow so dangerous a thing as a piece of glass. An entirely satisfactory way of putting up jellies and preserves which are to be used in small quantities, is to put them in plain glasses, which cost about 33 cents a dozen—the cheapest sort of tumbler. As soon as the jelly is cold, a piece of white paper, cut round to fit the glass, is dipped in brandy and laid smoothly and closely on the top of the *jelly*, while over the top of the *glass* a piece of muslin is pasted, flour paste being used. Half a pint of brandy will suffice for the preserving of an entire season, unless the quantity put up be large, as a tablespoonful of brandy will saturate several pieces of paper. It is a great economy to make use of the brandied paper, as all the mold which collects on the top forms on this paper, and is readily removed without loss of the preserves. The cost of the brandy is trifling, and it pays for itself many times over when used in this way; so, before beginning to preserve, first secure the brandy.

One year, ants infested my preserve closet and made havoc with some glasses of strawberry and pine-apple, that had only paper pasted over the top, by eating their way through it. I have had no such trouble when muslin has been used. Apropos of brandy: if any one can recommend a substitute for it, that is equally good for topping off preserves, please let us know of it.

Now that rhubarb (pie-plant) is in season, it may not be amiss to remind RURAL readers that it makes a very nice jelly, to be served with meats or spread on layers of cake for "jelly cake." The color of it is fine and the taste excellent, the flavor of the rhubarb being so slight as not to be at all objectionable to persons who do not like it, while being agreeable to persons who do. It is more easily made than any other jelly, which is no small recommendation. After cutting off the leaves, wipe the stalks clean (without peeling); cut into inch-long pieces; put into a porcelain-lined kettle with a very little water—just enough to prevent burning until the juice comes from the rhubarb; cook slowly until the stalks are thoroughly tender; strain, and to a pint of juice allow a pint (which is a pound) of granulated sugar; boil until the mass "jellies," which should be in about fifteen or twenty minutes. Label the glasses you put it in.

Those Tomatoes Again.

I have something more to say concerning "canned tomatoes." Last Fall I canned my tomatoes in the "hight of the season," using Whitall and Mason glass jars, and glass bottles, known as the Rochester beer bottles, that have the patent rubber stoppers. About three-quarters of all the tomatoes put up, regardless of what "can" they were put in, have been found to be sour. In every instance the sealing was *perfect*. Some of the cans were kept in the cellar, some in the attic. The "cause why" some remained good and others did not I have been unable to determine. A lady, who prides herself upon her success as a tomato "canner," assures me that nearly all housewives cook their tomatoes *too much*; that the fruit, after being scalded and peeled, should be slightly cooked—only thoroughly heated; that her own plan is to put the tomatoes in the jars, set the jars in water, and when all come to a boil, scald at once. Her tomatoes have a delightfully fresh taste. I shall try her plan the next time, for after two years of defeat and disaster I am prepared to hang my hopes upon any new idea belonging to the tomato-canning business, that I hear of; and there may be others who will be glad of this suggestion, too.

Lard vs. Butter.

Anaximander lately had occasion to hire a number of workmen, and among them were two German-Poles, three days "landed." They boarded themselves, and "A.," in talking with the German-speaking one about their food, learned that they used lard with their bread instead of butter, and spoke of it as being a great deal better than butter! They much preferred it. It illustrates the saw, "There's no accounting for tastes;" but on this instance, as in many others, it was but the result of habit. The men were good-looking and well-mannered, evidently from the better class of peasants.

OUR GRANDMA.

HELEN BARRISTER.

ON running into a friend's house some weeks ago, I noticed her busy cutting out "blocks" for piecing a bed quilt.

"Are you preparing to piece a quilt?" I queried.

"No," she said. "I am cutting these blocks for work for my husband's mother. We use pieces left from our dresses for this work. She always does her own cutting, but her eyes are weak now, and these colors are trying to them. She is over at Cousin Mark's taking a vacation for a few days not intending to sew a stitch while there, to let her eyes rest. We are getting this ready for her, as she wants the quilt for a present to a fresh aspirant for the honors of housekeeping," and a merry laugh ran around the circle in the sitting-room. At the table sat the youngest girls threading needles with busy fingers guided by bright eyes.

"There, that will do now, girls," said the mother.

"Yes," said one, "we've threaded enough to last Grandma two days, I believe;" and away they scampered for a play in the yard.

"Threading needles for her, too! Why, I never heard of such a thing Do you always thread her needles for her?"

"Not always, but often when we have calls the girls take their Grandma's needle book from her stand drawer, and thread a parcel of needles with colors of thread to match the work on which she is engaged. She says its handy to have them ready for her. It is often a pleasant surprise for her, as she rarely ever sees them doing it, and says 'You dear, thoughtful girls! When did you have time to do this for me?' or some such grateful reminder of her thankfulness for the loving act."

"But where do you find time to prepare work for your mother-in-law? I believe I should get yarn and start her on a knitting crusade for the rest of her life, if I were in your place."

"I do not find time," she said. "I use it daily for all my hands find to do, and have enough left to fix work for a mother that helped to train up such a good son as my husband," and tears glistened in her eyes as she spoke. "She has knitting

for visiting-work, but does a variety of things when at home. She reads, sews, tends the birds, waters the plants, weeds among the flowers, gathers seeds, presses ferns, etc. Knitting is too monotonous for any person, whether old or young. Fancy knitting or crochet work does well for occasional business, but sewing on various materials is better for the mind. You remember Mrs. Corwin's mother did so much knitting that her hands grew deformed and she finally became unfitted to do anything but a little reading and aimless wandering about. No aged person around me will be allowed to do so. Mother makes all her own underwear. Occasionally she makes a pair of sheets, a quilt, and two pairs of pillow-cases for the bed. Last Summer she made pillow and sheet shams, also new curtains and lambrequins for her room. Kate hemmed the ruffles on the sewing machine, but all the rest was done by herself. Her white tufted spread was made two years ago. Anna helped her to make it. Afterwards she made one for a present for Mr. Power's mother, who is blind. She cushioned her large rocking chair, using a dress for her upholstering She covered an old lounge (which she had when she began housekeeping) with another dress and sent it to the Barwell family when they were burned out. She has no old garments, for she is constantly replenishing and frequently giving away. She consults us before giving, and while advising, we never oppose her. She pays a visit somewhere nearly every week. She writes letters often. As her hands are slightly tremulous, she writes only a few lines every day until a letter is finished. We never allude to her increasing infirmities, and mean always to keep her young."

JESSIE SEABRIGHT'S SCRAP JOURNAL.

MAY MAPLE.

THE head of our family is not fond of warmed-over potatoes, even at their very best, and when the new cook, who is only a school girl, brought them to the table, I saw his lip curl, and his nose take on a look that said as plain as words, "The potatoes are not fit to eat." This I well knew would be the case when I saw Susie preparing them. But, then, I thought it was well enough to learn how those outside our own household lived and their manner of cooking the various viands that grace our table. Susie sliced the potatoes, put them in the spider with plenty of warm water and a little salt; when they were warmed through, which did not chance to be very quickly as her fire had burned low, she mashed them, retaining the water, and, of course, they were "pasty," yet the girl had followed the home lessons. The next time that we had potatoes to warm, I told Susie to put some meat drippings into the frying-pan, and let it get hot, and then put in the sliced potatoes, with a good sprinkling of salt, and a little pepper; cover closely till they were well heated through; then stir them up, and set them back on the stove where they would still keep hot without burning till wanted upon the table. The potatoes generally steam enough to moisten them all that is necessary. Susie brought no more "soggy" potatoes to the table.

While visiting with my old friend, Mrs. White, not long since, the subject of washing clothes easily and quickly was discussed. "Just look at that long line of clothes across the road," said she: "how white and nice they look; yet one of her boys has done the washing all Winter; and he is not long about it either. But she has a new recipe for soap, which cannot be beaten. I use the same kind now and will give you the recipe to copy if you would like it. It is as follows:

Recipe for Soap.

Seven pounds of bar soap, (soft will do as well), cut in thin slices and put in a dish. Then put two pounds of sal soda and one pound of unslaked lime in another dish and pour over it two gallons of boiling water; stir this well and let it settle, and pour off the water into the dish containing the soap. Put this on the stove and let it remain until the soap is dissolved; stir well and add one ounce of alum, and two ounces of benzine; cut into bars as soon as cold.

"Soak the clothes" she continued, "about 20 minutes in warm water, add enough of this soap to make a good suds; then wring out and rub all soiled places thoroughly with the soap and put the clothes into the boiler of cool or cold water. Boil fifteen minutes, rub out in the sudsing water, and thoroughly rinse.

The Robins' Washer is nice for white clothes but calicos are seldom improved by boiling.

PUDDINGS.

CHIEF COOK.

THE variety of puddings is immense, and it would naturally be supposed that any "good things," mixed and cooked for the table, would make a good pudding, but we all know better. Still, there are many very poor puddings made and served. I divide puddings into two great families—those which have all their value in themselves, and those which depend entirely on the sauces to be eaten with them. The first is a mere rich feast, the second is an agreeable surprise, which is often better. There are some "hybrids," however, which partake of the best points of both families. Plum pudding and its sauce are both rich; so is a rice pudding with cranberry sauce Boiled puddings, if well prepared, are a proof of skill in the cook—a moment too much or too little spoils them. Baked puddings, having milk and fruit as components, will turn to curd in the hands of a poor cook If there is any part of the cook's duties which must be performed in a manner perfectly cleanly in every point, it is making and cooking a pudding I never mention cleanliness in a recipe as many do, because with most people it is a comparative term, but here it must be not only positive, but superlative. Dirt puddings and pies are only tolerated among children in a mud puddle. The office of a pudding in a dinner, is that of a peace-maker. If there has been any failure in any of the meats, or the vegetables, the condiments, or in the set-out or manner of service, a good pudding restores every one to a contented frame of mind. Therefore, let it be of delicate flavor, not served too copiously, just enough on the plate to cause the guest to dispose of the last morsel with a sigh, and to enable the "lady of the house" to cap the climax by an offer (very pressing) of "just another piece, my dear." Food of the finest and most delicate kinds may be so presented as to spoil the cook's art entirely; to obviate which, the pudding and its sauce should be served together on one plate, a thick sauce at one side, a thin one to be poured on top.

DOMESTIC RECIPES.

Headache.

I find when I have a sour stomach or head-ache, nines times out of ten, it is relieved by taking one-fourth of a teaspoonful of common baking soda at intervals of one hour, which at once relieves the acidity of the stomach; if the head ache still lingers, at night I relieve the over-stocked stomach by retiring without my supper. For with Dr. Dio Lewis I firmly believe there are more people who die from over eating than from starvation.

Feathers Stripped.

As the family increases, each little one wants a pillow of its "very own," and as I have no geese, but use a great many chickens, I have learned to utilize hen-feathers by stripping them. I place them in a pan to dry, with a sieve over them, and then, some odd time, remove all harshness. They do nicely for "up-stairs" pillows.

Sour Rising.

When limited for milk, I keep some corn-meal and water mixed together, which answers the exact purpose of sour milk in soda biscuit, or corn bread.

Healthy Biscuit.

Many of the RURAL sisters may be surprised to know that they can make just as tender soda biscuit by using a little meal instead of grease.

Sweetening Meat.

This Winter I have found by boiling a piece of borax with strong bacon or beef a little soured, it becomes sweetened. MRS. J. M. MATTHEWS.

Dandy Jack Pudding.

To one quart of boiling milk add the yelks of four eggs, one-half cup of sugar, two even tablespoonfuls of flour well beaten. After dipping this out in the dishes you wish to serve it in, beat the whites of the eggs to a stiff froth, add sugar to stiffen, spread this over the pudding and set in the oven to brown.

Plain Pudding.

One pint of milk, three eggs, one teaspoonful of soda, two of cream-of-tartar. Grease pudding pail; pour this in, set it in a pot of water nearly boiling, and boil one hour.

Hard Soap.

We make very good hard soap as follows: Buy resin in balls. To each ball add three gallons of water and two ounces of fine salt. Put the water in a large kettle, let it nearly boil (take five pounds of grease to a ball); then add the grease and resin; stir until perfectly smooth. Keep boiling all the time. Last of all, put in salt; as soon as taken from the fire dip out in wash-tubs and set in cellar to cool. In two days it will be hard enough to cut. A FARMER'S WIFE.

[New York Union.

Did Him Good.

Mr. Charles H. Bauer, editor of the above paper and Notary Public, in a late issue mentions the following: Patrick Kenny, Esq., some time ago, suffered much from rheumatism and tried almost every means to rid himself of this painful evil, but in vain. He was advised to use St. Jacobs Oil, which he did so successfully, that all pain has left him and he is as healthy and strong as ever before. Mr. Kenny is an enthusiastic advocate of St. Jacobs Oil, and it has done him good.—*Adv.*

WONDERS IN MECHANICAL SCIENCE.

What the Davis Vertical Feed Sewing Machine will Do without Basting.

It will sew over uneven surfaces as well as plain.

It will sew over seams in any garment, without making long or short stitches, breaking of thread, or puckering the lining of the goods at the seam, requiring no assistance from the operator, except to run the machine and to guide the work. A point which no other machine possesses.

It will sew a curved piece on a straight one, or two curved edges together.

It will make wide and narrow hems, and hem all kinds of goods, such as soft merino, or goods difficult to hem on other machines.

It is the only practical machine for hemming bias alpacas, poplins, muslins and other similar goods without basting, and it is the only machine in the world that will turn a wide hem across the end of a sheet without pulling the under or upper side of the hem.

It will turn a hem and sew on trimming at one operation.

It will turn a hem and sew in a fold at one operation.

It will do felling bias or straight, on any cotton or woolen goods.

It will fell across seams on any goods

It will bind dress goods with the same or other material, either scallops, points, squares or straight.

It is the only machine that will bind hats, cloaks or other articles with bias satin or silk, from one half to three inches in width without basting.

The only machine that will make and bind cardigan jackets or other knit goods without basting.

It will put on dress braid and sew in facing at one operation, with or without showing the stitches.

It will put on dress braid and sew in facing and a bias fold at one operation, without drawing either dress, braid or skirt, and without showing the stitch on right side.

It will make French folds.

Make French folds and sew on at the same time.

Fold bias trimming and sew on at one operation.

Make milliners' folds with different colors and pieces of goods at one operation.

Make milliners' folds with one operation and sew on at the same time.

It will turn the edge of bias bands and sew on either one or two pipings, and stitch them on the dress at the same time.

It will sew bias bands on a dress and run in either one or two pipings without showing the stitches.

It will cover cord and sew it in between edges at one operation.

It will cover the cords for seams of waists, cushions or furniture covers and sew the seams at the same time.

It will sew in a sleeve, covering a cord and stitching it into the seam at the same time.

It will sew the cord on the edges of military coats, jackets, &c.

It will gather without sewing on. It will gather and sew on at the same time.

It will gather between two pieces and sew on at the same time.

It will gather between two bands, showing the stiches on the right side at one operation.

It will make and sew a ruffle on any part of a dress skirt, and sew on a bias fold for heading at one operation, showing the stitches on the right side.

It will gather and sew on a band with pipings between ruffle and band at one operation.

It will sew a band and ruffle on a dress skirt, stitching on piping at the head of band at one operation.

It will make plaited trimming either straight or scalloped.

Make plaited trimming and sew on at the same time.

Make plaited trimming either scalloped or straight and sew on a band, and edge stitch the band at one operation.

It will make plaited trimming either scalloped or straight, and sew a piping on at the same time.

It will make knife plaiting.

It will shirr any kind of goods.

It will, with one operation for each variety, without basting, execute 20 practical varieties of ruffling, being 12 more than can be produced on any other machine with same number of operations.

It will make a more elastic stitch than any other machine.

It is the only machine that will sew velvet or plush without drawing or puckering.

It does not change length of stitch on scroll work.

It sews from lace to leather without changing stitch or tension.

For tucking, cording, braiding, quilting, embroidering, shoe fitting, dress-making, tailoring and general family use or general manufacturing it has no equal.—*Adv.*

Miscellaneous.

Get These Good Books

The standard, beautiful, and incomparably cheap books of the Literary Revolution are in demand far beyond our resources for manufacturing them. We must manufacture and sell **quickly** immense editions of these books in order that we may afford the low prices, and for our capital to be manufacture and sell of still other standard books for which we are having most urgent demands. If, therefore, you want any of the books named below, **order them promptly,** as we shall after a few days cease to manufacture these editions, and they will then not be obtainable in the market.

While You Can that we may trans-

Books 2 Cents.

News of the Week.

HOME NEWS.

MONDAY, May 30, 1881.

The political fight has been waxing warm this week, and the battle ground has been at Albany. Conkling and Platt have been leading their forces in person, while the "half-breeds," or friends of the Administration, have been led by Robertson. Secretary Blaine has been "hovering around" New York, ostensibly on private business. From the events of the past week it seems evident that Conkling and Platt cannot be re-elected to the Senate by this Legislature, at this session, without the aid of Democratic votes. Beyond this everything is uncertain. It is to be hoped that before the week ends some definite conclusion of this "unseemly" matter may be reached. Just how, it is quite impossible now to state.

The bronze statue of Admiral Farragut was unveiled at Madison Square, this city, on the 25th inst. Jos. H. Choate was the orator of the day. Addresses were made by Ex-Gov. Morgan, W. H. Hunt, Secretary of the Navy, Mayor Grace and others. There was a large crowd of spectators and an imposing military display.

The funeral of Thomas A. Scott, who died on the 21st., took place from the family residence at Woodburn, Pa., on the 24th inst., and the remains were interred at Woodlands Cemetery. The Pennsylvania railroad will drape all their vast property in black for several weeks.

The Cornell University boat crew have been ruled out of the Thames (England) Royal Regatta, in which they were expecting to participate. They did not submit their certificates prior to March 1, according to the rules. They, however, sailed for England and if no arrangements can be made whereby they can enter the race they will challenge the winners to a contest.

The reduction in the cost of the Star Route mail service now reaches the large sum of $500,000. The aim has been to economize by cutting off the extra service contracted for solely in the interests of the "ring." On one route alone $36,000 a year is to be saved, and the people along the line will be served with their mail as well as they were before. There have been some revelations of official looseness in the Treasury Department at Washington during the past week. There seems to be a general renovation going on under the new administration.

Commodore Nutt, the celebrated dwarf, died in this city on the 25th inst. He was born April 1, 1844 at Manchester, N. H. and at the age of 17 was first exhibited by Barnum. At the time of his death he was three feet seven inches tall.

At the annual Sunday School anniversary and parade held last Wednesday in Brooklyn, N. Y. 51,000 children and young people were on the march. The Mayor reviewed them at Prospect Park. It was a gala day for the children.

Mr. William W. Long, president of the Southwestern Immigration Commission is considering the best manner of procuring immigrants for the States of Louisiana, Arkansas and Texas, whose Commonwealths Mr. Long represents. He sailed for Europe Saturday the 21st, and intends to bring back with him or arrange for the coming of several thousand desirable settlers for the Southwestern country, where farmers and agricultural laborers are most in demand. He stated that the railroad companies traversing the three States mentioned have agreed to pay all the expenses of transporting desirable immigrants and will give them land and employment on very desirable terms.

The number of immigrants arriving at New York last week was 9200; the total for the month being 41,611 and since January 1,146,902. The arrivals for May are now estimated at 70,000, and for the year at 730,000.

President Garfield and Secretaries Blaine, Windom, and Kirkwood will take part in the ceremonies in the National Cemetery at Gettysburg on Decoration Day. Gov. Hoyt and staff, with the heads of departments and both Houses of the Legislature, have accepted invitations to be present. Hon Julius C. Burrows of Michigan will deliver the address. The Presidential party will arrive this morning and remain until to-morrow evening.

Here is an indication of how the great West is filling up. One thousand emigrants, en route to the West, took breakfast at the Crestline lunch counter Thursday morning. They filled three trains.

The centennial celebration of the capture of Fort Galphin from the British, during the Revolutionary war, by Americans under Gen. Henry Lee, took place on the 21st. The fort is located on Savannah River, twelves miles below Augusta. An address was made by Col. C. C. Jones of Augusta, a descendant of the founder of the fort, who acted as master of ceremonies.

Jefferson Davis has gone to Canada, in order to be on British soil when his history of the rebellion is published in England, and thus secure an English copyright. This plan is said to be feasible, because he is not legally a citizen of the United States.

Petitions from "thirty States and Territories, representing some 300,000 members of churches and temperance societies," have been presented to President Garfield, praying that orders may be issued forbidding the sale of fermented liquors at forts and posts occupied by the army.

The Yorktown Centennial Commissioners have been offered, for $1,000, a glass goblet out of which Lord Cornwallis drank. Unfortunately, the purse of the Commission is not very heavy; and if much lightened by the purchase of even such valuable historic relics as a glass goblet, at $1,000, it will probably not be adequate to sundry other things of greater importance in the practical celebration.

Ex-Gov. Washburn has conveyed his Edgewood property, consisting of 34 acres, with all buildings and improvements thereon, located on Lake Wingert, a few miles south of Madison, Wis., to the Sisters of St. Dominica, who are to establish an educational institution there. The conveyance is made without consideration, and the gift adds another to the record of the ex-Governor's magnificent public benefactions.

The Texas Pacific Railroad management have asked that a company of United States troops be sent to the western terminus of their road to protect the workmen and property from depredations by a gang of lawless men who have congregated there.

The three million and a-half of newspaper subscribers in the United States pay $26,250,100 annually for the news. The daily papers published in the country number nearly a thousand, but it would be an easy matter to count the great dailies upon one's fingers.

A building is about to be erected in Chicago upon the spot where the great fire of 1871 started, and the Historical Society of the city is taking steps to have a memorial tablet placed upon it, and also to place a tablet or monument at the northern terminus of the fire.

An army of over twelve thousand men draw pay from the Chicago, Milwaukee and St. Paul Railroad company. This is an increase of 2,102 since last June. How these great corporations do grow, and the country is developing to a corresponding degree in the golden Northwest.

A novel race occured in Rochester between Elsie Von Blumen on a bicycle and trotting and running horses. Three straight heats were won by Miss Von Blumen against the trotting horse, and she also won easily in the race with the running horse.

Five hundred children have within the past few days been withdrawn by their parents from the public schools in Atlanta, Ga., on account of a deadly disease which made its appearance there last week in the family of Mr. Perkins, Forsyth Street, carrying off his wife and all his children, three in number, in thirty-six hours. Eighteen physicians are of the opinion that it is malignant scarlet fever. One pronounces it yellow fever, and another poisoning from water.

The international grand lodge of Good Templars is in session at Topeka, Kan. The order comprises 78 lodges and 310,000 members. The next session will be held at Charleston, S. C.

The excursion season has been inaugurated by a terrible accident near London, Ontario. An overloaded steamer went to the bottom with 600 souls on board. About 200 bodies have, up to this writing, been recovered.

An American bark, from Boston, has been unjustly seized by Mexican authorities at Merida, Mexico. This is the first case under the new administration calling for armed interference to maintain the honor of our flag in foreign waters.

Can Eat All I Want.

A dyspeptic who had procured Compound Oxygen, makes this report: "I eat like a farm hand; no more distress in my stomach. *Can eat just all I want and then forget I have a stomach*, until about time for the next meal." Treatise on "Compound Oxygen" sent free DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

A London cablegram of the 27th says that several well-known Scotch farmers are about to start on a tour through this country with a view to obtain information regarding the prospects of agricultural immigrants.....The returns of the commerce of Austria and Hungary for January and February show that the import of wheat exceeded the export by 22,800,000 cwts.....The last panacea for the woes of the British farmer is that he should grow tobacco. A writer advocates its cultivation in the midland and southern counties of England, and asserts that it would yield, if properly grown, a profit of £20 an acre. The cultivation of tobacco is at present forbidden in England, under an old Act of Charles II., and in Ireland by an Act of 50 years ago. Tobacco was cultivated in Ireland for some 30 years previous to that date.... ....After repeated trials at Paris, it has just been decided that 20 eggs count as a kilogramme, or 2 1-5 pounds. The breeds of fowls that lay large eggs, averaging seven to a pound, are La Fleche, Houdans, Creve-Coeurs, and Black Spanish; those laying medium-sized eggs, averaging eight or nine to the pound, are Leghorns, Cochins, Brahmas, Polands, Dorkings, Games, and Sultans; the Hamburgs lay about ten eggs to the pound. Duck eggs weigh from two to three ounces apiece; turkey eggs three to four ounces; goose eggs from four to six ounces.....A cablegram of May 27 says that according to official returns up to the 15th inst. the crops in Bohemia, Lower Austria, North Tyrol and Dalmatia have suffered somewhat from frost. The prospects in the Central and Southern zones are good. In the North wheat promises well. Excellent results are expected from the vintage and fruit harvest....Quail are very abundant in Santa Barbara County, Cal. In some places the farmers are compelled to poison them in order to protect their growing crops. Five acres of Lima Beans were wholly destroyed by these birds on one farm..... ....The Galveston (Texas) News thus speaks of one of the tricks of the trade:—"Some Texas papers print fabulous accounts of the weights of fleeces from Merino sheep. The discount for dust is not given. Texans seldom wash their sheep before shearing or scour the wool afterwards."..... Caterpillars in enormous droves have appeared in parts of New Zealand, destroying field after field of oats. Near Turakina hundreds of thousands of them were passing across the country to a new field for depredations, when they found themselves obliged to cross a railroad track. As a train came along, thousands of them were crushed beneath the wheels, and finally the train was brought to a full stop by the slippery condition of the rails. When the engine and carriages were examined after the stop had been made they were found covered, in many places, inside and out, by the crawling vermin..... Landlords in Scotland have found it a wiser course to reduce their rents than to keep them up at the risk of a possible land agitation. Farms the leases of which recently expired or are soon to expire have been relet at rents varying from 20 to 50 per cent. lower than before. On the estate of Lord Lamington, in East Lothian, where some of the best lands in the country are found, a farm on a former rent of about £1,000 was relet a short time ago at a reduction of over 40 per cent. The tenant is said to be one of the most enterprising and skillful agriculturists in Scotland, but has met with heavy losses of late, and was obliged to stipulate for this reduction before he would take another lease.....

Secretary Allen of the Omaha Board of Trade, estimates the grain crop of Nebraska for 1881 at 105,000,000 bushels, an increase over 1880 of fully 30 per cent. The wheat crop is estimated at 16,000,000 bushels, a gain of about 50 per cent.....The exports of domestic provisions, tallow and dairy products from the United States during April amounted to $8,133,164, against $12,962,672 in April, 1880. For the four months ending April 30, 1881, they were $52,405,350, against $44,286,762 for the same period in 1880. The value of provisions and tallow for the six months ending April 30 was $73,360,712, against $58,484,014 for the six months ending April 30, 1880. The value of dairy products for the 12 months ending April 30 was $23,458,781, against $16,607,950 for the same period in 1880 ..... About Battle Creek, Mich., sheep are dying in great numbers. They appear dumpish, refuse to eat, lie down and die. No remedy yet hit upon. .. ....Upwards of 100 representatives of the Cotton-seed Crushers' Association of the U. S., convened at Cincinnati on May 24 and 25. The object of the meeting was to adopt measures whereby the mills belonging to the association can monopolize the trade and thus regulate the price of seed, and crush out the smaller firms not belonging to the association. Several delegates were expected from Chicago, but they failed to come.....To all present appearances the yield of strawberries along the valley of the Hudson this season will be the largest ever obtained, and the berries will also be larger than those of last year. The first of the fruit will be shipped to the New York market toward the close of this week. The bulk of the crop will reach the market about the 20th of July.....Senator Williams has introduced a bill at Albany to convert the Erie canal into a ship canal by lowering the channel one foot and raising the bank two feet, thus giving three additional feet depth of water, and thereby allowing the passage of propellers of 1,000 tons from the lakes to New York City. Eight million dollars is named as the probable cost of the work, and the constitutional restriction as to the annual expenditure for canal repairs it is proposed to do away with, on the ground that this will be essentially a new enterprise.....The San Francisco Commercial Herald, of the 12th of May, 1881, says: "Wheat crop prospects are brilliant, and the harvest will begin by the 23d. of May, and new wheat from Tulare County will be in market by the first of June. The surplus crop of old wheat is very large.....By advices of May 8, wheat and rye in the south of France had begun to ear. Weather generally favorable for the back crops. .....In Spain the prospects for the cereal crops were satisfactory... ....In Germany the season was backward, but the wheat plant had satisfactory appearance and rye also.....In Hungary and Roumaria wheat was looking well.... ....In Russian Western and Southern Governments the crops appear to be in good condition, but in the Eastern they have fared badly.....

The N. Y. State canals, which were formally opened on the 17th of May, had last Friday delivered at tide-water 451,400 bushels of wheat, 1,766,000 bushels of corn, and 58,000 bushels of other kinds of grain, against, in the season of 1880, to date (the canals then having been opened April 20, nearly a month earlier), 3,195,000 bushels of wheat, 1,921,000 bushels of corn, and 663,000 bushels of other descriptions of grain.....Of wheat, the visible supplies at latest dates stood at 16,561,800 bushels. Of corn, the aggregate is 11,233,000 bushels. At the corresponding date in 1880 the total of wheat was 19,608,500 bushels, and of corn 13,146,400 bushels.....The New Zealand Gazette contains a notice that a bonus of £500 ($2,500) will be given for the first 25 tons of butter and the first 50 tons of cheese produced in a factory worked on the American principle, and to which any farmer, subject to certain conditions, may send his milk, which shall be exported from New Zealand and sold at such prices in a foreign market as shall show that the articles are of fair quality.....

The New York Brazilian line of steamers was withdrawn on the 20th inst., foreign competition proving so great that it had to succumb..... A young man of Indianapolis, Ind., a practical pork-packer, has been astonishing the people of Boston with the operation of a machine that takes the bristles from scalded hogs, scrapes and cleans them at the rate of eight a minute.....The receipts of cattle at the Union Stock Yards, Chicago, from January 1, to May 7, 1881, are reported at 369,591 head; same time in 1880, 445,975; same time in 1879, 386,228, showing a falling off from 1880 of 74,384, head, and 16,637 less than in 1879.....

Exports of breadstuffs from the United States in the ten months ending with April 30, in each of the last two years:

Nutritious Food.

The names of Prof. Horsford and the Rumford Chemical Works (Providence, R. I.) have become so identified with the manufacture and sale of phosphoric acid and the phosphates, that they are justly considered as the highest authority in this country, if not in the world, upon those articles.

The former, (Prof. H.) has made the subject of wheat and its conversion into bread, a life long study, and was the first to suggest the use of the phosphates as a cream tartar substitute, whereby the nutritious elements which are taken from the flour in boiling are restored.

The phosphatic preparations of the above firm have received the hearty recommendations of the highest medical and chemical authorities in this and other countries, so that their healthfulness and utility are beyond question. They have been put upon the market in various forms, the latest, and one which will undoubtedly prove the most popular, being "Prof. Horsford's Phosphatic Baking Powder," which is packed in tin cans like the ordinary baking powders, and is to be used in the same way. It is made from Prof. Horsford's Acid Phosphate in powdered form. It contains the same ingredients, mixed together, as the famous Horsford's Bread Preparation, is fully equal in strength, if not superior, to any of the ordinary first-class baking powders, and is sold at reasonable prices.

The Works have issued for the present year, their "Horsford Almanac and Cook Book," which is sent free on application, and will be found well worth sending for.

THE IMPROVED MONITOR RAKE.—This excellent rake is made by the Higganum M'f'g Corporation, Higganum, Conn. It is a self and hand-dump rake, which is simple and neat in appearance, rakes cleanly, lifts easily and falls back lightly. In construction it is simple and very strong and durable. Special care has been taken to insure that it can be dumped easily by hand.

The Reason Why.

The tonic effect of Kidney-Wort is produced by its cleansing and purifying action on the blood. Where there is a gravelly deposit in the urine, or milky, ropy urine from disordered kidneys, it always cures.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

Women that have been bedridden for years have been entirely cured of female weakness by the use of Lydia E. Pinkham's Vegetable Compound. Send to Mrs. Lydia E. Pinkham 233 Western Avenue, Lynn, Mass., for pamphlets.

Take Hop Bitters three times a day, and you will have no Doctors bills to pay.

A Pure and Effective Hair Dressing.

COCOAINE, a compound of Cocoanut Oil, beautifies the hair and is sure to allay all itching and irritation of the scalp.

THE superiority of **Burnett's Flavoring Extracts** consists in their perfect purity and strength.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, May 28.

Chicago.—WHEAT active, but unsettled and irregular; No. 1 red winter, $1.09@1.16; No. 2 Chicago spring, $1.12½@1.13½, cash; $1 12½, June; $1.14@1.14½ July; $1.11¾ August; $1.08½ September; No. 3 do., 97c.@$1 02½; rejected, 76@82½c. CORN unsettled at 43c. cash; 42⅝c. June; 43¼c. July; 43¾c. August. OATS in good demand at 37⅝c., cash. RYE firm at $1.16. BARLEY firm at 97½@98c. FLAX-SEED, $1.13@1.14½. PORK, $10, cash; $15.90 June; $16.05@16 07½, July; $16 20, August. LARD, $10 55@10 57½, cash and June; $10 62½@10 65, July; $10.65@10.67½, August. BULK MEATS easier; shoulders, $5 60; short rib, $8 25; short clear, $8.75. BUTTER—Creamery, 20@22c. for choice; ordinary, 18@20c.; fair to choice dairy, 13@17c.; white and streaked, but sweet, 8@9c.; grease, 6@7c. CHEESE—New, full creams, 9@11c; part skimmed cheddars, 6@7c.; do. new flat, 4@7c.; do, old and sour, 2@4c. per pound. GRASS SEEDS—Timothy lower at $1 75@2 for common; $2 10@2 20 for fair to good; $2 25@2 40 for extra to fancy. Clover dull at $3 50@4 for common to choice medium; Hungarian at 60@75c.; flax firm at $1 15 1,18 for pure crushing. HOGS—Arrivals increasing, quality good; market fairly active but unchanged; packing dull and weak at $5 50@5 90; good to choice packing and shipping, $5 95@6 25. BACON mainly at $5 85@5 90, a few extra at $6; poor to fair light dull at $5.40@5 65; market closed weak and a few left over. CATTLE—Market steady with a fair demand; exports, $6@6 25; good to choice shipping, $5 75@6; poor to medium, $5.25@5.50; stop fed, $5.40@5 65; butchers' active but weak; scallawags, $2@3; fair to good, $3 25@4 50; choice, $4.75; fair to good grassers, $3 65@4 40; Colorados, $5@5.70; stockers and feeders quiet and slow at $3 50@5. SHEEP—Demand good; quality poor; common to fair shorn, $1.50@4.75; Texans, shorn, $4; best natives, $5.50; best heavy wooled, $6.20@6 50.

Cincinnati.—WHEAT firm; No. 2 Red Winter, $1 12@1 13. CORN irregular; No. 2 Mixed, 48c. OATS strong; No. 2 Mixed, 42@42½c. RYE dull and nominal; No. 2, $1 20@1 24. BARLEY scarce and firm; extra No. 3 Fall, $1 05. PORK quiet at $16 50. Lard dull at 10½c. Bulk meats dull: Shoulders, $5 62½; Clear Rib, $8 30. Bacon quiet and unchanged. SUGAR strong and higher; hards, 10½@11c; New Orleans, 7½@8½c. BUTTER—Fancy Creamery sells at 24@25c, prime do at 22@23c, choice Dairy at 17@18c, choice Western Reserve at 15@16c, prime to choice Central Ohio 12½@15c, medium do 10@12c, and inferior 5@8c ₩ lb. CHEESE—There has been a fair demand, but the receipts being liberal prices have declined to 8½@9½c per lb for prime Ohio Factory, and 8@8½c for good do, but inferior has to be sold at lower prices. NEW POTATOES are in ample supply and fair demand, but prices are lower, with sales mainly at $5@6 ₩ bbl. STRING BEANS are in light supply, and meet a good demand at $2 50@2 75 ₩ bushel in crates. CABBAGE—The market is easier at $4@5 per crate for prime to choice. TOMATOES—Bermuda sell at 75c@$1 per pk crate. CUCUMBERS in good demand at 50c ₩ doz. ONIONS—Bermuda sell at $1 75@2 ₩ bush crate, and New Orleans at $5 per barrel. GREEN PEAS—Home grown are selling at $1 25 00

$1 50 per bushel. Southern not wanted. Hogs—quiet; common and light, $4 50@6; packing and butchers', $5 40@6.

St Louis—Wheat active; No 2 Red Fall, $1 14¾@1 14¾, cash; $1 15, May; $1 14¾@1 15, June; $1 11¾@1 12¾, July; $1 08¾@1 09¾, August; $1 08¾ September; $1 07@1 08¾, all the year; No 3 do, $1 07¾ bid; No 4 do, $1 02¾@1 02¾. Corn 45¾c@45¾c, cash. Oats 38c, cash and May; 33¾c@34c., July. Pork quiet; $15 60. Lard firmer at 10 50 bid. Bulk-meats dull; shoulders, $5 50; Clear Rib $8 40; Clear Sides, $8 60. Bacon firm; Shoulders, 6¾c; Clear Rib, $9 15; Clear Sides, 9 30@9 45. Hogs fairly active; Yorkers, $5 70@5 75; mixed packing, $5 50@5 85; choice to fancy, $5 90@6 15; Pigs, $4 90@5 25. Cattle inactive; exporters, $6@6 20; good to prime Steers, $5 40@5 90; common to fair, $4 90@5 35; butcher Steers, $4 85@5 25; Colorado Steers, $4 90@5 60; feeding steers, $4 90@5 35; corn-fed Texans, $4 30@5 20; grass do., $3 25@4 25 native cows and heifers, $3 25@4 40. Sheep prices nominal at $3 00@4 25.

Hop Bitters purifies the blood, and removes all pimples and eruptions.—*Adv.*

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 28, 1881.

Beans and Peas.—The bean market is quiet as a rule; marrows held with some confidence, but mediums and other sorts are offered freely. Colored beans have a rather better outlet: Green peas slow, stock is poor; quoted $1.55@1.60 ₱ Wis. bbl. Southern B. E. peas nominal at $3.45@3.50 ₱ 2-bush. bag, which is easier.

Marrow beans, prime, $2.55@2.60; other, $2.35@2.45; medium, prime, $2.15@2.50; other, $2.20@2.35; pea, $2.25@2.50 white kidney, $1.50@2.40; red kidney, $1.45@1.65; black or turtle soup $1.45@1.50.

Receipts of beans for week, 4,750 bush.

Exports do. 437 pkgs.

Butter.—The market disclosed a very unsettled feeling yesterday and prices show a marked decline on best grades compared with three days ago. Stock is rapidly going from white to yellow, and with some surplus of the former buyers have been able to dictate and sellers have been forced to comply. Exporters have paid pretty full prices but are not keen buyers at the close as the market seems turning in their favor State continues the lead the best demand, and Western, when sound and sweet, is attractive at the prices for medium-class wants. Firkins are not plenty and quotations are not fixed.

Creamery—Western, good to prime, 20@23c.; Penn. choice, 27c; State, 23c.; poor, 19c.; sweet cream, 20@22c.; State pails and half tubs, choice, 22@22½c.; fair to prime, 19@21c.; Welsh tubs, 18@22c.; poor State, 12@18c.; firkins yellow, 20@22c.; Western imitation creamery, 16@20c.; do. dairy, fine, 19@20c.; other, 14@18c.; factory or ladle-packed best, 15c.; other, 10@13c.

Receipts for week, 35,225 pkgs.; exports, 3,501 do.

Cheese.—The market was a tough one during the early part of the week and it was difficult to say where prices would stop in their downward movement. Since Wednesday the call from shippers has been steadier and prices for best factory have gained ½@¾c. Ohio flat dull. Skims freely offered at quotations.

State factory, fine, 9¾@10c., fair to prime, 8¾@9¼c; poor to fair, 6½@7¾c.; Ohios, fine, 7@8¼c.; part skimmed creamery, 4@5c.; full skims, 2@3c.

Receipts for week, 43 830 boxes.

Exports for week, 52,474 boxes.

Liverpool cable, 55s.

Steam to Liverpool, 15@20s.

Cotton.—There has been quite a long dull term for cotton: Liverpool advices furnish no incentive for speculation. For spinners' use there is a fair demand at the spot prices. The closing prices are firm and quoted as follows:

May, 10.78c.; June, 10.73@10.74c.; July, 10.79@10.80c.; August, 10.8@10.81c.; September, 10.50@10.51c.; October, 10.13@10.14c.; November, 10@10.01c.; December 10@10.01c.; January, 10.12@10.14 February 10.23@10.25. —showing, as compared with yesterday the following changes, all higher May 12@14 points; June 7; July 5. August 5; September 3@4; October 3@4; November 2. December 1; January 2. February 1.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	N. Orleans and Gulf.	Texas.

Strict good ordinary	8	Middling	9 15-16

Receipts for the week, 11,056 bales. Exports do. 11,751 do.

Dried Fruits.—About the only item that moves with freedom is evaporated apples. Further calls from foreign shippers stiffen prices and best marks may soon go higher. Sun-dried are moving but not to a large extent. Peaches are quiet but not pressed upon the market.

Apples evaporated choice 8¾@9c; fair to prime 7¾@8½c North Carolina sliced, common to best 4@5c. Va. do. 4@4¼c; Tenn in bbls. 4¼@4¾c. do. bags 4@4¼c; State fine cut 4@4¼c. quarters 4¾@4¾c; Western, 4¼@4¾c; evaporated peaches peeled 27@30c.; unpeeled 17@20c. very poor 10c; sun-dried peeled 5@5¾c; unpeeled 3@3½c. Plums 12@12½c. Blackberries 8@8½c. Cherries 13@13½c. Raspberries 23@24c. Whortleberries 11¢c.

Receipts for the week, all kinds, 1,540 pkgs.

Exports dried apples, 1,677 pkgs.

Eggs—Receipts for week, 15,300 bbls.; do. last week 15,200 do. Supplies have been comparatively moderate and prices have favored sellers. The market, however is tender at this season, and what might be termed an easy supply one week would prove heavy and lower; especially when eggs show heat in transportation.

Near points, 15¾@16c.; State and Pa., 15@15½c.; Western 14½c.; Canadian, 14½c.; near Southern, 14c.; duck, 15@16c.; goose 22@23c.

Furs and Skins.—Political affairs in Russia have shortened the season on the continent and the market here is very quiet All desirable lots of the catch are thought to be here. The following are the ruling rates for prime No. 1 quality:—

	Nor. & East.	W. & S. W.
Fisher	7.00@10.00	6.00@9.00
Black Bear	7.00@14.00	5.00@9.00

Opossum (trash-out)	... .	11@ 14
Muskrat, spring	16@ 18	14@ 15
Muskrat, winter	12@ 15	10@ 12
Muskrat, fall	9@ 11	8@ 10

Flour.—Receipts for week, 101,670 bbls; exports, 50,200 do. Receipts corn meal, 4,300 bbls.; exports, 2,550 do Flour has been in sympathy with the active breadstuffs; market is well held at the advanced prices.

No. 2. ₱ bbl. $3.30@3.90; State and Western superfine, $4.35@4.75 city mills extra, $5@6; Spring wheat do. $4.85@5.10, Spring XX and XXX, $5 25@6.10; patents, $6.50@8; Ohio round hoop shipping $5.10@5.40.; trade brands, $5.50@6.25; St. Louis extra, $5.15@5 50; do. double extra, $5.60@5 90; do. family, $6@6.50; Southern shipping, $5 30@5.85, do. XX and family $6@6.75. Rye, $5.50@6. Corn-meal, Brandywine, $5.30@5.35; Western, $3 90@3.15.

Fresh Fruits.—A few Russet apples are quoted at $1.75@2.50 per bbl. Strawberries are abundant and cheap; fine Maryland and Delaware, 9@12c.; other, including New York, 4@8c. Hot-house grapes, Black Hamburg, $2 per lb. Peanuts were active; Va. hand-picked, 4½@4¾c. per lb.; fancy, 4@4¼c; extra prime, 3¾@4c.; good to prime, 3¼@3½c.; shelled, 2¾@3¼c.; pecans; 7@10c.

Grain.—Wheat shows the largest business ever attained here in one week. Yesterday alone over 2,000,000 bushels sold for future delivery and 350,000 cash. The market became more or less feverish, but closed with prices fairly supported. Corn exhibits a good trade. Oats depend upon a speculative trade.

Wheat, Spring $1.17@1.22; red Winter No. 2 $1.26¼@1.27½; red Winter $1.24@1.28; white Western and State $1.23@1.25. Rye, $1.00@1 14. Corn, white Western mixed 55@59c.; do. No. 2 58@59c; do. yellow 58@60c; white Western 58@63c; do Southern 63@66c.; yellow do. 58@60c. Oats, white No. 1 58c.; white No. 2 56c.; white No 3 48¼@49c; mixed No. 1 46c; do. No. 2 45¾@46c; do No. 3 44@45c.

Receipts for week, wheat, bush., 1 514,185; corn, do 2,111,150; oats do 323,350; rye, do. 86,808; malt, do. 58,540; barley, do 28,375; rice pkgs. 632.

Exports for week, wheat, bush 774,583; corn, do. 1,705,255; oats, do. 1,633.

Hay and Straw.—Exports for week 1,300 bales Since Jan 1st, 31,050 do; same time last year 44,500. The market for hay is easier; buyers begin to object to paying high rates for such low qualities now pressed upon the market. Straw also lower.

Prime timothy hay $1.00@1.05 ₱ 100 lbs.; medium 85@90c, do. shipping 75@80c.do.; clover mixed 80@85c.; do. pure 75@80c.; prairie hay, 65@70c. Long rye straw $1.05@1.10 ₱ 100 lbs.; short do. 60@65c. do.; oat and wheat 45@50c. do.

Hops.—The market is quiet under an absence of export demand and no important call from brewers. The crop of American in London is put at 1,500 bales.

Crop 80 choice 21@22c good to prime 18@20c; fair to good 15@18c poor to fair 12½@15c; eastern 13@21c; 79's fair to prime 15@17c; 78 6c.

Exports for week, 1,441 bales.

Receipts for week, 679 bales.

Milk.—Supplies have exceeded the demand as the week has been mostly cool and adverse to consumption. The market has been unprofitable for commission milk and dealers have advised farmers to hold back shipments while the flow is so large in the early pasture season. The average price at platform for the week ending May 21 was 83c. per can of 42 quarts the range being $1.25 to 60c., opening and closing prices.

Maple Sugar.—No further shipments are urged; sellers anxious to close out what is here. Prime molds, 9@10c.; other, 7@8c.; sirup, 10@11 pounds to gallon, 75c.@$1 per gal., with can. Duxbury, Vt., has a tree which has yielded this season 1½ pounds of sugar to 16 quarts of sap.

Poultry and Game.—Prime turkeys are scarce. Chickens are easier but are doing well. Fowls are quite plenty and are marked down.

Turkeys, fresh, prime, 14@17c large toms, 12@13c; Phila, Spring chickens 35@55c; N J. 35@50c; Phila, Winter 30@35c; do. Full 18@22c; fowls Phila. d.p. 15@16c.; N. J. d.p. 14@15c.; do. scalded 13@14c. State and Western d.p. 13@14c; scalded 13c; poor 11@12c. Ducks, Spring, 30@40c.; old 16@22c.; Squabs, white, $3 ₱ doz.; do. dark, $1.50@1.75.

Cooped stock is abundant, but the market is not steady, as a good many small lots arrive, which distracts quotations. Many chickens are arriving too small to suit any trade, hence the wide range.

Chickens ₱ pair 25c@$1, Fowls, ₱ lb. 13@14c; roosters, 6@7c.; turkeys 10@12c; ducks, 60@90c; geese, 75c.@$1.50; pigeons, 30@50c.

A New York State pigeon-shooting tournament is set down for June 20 at Coney Island. It is expected that 20,000 birds will be required; about 12 000 are on the way eastward and will stop at St. Louis for a few days' rest. A contractor for the match is engaged in the Indian Territory with Government permits to trap and fill up the required number.

Provisions.—The bulk of all supplies is in few hands and the market has ruled strong all the week and at times has been almost optional with the sellers.

Pork extra prime $13 50@14; Western mess new $16,50@16.75; old $15 50@16.75. Lard.—Western steam $11@11.05 per 100 lbs.; prime city $10.75@10.90; Hams smoked city 10@11¼c. pickled Western 10@10½c; shoulders, smoked city 8¼@8½c; picked 7¼@7¾c; rib, pickled 8¾@9¾c. Bacon long clear Western 8¾c. Beef plain mess $9 50@10.50. extra mess, $11@11.50; family $12@13; India $22@24; beef hams $20@23.

Receipts for week, beef, bbls. and tcs, 1,415 pork, bbls. 775; cut-meats, pkgs. 17,100; lard: do. 11,780.

Exports for week, beef, bbls. and tcs., 1,024; pork do. 1,758; cut-meats, lbs. 3,641,053; lard, do. 3,737,300.

Tobacco.—A fair business is reported for hhds. and cases.

Wrappers	10 @15

Vegetables.—Potatoes are 25c. firmer for choice double heads, but the market has no real strength.

Bermuda potatoes now $8 ₱ bbl.; Chin and Sav. new prime $6@7; seconds and culls $3@4; Florida $3@7; Early Rose, Nova Scotia do. $2 50@2.75; Maine do. $2.50@2.75 State, do, $1,87@2; do. bulk, $1.75@1.87; State inferior $1.50@1.62; Prolific eastern, per d. n. $2.12@2.25; Mercer, eastern bulk $1.75@2 Jackson do. $2@2.25; Chill Red, N. S. bulk, ₱ bbl, $2@2.25; Burbank, do. $2 12@2 25; do. bulk $2@2.25; Snowflake, per d.-h. $2.12@2.37; bulk, $2@2 25; peachblow per d.-h. $2.25@2 50 Peerless do. $1.75@2; do. bulk, $1.75@2.

Green stuff shows more animation with seasonable weather for use: asparagus low and plenty.

Green peas, Md. per bbl $5@5.50; Balt. $3@3.50; Norfolk per ½ bbl. $1.50@1.75; Chas. and Sav. string beans $3@2.50 ₱ crate; cucumbers, Fla. $1@2 50; do. tomatoes, per bu. box, $2@3; Bermuda ₱ 5-qt. box 50@60c.; squash Fla. per bu crate 50c@$1; cabbages, Norfolk $1.50@1 75; Ch'n & Sav. $3@3; Fla. new $1.50@3; beets, L. I. 100 bchs. $5@7; Norf. $4.50@5; onions, Bermuda $1@1.12 ₱ crate; lettuce, $1@1.25 ₱ bbl.; asparagus, Oyster Bay, $1.50@1.75 N. J. $1.25@1.50; radishes, L. I. per 100 bchs $1; round, 50@75c; rhubarb L. I and J'y do. $1@1.25; hot-house mushrooms $1 ₱ lb; carrots, $2@3 ₱ 100 bunches.

Wool.—The market is quiet and without new price features. California and Texas quotations show a decline. Southern unwashed arrives in small lots and is irregular in price.

Ohio, Penn. and W. Va. XXX and picklock, 43@44c.; X to XX, 38@41c.; No. 2 to No. 1, 38@41c. coarse, 33@36c. combing 39@45.

State and Western X and XX, 36@38c.; No. 2 to No. 1 36@43c.; coarse 30@35c.; combing, 38@44c.; combing unwashed 26@30c.

Va., W. Va. and Md. unwashed medium 26@29c.; Ga. and Lake unwashed medium 26@28c.; coarse 22@24c burry and slightly burry 14@19c; Cal. Spring choice free 28@29c.; fair to good 22@26c.; low grade and burry 18@21c.; Fall choice 22@24c. low grade and burry 15@20c. Texas choice free 25@28c.; fair to good 22@24c.; low grade and burry 15@20c. Pulled super 38@42c, extra 35@38c; No. 1, 20@23c: combing 38@43c. lambs 39@42c. Tub washed, fair to choice 35@42c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, May 28, 1881.

Beeves.—Receipts for the week 12,355 head: do. last week, 12,720 do. Cattle have sold steadily and the result was a better market than was at one time expected. Medium-class cattle have held up well in price. The closing sales were as follows: Native distillery fed, 9@11½c.; still fed bulls, 5@5¼c.; light Cherokee, 9c.; Colorado stock mixed, 10¼c.; native corn-fed steers ranged 10c. to dress 56 lbs. to 12¾c. to dress 57 lbs.

Cows and Calves.—Supplies continue moderate and the market is firm for good animals. There is a good strong range of $35@55 per head, with $60 firmly asked for a cow of really fine points and good present yield. Heavy supplies are not urged; when received are liberal a good many common head are apt to appear, and the market is injured thereby from top to bottom.

Veal Calves—Have had a good sale during the week and the market closes firm at the prices:—Prime N. J. fed, 6¼@7c.; do. State, 6@6¼c.; poor to good yard lots, 4¾@6c.; Mt. Hollys, 6@7c.; buttermilks, 4@4¾c; up-river dressed, 7@9¾c Our quotations include West Washington Market stock.

Sheep and Lambs.—Receipts for the week 29,130 head; do. last week 28,559. Sheep have ruled dull and a large portion of the offering was left over. The small sales of sheep were at 4@5¾c. with a few extra at 6c. Some very common Va. sold at 3½c. Some lambs quoted 7@8c.; a few State at 9c. and N. J. 9½@10c.

Swine.—Receipts for the week 27,583 head. do. last week 25,290 do. Market steady for Western corn fed at 6@6¼c; soft hogs rejected. City dressed State 8@8¾c. heavy to light; do. Western 7¾c.

We learn that Higgin's Eureka Salt received first premium at the Australian Exposition, which is another added to the many triumphs of the Higgins improved process for salt manufacture.—American Dairyman.

We import and buy direct from manufacturers all the goods we handle, and own them at the *lowest possible price* cash will purchase. During the past four years we have sent from our store over 12,000 of these orders, and they have gone into almost every State in the Union.

We keep in stock *every variety* of Tea known, and at all prices.

Oolong, Japan, Mixed, English Breakfast, Old and Young Hyson, Imperial, 50c., 75c., very finest $1. Gunpowder, Black Japan, Foochow 75c., $1. Orange Pekoe and Assam, 85c and $1.

Below are a *few* of the many Premiums offered:

With a $5 order we send a *Silver-Plated Caster.*

With a $10 order we send an *English China Tea Set of 45 pieces.*

With a $15 order we send a *Silver-Plated Caster, Pickle Dish and Butter Dish* or an *English China Decorated Tea Set of 44 pieces.*

With a $20 order we send a *French China Gold Band Tea Set of 44 pieces,* or an *English China Dinner Set of 106 pieces.*

We have *hundreds* of letters like the following:

LIME ROCK, Conn., April 30th, 1881.

Gentlemen—Please accept thanks for the beautiful Tea Set, which is much nicer than I expected, and indeed it is surprising to every one how you can do so much for so little. All are so well satisfied with the Tea that I think you will receive another order soon.

Yours truly, MRS. A. THORPE.

TAUNTON, Mass., March 8, 1881.

Gentlemen—I have forwarded eight different orders for Tea, and have received as premiums a tea set, a silver-plated caster, a dinner set, a glass set, a case of silver-plated knives and forks, a pair of French china fruit dishes, and *two ladies' gold watches*, and am now on my ninth order. Both Tea and premiums I am well pleased with, and have found perfect satisfaction with both. Yours truly,

MRS. MARIA C. LYNCH.

Orders, with P. O. Order, or money enclosed in registered letter can be sent at our risk. All checks or Post Office orders should be made payable to F. M. LINNELL.

We also send Teas by mail, Without premium, postage paid, at list prices, to those who wish for choice goods and are so situated they cannot obtain them at home. For full price and premium list, send us postal, with address PLAINLY WRITTEN.

GREAT LONDON TEA CO.

JONES OF BINGHAMTON,
Binghamton, N. Y.

THE JOHNSTON HARVESTER COMPANY,
Brockport, N. Y.

MANUFACTURERS OF

REAPERS, MOWERS, COMBINED MACHINES

AND

Self-Binding Harvesters.

The Johnston Harvester Co.'s

GLEANER AND BINDER

Will bind after any Reaper. Simple in Construction, and easily operated Binds with twine. The gathering apparatus is quickly and easily adjusted

And adapted to all the varying conditions of Crop and Ground.

The great utility of this Machine can easily be seen. See RURAL NEW-YORKER of Jan. 22.

Reading for the Young.

DAISY'S YEAR IN SOUTHERN CALIFORNIA.

ALICE P. ADAMS.

An Easter Letter.

SAN GABRIEL, April 18, 1881.

DEAR MOTHER:—This is the month of roses! I thought when I first came that they could not be more beautiful, but now they are much finer, and in addition to the ever blooming varieties all the June roses are out. Mrs. Erman has a yellow rose like the one in the front yard that always blooms so early. It seemed like a little bit of home when the first bud opened, for most of the roses are so different from ours.

A great many of the vines and climbers about the veranda have grown above the roof and are fastened to a stout wire extended on posts. This came down a few days ago and last Saturday Mr. Erman brought a ladder and went on the roof to fix it. Violet and I went up with him. Violet had been there several times, so she did not mind. But I never remember of having climbed a ladder before, and this one seemed so shaky that I almost screamed out several times before Mr. Erman landed me safely on the roof.

Such a lovely view as we had of the mountains and valley. I sat down and enjoyed it until Mr. Erman called for some assistance.

Oh, mother, I wish you could have seen the roses that lay heaped upon the roof (*In luxuriant profusion* may be more elegant, but *heaped* expresses the idea precisely.) There were roses of all sizes and colors but the most beautiful were the Lamarque and Gold of Ophir. These grew together on the north side of the house, one being budded into the other and they had made such rank, vigorous growth that the combined weight of the boughs and branches had broken down the wire. The Lamarque is trained to the top of the house and is covered with clusters of white buds and blossoms. But the Gold of Ophir, now in full glory, is so different from the roses you have known that you cannot comprehend its loveliness until you see it with your own eyes. Its color is pink and yellow so beautifully shaded together that you cannot tell where one ends and the other begins. Violet says that a gushing lady-reporter once described it as "peaches and cream in the form of a rose." There are hundreds, I might almost say thousands, of blossoms on it. Mr. Erman is going to have it photographed for the benefit of his Eastern friends; especially those who sympathize with the family for living in the backwoods so far from civilization."

We picked quantities of the roses, for it seemed a pity to let such beauties "waste their sweetness on the desert air." I filled every vase in the house, and Mrs. Erman sent a great many to the decorating committee at the church.

I scratched my hands dreadfully, but had a delightful time, and my happiness would have been "without alloy" if I had not been tormented all the time as to the manner of my descent; for that old ladder did not reach to the roof, and how I was to get down without breaking my neck I could not understand.

Violet went down first without any trouble. Then came my turn, and I approached the edge of the roof in fear and trembling.

"Now, Mr. Erman," I said, "if you let me fall my mother will have you hung for willful murder!"

I was sorry that I said it, for it made him laugh so hard that I really was afraid he would let me drop into the geraniums below. "With such a doom hanging over me I must be especially careful," he replied. "But there is no need for any fear. Violet, tell Daisy when her foot is near the first round." So I was lowered till my foot struck the ladder, and then crept slowly down.

Yesterday morning Bert, Violet and I went down to the Easter service at the old Mission Church. It was the first time I had been inside, though we have frequently driven by it on our way through the Mission. The church is just one hundred and ten years old. It is of a queer shape, long, narrow, and there are plants growing on the roof and the projections at the sides—growing in the dust of ages. There is a strange old bell-tower, which once had a chime of six bells that were brought from Spain; but there are only four left.

The streets of the Mission were thronged with Mexicans, dressed in their best, and the church was well filled; but Bert managed to secure seats for us. We were quite early, and I looked around with considerable curiosity, as I never had been in a Catholic church before. Formerly it had only a dirt floor, so Violet informed me, but now it has an ordinary floor with a sort of asphaltum pavement through the center. On either side there are six seats, or pews, having little doors; back of these are a few benches without backs (on one of which we were seated), and then a long, empty space where the people knelt or stood. The walls are roughly plastered, and are adorned with large oil pictures of the apostles, and smaller paintings having crosses on their frames. At the top it is open to the roof, showing the rafters.

In front, back of the altar, was a large figure of the Virgin, and two other images. I do not know what they were intended to represent. Then there were lighted candles—four very long ones, and a good many that were shorter—Bert said there were thirty-five in all. There were also a number of bouquets of natural and artificial flowers, but aside from this the church was not decorated.

I expected to find no one but Mexicans attending the services, but I saw a good many white people—some of them very well dressed. They were seated promiscously throughout the building. One old Mexican woman, before she took her seat, kneeled slowly down on the pavement, and touched it with her forehead. When the women came in late, if there were no vacant seats down they knelt on the floor. A good looking woman, wearing a nice black silk, knelt by us till a Mexican gave her his seat. The church was very damp and cold, and I do not see how those women and children endured staying on the floor so long. The men were not as humble; they seemed to prefer standing.

After awhile the priest came in with some boys dressed in red and white; and as soon as they appeared four Mexican women in a rude gallery at the back of the church began to sing. Of course we could not understand anything, but it was the queerest music I ever heard, for they all sang through their noses and *very* slowly. Bert said it strongly reminded him of a cat concert. I remember this strain came in very often.

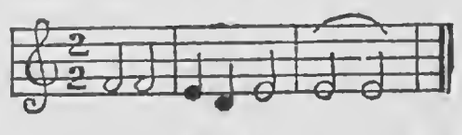

FIG. 289.

Ask Mary to sing these notes with a decided nasal *twang* and as slowly as possible, and you may get some idea of the *music* to which we listened. While the *choir* was singing, the priest came down the aisle with one of the boys and scattered something around—I suppose it was incense. Then he went back to the altar and commenced a sort of chant. First he sang and then the choir responded. When this was finished he went up into a queer little pulpit built out at the side of the church, and read from a book in Spanish, and then commenced to preach in the same language.

After he finished his sermon he read in English a long communication from the Bishop with reference to certain collections, and then made lengthy explanations for the benefit of the American part of his congregation. Then he took up the paper again and commenced reading it in Spanish. "Oh, fudge!" said Bert. "Do you girls want to stay and hear all that rigmarole over again?"

Neither of us cared to stay any longer, (for it was very tiresome sitting on that bench without any back,) so we walked out into the pleasant sunshine which seemed all the brighter on coming out of the gloomy, damp old church.

In the afternoon there were Easter services at the little Alhambra chapel. I cannot help thinking of the way our church at home is usually decorated for Easter. If the weather is mild a few living near take over some of their house-plants, and possibly borrow some from the green-houses, and everyone says, "How beautiful!"

I wish all the people in E—— could have seen this little church yesterday. I am certain that very few of them ever looked upon such a sight.

The windows and illuminated texts on the walls were festooned with long sprays of English Ivy. Back of the minister was a cross of callas over five feet high—(this refers to the cross, for callas five feet in hight would be a wonder even in California) and rising from a mound of roses of all colors. The altar rail was completely hidden in flowers, and in front of it was a perfect bed of the beauties—roses and many other kinds. There must have been *bushels* and *bushels* of flowers there. On the wall was a lovely anchor of Gold of Ophir roses, and there were bouquets in every available place: one vase of delicate wild flowers and ferns was especially beautiful.

There! Violet is calling me to go down in the *arroys* with her. You cannot complain that this letter is short, so write a good long one in reply to

Your loving daughter. DAISY HEBERDEN.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—My father has long taken the RURAL NEW-YORKER, until lately, when he let me take it. I am a Northern New York girl and live on a farm near the Rackett river. I am 14 years old, and have taken the first premium twice at the fair for yarn spun by a girl under 15, and have once more to try. I have just finished a quilt for our next fair which has nine hundred and seventy-eight different kinds of print in it. I am very fond of flowers and pets. The farmers around here have been busy this Spring making maple sugar. CARRIE M. CRANDALL.

Hanawa Falls, N. Y.

THE YOUNG QUERIST.

A. W., Peterboro, Canada, asks if we allow Canada boys and girls to join our Club.

ANS.—Certainly. We hope to enroll on our list many names from Canada. If you have applied for admission before, your letter has been miscarried, as we have not received it.

O. M., Cool Springs, Ga, sends flower for name.

ANS.—We are not able to name the flower you sent us. If you will send us a better specimen with stem, leaves and flowers, we will name it for you.

D. R., Solitude, Ark, wishes to know if violets make seed.

ANS.—Yes: you can obtain seed at almost any seed store.

W. P. D., Dover, N. Y., asks, 1, the name of the little black bug found on squash vines; 2, what will destroy it.

ANS.—1. This little bug is known as Coreus tristis or common Black Squash Bug. 2. The best way to get rid of these pests is by hand-picking. Examine the vines daily during the early part of their growth, both for the bugs and their eggs. Place pieces of boards near the vines, for the bugs will collect under them at night, and early in the morning they may be killed.

Fair skin, rosy cheeks, buoyant spirits and the sweetest breath in Hop Bitters.—*Adv.*

Miscellaneous.

A RICH EXPERIENCE.

What a Prominent and Well-Known New York Physician Told a Reporter.

His Revelation Upon a Subject of Vital Interest to All.

(*Detroit Free Press*)

The experience of any one of education and learning extending over a long period of time must necessarily be valuable, and while no two experiences in this world are alike, there is such a similarity between them as to render one which is rich in valuable facts of benefit to all. America's greatest orator declared that he knew of no way of judging the future but by the past; and past personal experience is of the same nature as that history which repeats itself.

A representative of this paper while lounging in the lobby of a prominent New York hotel, met a gentleman whom he had known years before in the city of Detroit, but whom he had not seen before for a number of years. When the knight of the quill had last seen this gentleman, he was giving his entire time and attention to an extensive medical practice, and was on the crest of the wave of popularity. From Detroit he removed to New York where he could find a more extensive field for his talents and experience. Although several years had passed, the doctor's physical condition had evidently very much improved, for he was looking much better than when the man of news had last seen him. After some general talk, the doctor fell into an easy train of conversation and uttered some truths so scientific and valuable, as to justify their reproduction in print.

"Yes," said the doctor, "I have improved in health since you last saw me and I hope also in many other ways. One thing however, I have succeeded in doing, and it is one of the hardest things for anyone, and especially a doctor, to do and that is I have overcome my prejudices. You know there are some people who prefer to remain in the wrong rather than acknowledge the manifest right. Such prejudice leads to bigotry of the worst order, and of precisely the same nature as characterized the sixteenth century when people were burned at the stake. Now I am a physician and of the 'old school" order, too; but I have after years of experience and observation, come to the conclusion that truth is the highest of all things, and that if prejudice or bigotry stand in the way of truth, so much the worse for them—they are certain to be crushed sooner or later. Why, when I knew you in Detroit, I would have no sooner thought of violating the code of ethics laid down by the profession, or of prescribing anything out of the regular order, than I would of amputating my hand. Now, however, I prescribe and advise those things which I believe to be adapted to cure, and which my experience has proven to be such."

"This is rather an unusual way for a physician to talk, is it not, doctor?"

"Certainly it is. It is way outside of our code of ethics but I have grown far beyond the code. I have all I can attend to, and am determined to be honest with my patients and mankind, whether my brother physicians are with me or not. Why, I prescribe medicines every day, some of them so-called patent medicines, which would render me liable to expulsion from the medical fraternity, but I am supremely indifferent to their laws."

"Are the medical fraternity of the country combined against proprietary medicines, doctor?"

"Invariably, and it is sufficient ground for expulsion from any medical society in the land to prescribe any patent medicine whatever, no matter if it is made from an exact formula, such as physicians are using every day. You see the code is established and sustained by old physicians like myself, who make the rules and insist upon their enforcement in order to keep the younger doctors from obtaining a foothold and encroaching upon the already established practice of the older ones. This is largely the reason why young physicians have such a hard time of it; they are fettered by the code, and have only their personal influence to depend upon in securing practice."

"How did you come to get such heretical ideas as those, doctor?"

"Oh, they are the result of my experience and observation. I obtained my first ideas upon the subject, however, from having been cured after all my care and the skill of my professional brethern had failed to relieve me. Why, I was so badly off with a complication of troubles, including dyspepsia, and consequently imperfect kidneys and liver, that I feared I should have to give up my practice. For more than a month I could not sit down or get up without the most intense agony, and I was suffering all the while. Some one advised me to go out of the regular channels and try a remedy that was becoming quite famous for the remarkable cures it was effecting; but my prejudice was altogether too strong for that. However, I did quietly begin trying the remedy, but I promise you I said nothing to my brother physicians, or even to my family about it. Well, sir, it was a revelation to me: for in all my medical experience I never saw anything operate so rapidly or so effectually as that did. I owe my health to-day; and for all I know, my life also—to the remedy know as Warner's Safe Kidney and Liver Cure. That was the starting point with me, and my prejudices faded very rapidly after that I can assure you. I went to reading extensively and analyzing more extensively, and I suppose I analyzed all the leading proprietary medicines that are made. Many of them I found perfectly useless, being compounded simply of water with a little flavoring. A vast majority of them all, however, I found made up of prescriptions used by physicians in their every day practice; but out of the entire number I found only two that contained absolutely harmful ingredients and then in very slight quantities. Indeed we are prescribing things constantly that have more deleterious matter in than they had. After discovering this, I said to myself: why should the medical fraternity be prejudiced against those prescriptions which they are writing every day, simply because they are put up by wholesale and are sold with a government stamp on the wrapper. I saw its manifest absurdity and I resolved that I would be bound by it no longer. Since that time, I have prescribed proprietary remedies nearly every day, in my practice, and I have no reason to regret having done so. Why, only a few days ago, I advised a lady who was suffering from a serious female difficulty and displacement to use this same Safe Kidney and Liver Cure which cured me. I saw her this morning and she is nearly well; the pain and inflammation are all gone and she is around as usual. We have no right in the medical fraternity to sit back and declare there is no such thing as improvement or advancement or that we have a monopoly of the remedies which nature has given to mankind. There are great changes going on in every department of life and there are great developments in medicine as well. Thousands of people die every year from supposed typhoid fever, rheumatism or other complaints, when in reality it is from trichina, and the result of eating poorly cooked and diseased pork. A vast majority of all diseases arise from imperfect kidneys or liver. The liver becomes clogged, and its work is thrown upon the kidneys; they become overworked and break down, and so the poison gets into the blood instead of being thrown from the system. No one with perfect kidneys or liver is ever troubled with malaria; and it is the poisonous particles which these diseased organs allow to get into the blood that clog the capillaries of the lungs and cause tubercles and consumption. Thousands of children are dying every year from dropsy as the sequel to scarlatina, when in reality it is diseased kidneys which have become weakened by the fever they have just had. Here is another strange thing: not one in ten people who have diseased kidneys notice any pain in the vicinity of the kidneys, for these organs lose their nervous sensibilities when they become diseased, and the symptoms are shown in hundreds of other ways."

"Well, doctor, you have got some new truths here, certainly, but they sound very reasonable to me."

"Well, whether they are reasonable or not, I have demonstrated to my own satisfaction that they are true, and I propose to stand by them, no matter how much opposition I may raise by doing so. Any man, be he politician, preacher or physician, who is so considerate of his pocket-book or of his own personal ends as to stultify himself by suppressing the manifest truth, is unworthy the name of man, and unworthy the confidence of the public whom he serves."

TRADE KIDNEY-WORT MARK

THE ONLY MEDICINE

IN EITHER LIQUID OR DRY FORM

That Acts at the same time on

THE LIVER, THE BOWELS, AND THE KIDNEYS.

WHY ARE WE SICK?

Because we allow these great organs to become clogged or torpid, and poisonous humors are therefore forced into the blood that should be expelled naturally.

TRADE KIDNEY-WORT MARK

WILL SURELY CURE

KIDNEY DISEASES,

LIVER COMPLAINTS,

PILES, CONSTIPATION, URINARY DISEASES, FEMALE WEAKNESSES, AND NERVOUS DISORDERS,

by causing free action of these organs and restoring their power to throw off disease.

Why suffer Bilious pains and aches?
Why tormented with Piles, Constipation?
Why frightened over disordered Kidneys?
Why endure nervous or sick headaches?

Use KIDNEY-WORT *and rejoice in health.*

It is put up in **Dry Vegetable Form**, in tin cans one package of which makes six quarts of medicine. Also in **Liquid Form, very Concentrated**, for those that cannot readily prepare it.

☞ It acts with equal efficiency in either form.

The Literary Revolution.

To keep in good humor the good people who delight in good books; to wake up the slow booksellers who are inclined to go to sleep in the summer, instead of, like a 'possum, in the winter; and to prevent our friends, the **Cheap Books.** book publishers, from forgetting us, we have concluded to publish a few more cheap books. If we are to name him at all, we must, of course, head **Shakespeare** the list with the immortal Shakespeare, and will give you either his "Merchant of Venice" or "Hamlet," or any one of his fourteen other principal plays, in beautiful type, for 3 cents. At **Three Cents.** the same price you may have Macaulay's "Life of Frederick the Great," former price $1.25, or Carlyle's "Robert Burns," or Lamartine's "Life **Washington Irving.** of Mary Queen of Scots," or Thomas Hughes's "Manliness of Christ." Washington Irving's wonderful, delightful, heretofore inaccessible "Sketch Book," which contains the incomparable Rip Van Winkle, you can **A Dime.** have for a dime. For the same price **Tom Brown** we will give you "Tom Brown at Rugby," the best boy's book ever written, except "Robinson Crusoe," which you can have also **Crusoe.** for 10 cents. To charm those who delight in fiction, we give also for 10 cents each, Cooper's "Last of the **Cooper's Mohicans,"** one of the most justly celebrated American novels, and Charles Kingsley's "Hypatia," which worthily ranks at the very **Mohicans.** front of famous historical fiction. These are only specimens of the cheap books we publish, are all in good type, neatly printed, and are not in the broad side or any other "side" or "square" style, but handy pocket volumes, of course in paper binding. Our motto, however, has always been that a book worth reading is worth preserving, as well as worth owning, and our large list of standard books, to which we are making additions, with speed unprecedented in the history of publishing, are all elegantly and strongly bound, in cloth or better style, and sold at prices proportionately low with those in paper covers. We issue these few only in pamphlet form, as specimens of the quality of our good literature, and these special terms will not be long continued. **5,000 Booksellers** throughout the United States and Canada are prepared to either abundantly supply or literally slander our publications. We give liberal terms to clubs where no bookseller acts as agent. Descriptive Catalogue, and illustrated pamphlet describing book-making and type-setting by steam, will be sent free, on request. **AMERICAN BOOK EXCHANGE, 764 Broadway, New York.**
JOHN B. ALDEN, Manager.

Implements and Machinery.

BUCKEYE CULTIVATOR.

A NEW **Senior Buckeye RIDING CULTIVATOR,** For 1881.

A NEW **Junior Buckeye** Riding and Walking **CULTIVATOR,** For 1881,

Have many New and Important Advantages.

The most Complete Corn Cultivator in Use.

They have four or six Shovels for Corn, or five, six or seven for shovels Fallen, and they are the best Falls Cultivators in the market. They have the Patent Rotary Shield and Foot Treadles for raising the Shovels.

Humorous.

A CONNECTICUT man has invented a pipe that will light itself. This is an underhanded attempt to force house-painters to find some new way to kill time.—Boston Post.

A PERSON overheard two countrymen, who were observing a naturalist in a field collecting insects, say one to the other, "What's that fellow doing, John?" "Why, he's a naturalist." "What's that?" "Why, one who catches gnats, to be sure."

"I CANNOT sing the old songs," shrieked an amateur soprano the other night, and while she took in breath for the next line a young man who had looked in for a moment was heard to remark, casually, but emphatically, "You just bet you can't." It broke up the concert on the spot.

Mischief in the Air.

We cannot analyze the aerial poisons that produce epidemic and endemic diseases; but the valuable discoveries which have been made in vegetable pharmacy enable us to counteract their malific influence. The most powerful known antidote to every species of malaria is Hostetter's Stomach Bitters, a pure Botanical medicine, in which the finest anti-septics, tonics, alteratives and stimulants of the vegetable kingdom are skilfully and effectively combined. At seasons of the year when the atmosphere is surcharged with miasma, and whenever the specific virus of any infectious disease is supposed to be present in the air, this famous corrective should be taken regularly as a protective All who choose to observe this precaution may bid defiance to intermittent and remittent fevers, and in fact to all disorders generated by foul exhalations or impure water.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Vol. XL.—No. 1637.} NEW YORK, JUNE 11, 1881. {PRICE FIVE CENTS $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

HOLSTEIN COW, NETHERLAND QUEEN (414.)—From a Photograph.—See Page 382.—Fig. 290.

The Herdsman.

HOLSTEIN, OR DUTCH FRIESIAN CATTLE

PROFESSOR I. P. ROBERTS.

Holland, or more properly speaking, the kingdom of the Netherlands, the native country of these cattle, contains 13,000 square miles while New York contains 47,000 square miles. It is divided into 11 provinces and has a population of about 3,500,000. This country is the lowest in the world, the greater portion of it lying below the sea-level. The drainage of Haarlem Meer, a lake eighteen miles long, nine wide and fourteen feet deep, begun in 1840 and completed in 1853 at a cost of eight million florins, was one of the greatest feats of modern engineering skill. The reclaimed land sold for an average price of 1,434 florins per acre, and this Polder has at the present time a population of 7,249. There were many smaller lakes and numerous marshes, which have been reclaimed and are now known as Polders. The land is extremely fertile but quite moist, and is therefore not adapted to grain-raising, but is admirably fitted for producing grasses.

Immense and costly dykes prevent the encroachments of the sea, and a multitude of gigantic wind-mills pump the water from the lower levels to the higher, whence it finds its way through the large canals to the sea. Usually no fences are required, as large ditches define the boundaries of fields and farms. These being nearly full of water and very soft in the bottom, restrain the cattle most effectually. It is estimated—how accurately I cannot tell—that the land of the Netherlands has cost two and a half times as much to reclaim it as it would sell for in the market to-day.

With scarcely an exception, all the cattle of this breed imported into the United States have come from the two provinces of North Holland and Friesland; the lower lands furnishing by far the best specimens. The breed has been formed by surroundings and circumstances rather than by a few scientific breeders, like Colling, Bates and Booth. They are without doubt the most ancient of all modern breeds, since history gives no intimation of any other breed or sub-breed occupying the Low Countries prior to these variegated black-and-white Dutch cattle. In the last hundred years they have been improved in form and milking qualities, not by any admixture of blood, but by more careful selection and better care, food and stables. Within the last twenty years the best breeders have been breeding towards more uniform colors. The prevailing fancy in the United States just now is black and white not mixed, but with margins distinctly defined and the former color predominating. The dark color, when a jet black, adds somewhat to their beauty; but some claim that animals thus marked are not such good handlers as are those of a brownish-black tinge. Various circumstances combine to enable the Hollander to keep an immense number of cattle: his land is very productive and is all devoted to grass; the grass is fed to the cows and young cattle along with some purchased concentrated food. In fact, the number of animals in some districts is so great as to be almost beyond belief.

These cattle, without written pedigrees, without a single eminent scientific breeder, and in juxtaposition to other breeds, have not only preserved through long years their purity of blood, but have steadily improved in valuable qualities. This is owing to the fact of

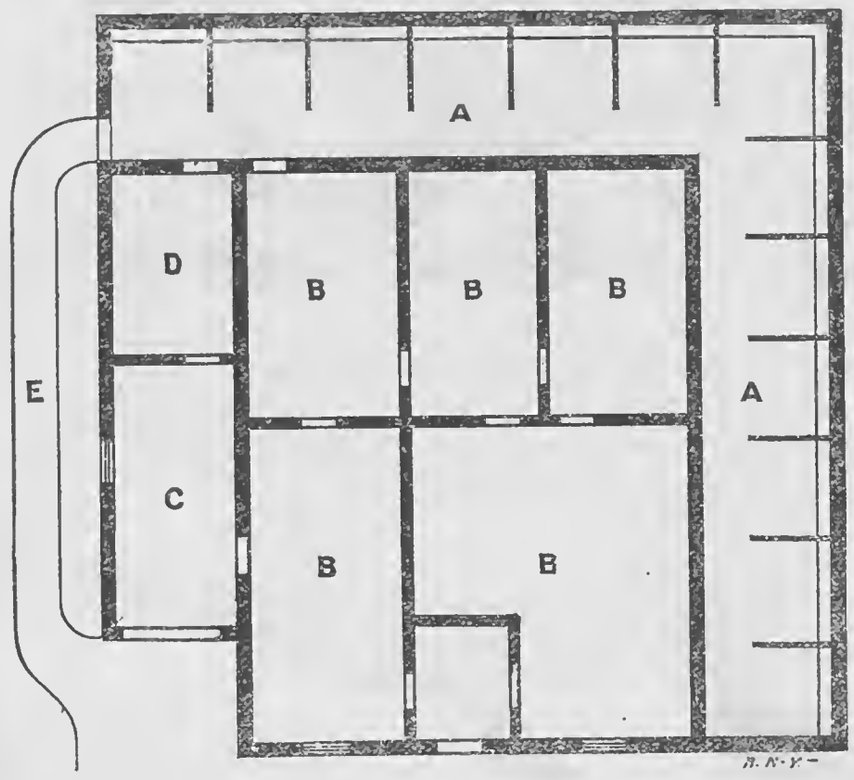
their development under peculiar circumstances. The climate is cold, raw and damp in Winter, necessitating the best of shelter and care; the grasses are abundant, nutritious and succulent; the soil moist and level. These circumstances aided in producing a large, thick and long-haired animal. In an early day, dairying naturally attracted great attention, as in those times the products of the cow could be transported more cheaply and more easily than her carcass. Therefore, selections were made by all with reference to milking qualities, while without special care or attention by the breeders the abundant and nutritious food gave size. As breeds were formed in adjacent countries, a few from time to time, of various strains, were brought into Holland and either bred separately or crossed with the native cattle. The result was always an animal inferior to the pure home-bred beast, consequently the foreign blood was discarded. Briefly stated, these are the causes that have led to the formation of this *par excellence* milk and beef breed combined, and have preserved it in its purity.

To get a better idea of the Hollander's methods, let us take for illustration a dairy of thirty first-class cows. They would produce thirty calves. The males, with possibly a single exception, are vealed and sold. From six to ten of the most promising calves are raised, their selection being largely governed by the milking qualities of their dams. This is done every year, and therefore each Spring there is a like number of two-year-olds to have their first calves. These heifers are bred to come in early in order that extra food and attention may be given them to develop their milking qualities to the highest extent. But this does not satisfy the close-figuring Dutchman. For while all, with scarcely an exception, will be good milkers, some will be better than others and thus the third time a careful selection is made. If mistakes have been made before, they can be corrected; for the cows are now put to that most perfect and rigorous of all tests—actual performance at the pail. Nothing but superior performance will do in that land of high rents, and it is not uncommon for one-quarter of these heifers to find their way to the butcher before Christmas. As these young animals are each year added to the dairy some of the older ones must be sold to make room for them; so, if at three years or at any subsequent age they do not maintain this high standard, they are sent to the block. Let them be ever so good, they seldom see their eighth year, as it would be bad policy to keep even a very good cow till she was a worn-out shell, not profitable for beef, when there are plenty of younger animals coming on equally good to fill her place. If fattened at a comparatively young age she will sell for $80 to $100.

The Holstein in the hands of the Dutchman never dies in debt. The veal, the two-year-old, whether she be superior or only a fair milker, or the more mature cow, always shows a balance on the credit side. It will be seen that the method practiced tends to maintain, not only the milking qualities, but to improve them. It will also be noticed that the sales are: first, veals; then butter and cheese, and, in the Fall, beef. The sales of meat frequently reach $800 a year in a dairy of 30 cows, veal and cow-beef bringing nearly twice as much with them as with us. The Lord might have made a better breed of dairy cows than the Holstein, and a more economical and close-figuring dairyman than the Hollander, but He never did.

The management of the cattle and the manner in which the Hollander lives are so closely connected that, to some extent, both must be described at the same time. Figure 291 represents the dwelling-house and the cow-stable, which are under the same roof. They are included in one large building from 60 to 80 feet square, divided into first floor and loft. The first story is built of small, hard-burned brick, and is scarcely raised above the level of the ground. The roof is very steep and high, without gables, and hipped up on all sides to the peak. The upper portion of the roof is thatched with straw or reedy grasses; the lower edge is often covered with earthen tiles, painted some bright color, and the thatching is cut in handsome scallops where it meets the upper edge of the tiles. The roof forms an immense dome, 40 to 60 feet high, in which hay—the only field product—is stored. The cut shows how one corner of the building is cut out in order to get an entrance of sufficient hight for the loads of hay, which are drawn with one horse hitched to a wagon having neither shafts nor tongue. The hay is supported by large, planed beams or joists, covered on their upper side with flooring. The under side of the floor and the beams which appear in the room below are thoroughly painted and varnished.

Figure 292 represents the ground-plan of house and stable. It will be seen that the cow stable consists of a row of stalls along two sides of the building. The cows are tied up in these stalls in the Fall and remain there until turned out to pasture in the Spring. They are usually arranged in pairs on the elevated platforms of the stalls, and there is a round window for each pair. Depending from the ceiling are cords to tie up their tails that they may not become soiled. The droppings are removed several times daily. The feed consists of hay with a very small amount of concentrated food, such as oil-cake, and the excrement is therefore not so offensive as that of more highly-fed animals. The stables are all perfectly sweet and clean; in fact, they are—



GROUND PLAN.—FIG. 291

without the least exaggeration—cleaner than many American kitchens.

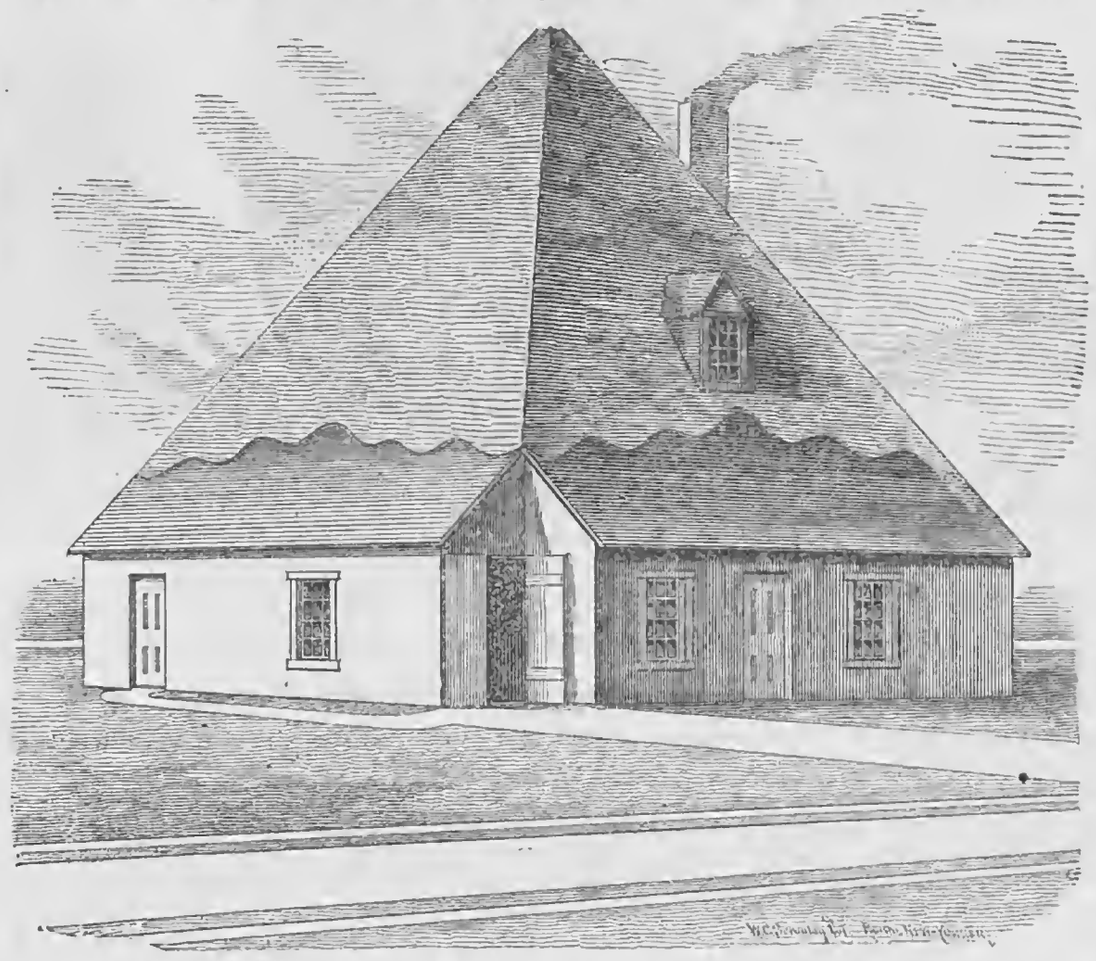
The Winter living-rooms of the family comprise the rest of the house on the first floor. After the cattle are turned out in the Spring the stalls are thoroughly cleaned, painted and varnished throughout; the walls of the stables are ornamented with pictures, family china, household utensils, etc., and frequently a portion of them is used for a Summer dining-room and kitchen. There are two doors beside the large one for the loads of hay, the cow-stable door and the front door. The last is furnished with an inside bolt only, and is sometimes called the "dead door," as it is never used except in case of a marriage or death in the family. All visitors, of whatever station, are expected to enter through the cow-stable door. Members of the family remove their shoes (sabots) outside the door and step into slippers which are always kept just inside. These people by kindness and attention and by anticipating every want of their cattle, have succeeded in breeding into them an unusually quiet and peaceable disposition which they transmit to their off-spring. I trust that the nervous American will not breed, frighten or starve this valuable quality out of them. These Holstein cattle so admirably adapted to the northern part of the Netherlands, are an extremely valuble addition to our other breeds, and there is room enough in our great country for them. But we must approximate to the same circumstances and surroundings which have produced them, or they will degenerate. He who places them on poor, hill pastures, starves them in August, lets them run dry three months in the year and both starves and freezes them in Winter, will become disgusted and conclude that acclimated natives are the best after all. So they are for such dairymen. Liberal food, kind and intelligent treatment will find their greatest reward when bestowed upon the somewhat artificial or improved breeds.

Holstein Cow, Netherland Queen (414).

Netherland Queen, Fig. 295 owned by Messrs. Smiths & Powell, Syracuse, N. Y., was selected in Holland by one of the firm, when coming one year old, as the finest representative of the breed to be found in that country. As a one-year-old she was awarded the first prize at the N. Y. State fair at Elmira in 1878. As a two-year-old she won the first prize at Utica, N. Y. As a three-year-old she was placed in the class of mature cows, and in a very superior class of older animals was awarded second prize at Albany. She dropped her first calf when just about two years old, and during the year made an unequaled two-year-old milk record of 58 pounds 12 ounces in one day, 1,670 pounds 9 ounces in one month, 18 574 pounds 3 ounces in a year, dropping her second calf two days less than a year from the date of the first. She is from the same herd in Holland and closely related to the heifer "Lady of the Lake" whose cut appeared in the RURAL some weeks since, and which has recently closed her two-year-old record of 12,200 pounds 4 ounces in a year, commencing her record at 22 months old. The milk record of 22 registered Holstein cows of the herd of the above firm for the year just closed, averaged, for mature cows, 14,164 pounds, 15 ounces; and for two-year-old heifers, 9,681 pounds 15 ounces.

HEREFORD CATTLE.

THESE cattle obtain their name from the county of Hereford, England, where, from the time "to which the memory of man runneth not back," they have been always extensively,



ELEVATION OF FRIESIAN FARM HOUSE AND STABLE COMBINED.—FIG. 292.

and sometimes almost exclusively, raised. Their origin, like that of all the other ancient breeds, is "wrapt in mystery;" but it is supposed by those who have made a special study of the matter that they trace back, in part, at least, to a race of white cattle with red ears described in the tenth century. Down to the present day pure Herefords of this color crop out, probably through atavism. It is related that Lord Scudmore, who died in 1671, introduced cows of a red-and-white breed from Flanders, and these are supposed to have been bred with the white race with red ears, and to have produced the colors of the Herefords of to-day. In any event, they are certainly a very ancient breed, and are generally thought to be allied to the Devons.

As long ago as 1766, Mr. Benjamin Tompkins began to breed Herefords carefully at Kings-Pyon, nine miles from the city of Hereford, and continued the business for about 50 years. He was to the improved Hereford what the Collings brothers were to the improved Short-horn. After his death his herd of 52 head, including calves, was sold at auction, in 1819, and brought an average of $450 each, a two-year-old bull making $2,940, one cow $1,365, and several others over $1 000. These prices show the high estimation in which this breed was then held. Even before that date, however, a Hereford ox bore away the first prize at the first meeting of the Smithfield Club, in 1799. This was a seven-year-old beast, eight feet eleven inches long, six feet seven inches high and ten feet four inches in girth—a goodly animal with which to begin the Hereford record, and worth its price—100 guineas—$525. The first known importations of Herefords into this country consisted of two cows, or heifers, and one bull, which arrived in Baltimore in May, 1817, for Henry Clay, of Kentucky. For some years there was in that State a close rivalry between Short-horns, Long-horns and Herefords; but finally, after 1830, the two latter were bred to Short-horn bulls and both the other pure breeds soon became extinct there. The next importation of any importance was made into this State by Messrs. W. H. Sotham and Erastus Corning, in 1840. During the seven years these gentlemen continued together in the business of breeding Herefords they sold a considerable number of cattle in New England and this State. In 1860 and 1861 two importations were made into Canada, consisting of two bulls and eleven cows and heifers. Since then numerous importations have been made chiefly to Maryland, Maine, Indiana, and Illinois. Lately the first volume of the American Hereford Record has been published, containing the pedigrees of 2 915 pure-bred Herefords in this country, and we understand about 1 000 other entries have already been contributed towards a second volume.

The old Herefords, according to Youatt, were brown or red-brown, with not a spot of white about them, but those of to-day are red with white faces, white on the top of the neck, along the throat, dewlap, brisket and fore-legs, belly and flanks; and white hind feet and tail tips are also now fashionable. The head is small in comparison with the rest of the body; the chest deep and full; the bosom sufficiently prominent; the shoulder blades thin, flat and sloping towards the chines, and well covered on the outside with mellow flesh; the chine and loin broad; hips long and moderately broad; legs straight and small; rump forming a straight line with the back; thighs full of flesh to the hocks; hide thick, yellow, and well covered with soft, glossy hair, having a tendency to curl. The horns belong to the "middle-horn" class. Their chief merits are a robust constitution, early maturity, great aptitude to fatten, freedom from disease, hardiness which enables them to withstand climatic extremes better than any other breed; ability to thrive on rough fare; great prolificness; excellent calving propensities, enabling them to drop their calves, even when in high condition, with little trouble or danger. They are also considered to be the best graziers in England, and, taken from grass, their flesh fetches the highest price in the London markets, except the small supply from the West Highlanders. The beef both of the male and female Hereford is highly prized for its excellent flavor and its beautiful marbled appearance due to its admixture of fat and lean.

It is claimed that Herefords will fatten on less food than Short-horns and mature as early; that their flesh is better and they are hardier and more active. They are purely a "beef" breed, as the cows give less milk than those of any other strain. This is due to the fact that for generations they have been required only to rear their own calves; hence their milking properties have been neglected, aptitude to fatten having been cultivated instead. The Hereford working ox is possessed of greater strength than the Devon, is quick, gentle and an excellent traveler. The hardiness and capability of taking care of themselves on rough and scanty pastures, together with their aptitude to fatten at an early age, and the excellent quality of their flesh, are fast making the Herefords favorites in New Zealand, Australia, Canada and our Western States and Territories. The recent establishment of our meat trade with Europe has greatly increased their popularity on the plains, where already the demand for bulls can hardly be supplied for the purpose of improving, by crossing, the quantity and quality of beef from "natives" and Texans. Wherever they have been introduced they have become readily acclimated and adapted themselves to new conditions, retaining all the while their character, form and quality.

NORFOLK AND SUFFOLK RED POLLED CATTLE.

G. F. FABER.

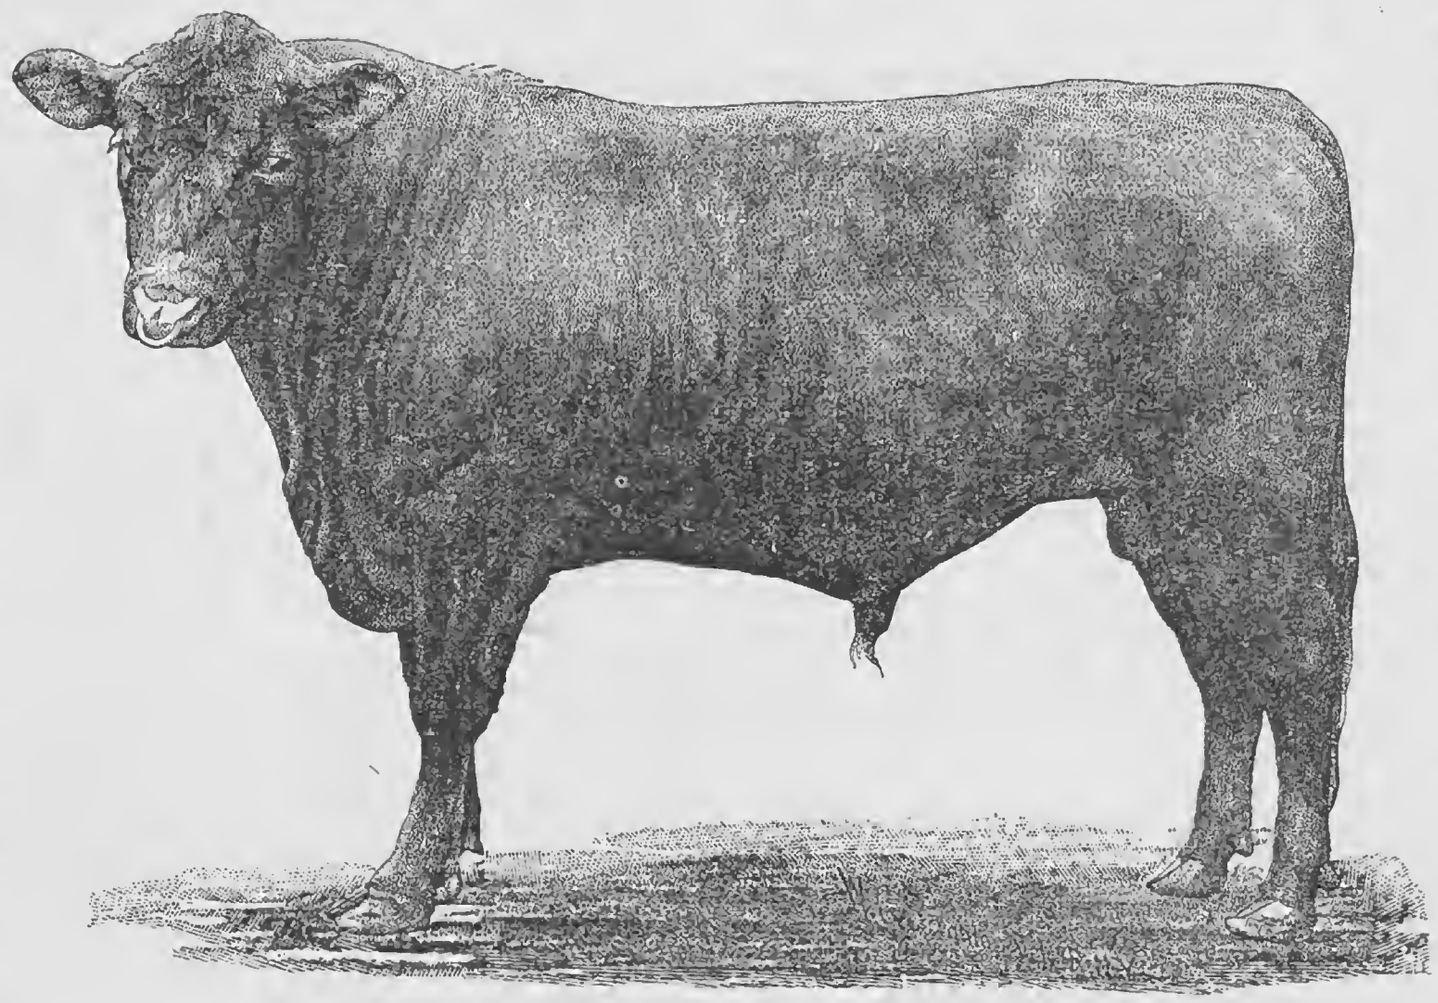
DURING the last quarter of a century much attention has been given to the breeding and improvement of the different strains or families of polled cattle, which for a long time previous, had been a favorite stock with the farmers of a few localities in England and Scotland. The breeders and admirers of the polled cattle in Great Britain now have the satisfaction of noting a rapidly growing demand for their stock at much larger prices than were ever before paid, notwithstanding the general depreciation in the value of other breeds of cattle there during the past few years. They also find their American Cousin, with all of his usual enterprise, promptly on hand, to take an interest in anything superior to that which he has in his own country, and it is with no small degree of satisfaction that they now see the opening of a market for their stock, which may be said to be almost unlimited in its extent, creating a demand that will soon advance prices.

My only wonder is that my own attention, as well as that of others, was not sooner called to the advantages of hornless over horned cattle. During the past five years much has been written and said by American breeders and writers for agricultural papers for and against polled cattle. On the part of some there is a prejudice against them, which may be readily accounted for where parties are interested in costly herds of horned cattle. I have yet to hear of one good reason for preferring horns on our domestic animals. There is no desire to have them on horses and sheep, why on cattle? There will be less of this prejudice when the introduction of hornless cattle shall have become more general, and I predict this at an early date, judging from the preparations now being made for large importations of the improved breeds of the Old Country.

There has of late been a great deal of inquiry with regard to the characteristics of these improved breeds. The great improvements made by the leading breeders of polled cattle in England and Scotland, would seem to have developed representatives of two distinct types or breeds of these animals, which are now known as the "Norfolk and Suffolk Red Polled Cattle," originating with the red or dun polled cow, common in Norfolk and Suffolk counties, England, so far back as the remembrance of the oldest inhabitants, and the improved "Polled Angus or Aberdeen" of Scotland, which probably originated with the Polled Galloway. The Angus are of the same color as the Galloway—black—but are larger and of so much better quality that they are now considered as a distinct breed.

In this article I shall treat only of the Norfolk and Suffolk Red Polled Cattle, which on account of their fine form and stylish, spirited appearance, their beautiful color and their adaptability to the production of either beef or milk and butter, I prefer to either of the other polled breeds. They vary much in size, the cows running from nine to fifteen hundred weight. For my own breeding I prefer a medium-sized cow of from ten to twelve hundred weight. I find that an increase of size, above this, is apt to be gained at the expense of milking qualities, and I prefer to keep two distinct strains; one of medium size, which for dairy purposes will compete with any breed in the country, giving a good mess of milk of excellent quality and holding out well; the other larger and more easily fattened making beef of the finest quality. All of these cattle are very hardy, and are not so much affected by sudden changes of climate as are some of the improved breeds of horned cattle with which I have had experience. The cows, almost without exception, have large teats, a great advantage in the drawing of the milk. Not a few experienced breeders have remarked, upon seeing certain cows of this breed, that, in their judgment, they were a perfect type of what a good dairy cow should be; that they would not know where to suggest an improvement. Mr. P. K Fowler, an English breeder of Short-horns, says, "I have seen the Norfolk for the first time, and I must say I am much struck with the remarkable usefulness and value of the cattle of this district. The cows have good, useful udders, so that they are likely to be capital cows for the dairy. Among the lot we scarcely found an animal but what was fit for the show yard. As a Short-horn breeder, I wish I could put some of the good points I found upon the Norfolk Polled Cattle on the animals I am breeding."

The points of a superior animal as accepted by breeders of these cattle are as follows: "Color: a deep red with udder of the same color, but the tip of the tail may be white; nose not dark or cloudy. Form: a neat head and throat; a full eye; a tuft or crest of hair should hang over the forehead. The frontal bones should begin to contract a little above the eyes and should terminate in a comparatively narrow prominence at the summit of the head. In all other particulars the commonly accepted points of a superior animal are to be taken as applying to the Norfolk and Suffolk Polled Cattle.



POLLED SUFFOLK BULL, "STOUT."—FROM A PHOTOGRAPH.—FIG. 293.

No farmer who has owned a herd of improved polled cattle, will ever again have cattle with horns. A dozen of the polled cattle will drink at the same time from a trough, which would accomodate but one animal having horns. The same number will crowd together, under a shed for shelter the whole space of which one horned animal would consider necessary for its comfort, driving its fellows out. With these polled cattle, the farmer and the shipper of stock need have no fear of damage resulting from the goring of horns. There is now a demand from all parts of the country for young bulls of this breed, the progeny from a cross of these on horned cows being for the most part hornless. The bulls are notably quiet and gentle and are led by a halter with entire safety. Having no weapons with which to fight, they have no temptation to do so. I am confident that the introduction of these cattle here is adding largely to the value of the live stock of the country and to the satisfaction and pleasure of farmers and breeders in handling them.

Putnam Co., N. Y.

Polled Suffolk Bull "Stout."

THE accompanying cut represents the two-year-old bull, Stout, bred by Mr. R. E. Lofft, Troston Hall, Suffolk, England, and imported into this country by G. F. Faber, Patterson, Putnam Co., N Y. He is from an excellent strain, known as the "Handsome" tribe, and he won a large number of prizes at shows in Great Britain.

HEREFORD BULL, PRINCE IMPERIAL 1,796, (6 117).—Bred by J. H. & G. S. Burleigh, of Mechanicsville, Iowa; dropped January 18, 1878, and bought, when about a year old, by G. S. Burleigh, of Vassalboro, Me. He then

AYRSHIRE CATTLE.

HENRY STEWART.

THE Ayrshire race of cattle has an interesting history. It has grown up with its country in an especial manner, and furnishes a remarkable instance of the improvement which may be effected upon the agriculture of a country, the country itself, the people, and the general industries, by an improvement in the cattle of the country. A century ago the agriculture and the condition of the population of Ayrshire were both very miserable. There were no roads; the dwellings were mud cabins with a fire-place in the center, and the chimney a mere opening in the center of the roof for the escape of the smoke; the land was encumbered with rocks and weeds and undergrowth of bushes; there were no green meadows, no carts, no carriages, and no farm-yards, nor any saving of manure for the fields. Oats and Scotch kail were the principal crops, and the people subsisted on oat-meal and kail brose. The land was sown repeatedly in oats; so long as the seed was returned and sufficient grain for the subsistence of the tenant and the demands of the land-owner for his share, which was given as rent, both were satisfied.

The cattle of the country were as poor as their keepers. They roamed over the marshes and preyed upon the oat-fields when the pangs of hunger drove them to abandon their scanty pastures and defy the efforts of their four-footed guardian to keep them from trespassing. In the Winter they starved and often died of hunger, and when the Spring arrived it was usually necessary to lift them upon their feet that they might weakly stagger abroad to seek a little better subsistence than dried brakes and gorse, upon which they had been fed, but not nourished, through the Winter. These cattle were black-and-white, small, bony, and able only to support their calves and yield a little milk, which their owners ate with their oat-meal. They were very similar in character to the cattle of Bretagne (a French race now known as Breton), and some writers, especially Moll and Gazot, the French authors, have supposed that these cattle were the progenitors of the ancient Ayrshires, as communication by sea between France and Scotland was quite common for many years previously, when political associations between these countries were active and close.

The first improvement in the original Ayrshires was made through the introduction of Holstein cattle by the Earl of Marchmont at the latter part of the 18th century. These Holsteins were not of that race of Dutch cattle with which we are now familiar, and which are wrongly styled Holstein—a large black-and-white breed. They were the true Holsteins from the Duchies of Schleswig-Holstein—a red-and-white race—which were then imported freely for the improvement of the Teeswater or Durham stock. They were, in fact, the original Short-horns—large, well-formed animals and good milkers. There is also a tradition current in Ayrshire that about this time some Alderney cattle were brought into the district of Dunlop, in the county of Ayr, and became mixed with the imported Holsteins. In fact, if we were to consider what would be the effect of a union between these two races—the well-formed, large red-and-white Holstein, and the slender Alderney, with its fine head, its dished face and broad forehead, its long and slender neck, its wedge-like form, and its fawn-and-white colors—we should at once recognize in effect the modern Ayrshire, in which the characters of the two races are very evenly mixed and balanced. The large milking property of the Holstein and the rich butter production of the Alderney are precisely mixed in the present character of the Ayrshire, which,

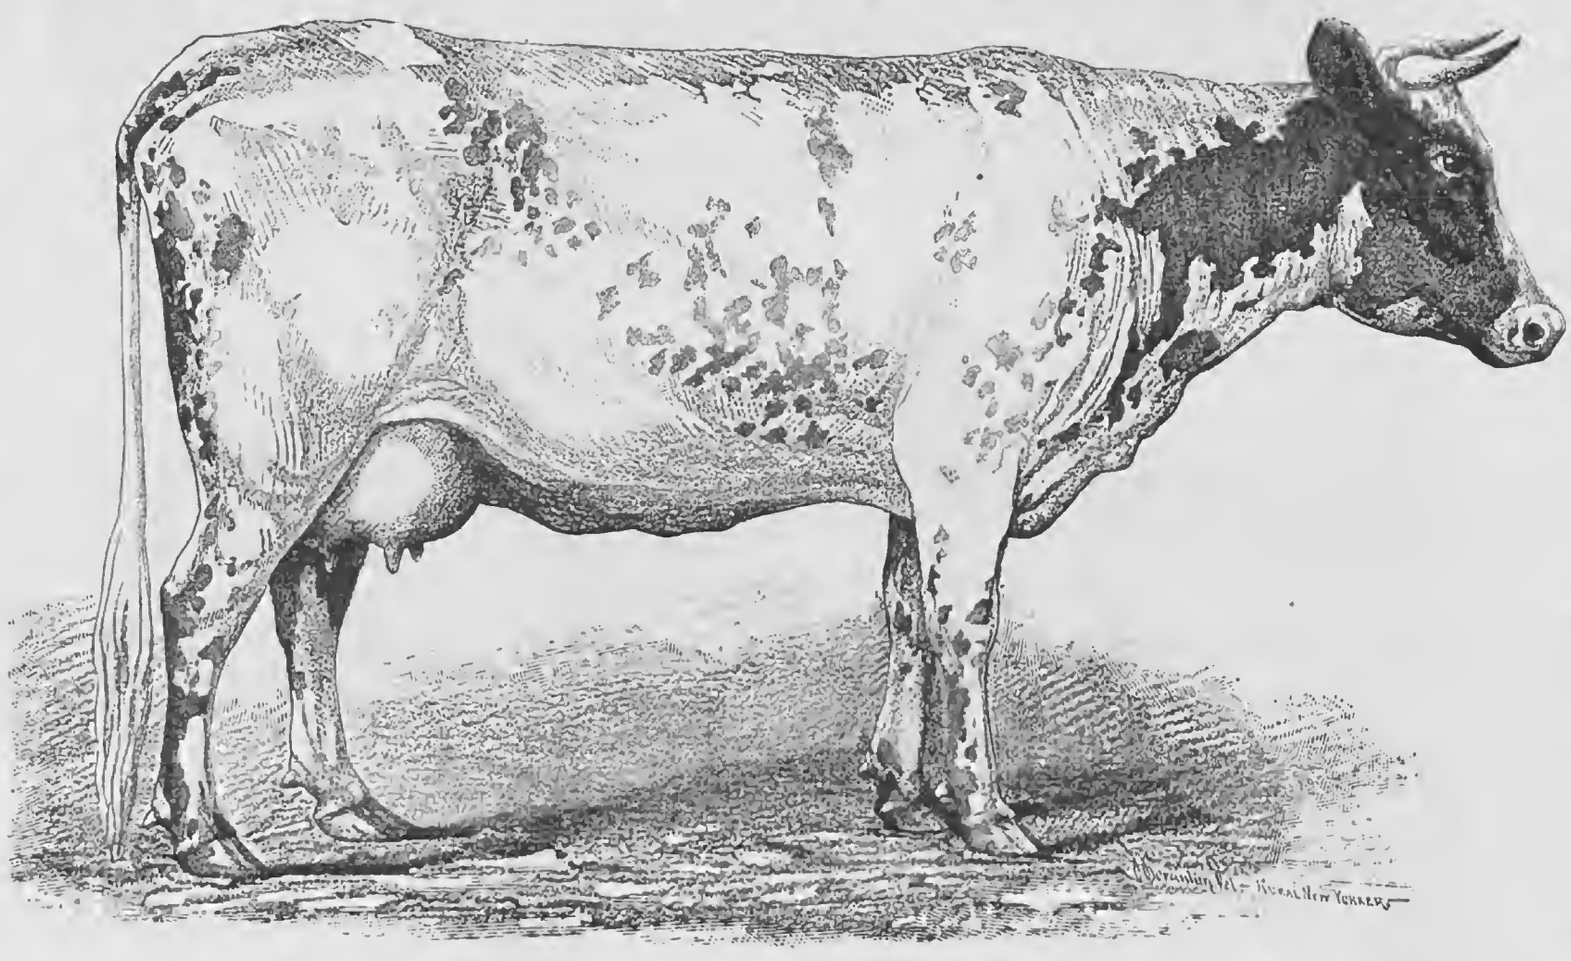
founded upon this mixture, and cultivated and improved by the rapid development of a better system of agriculture that was quickly adopted by the shrewd, industrious Scotchman, as soon as the way was pointed out by the more highly cultured and wealthy land-owners, soon became, in my opinion, the first dairy race of Great Britain, and of the whole world, in fact

The modern Ayrshire cow is a model dairy cow. Without depreciating any other breed of cows, she may easily take this position. She will not displace the Jersey in the fine butter dairy, nor the Dutch cow in the milk dairy; but she will fill the place of both of these in the cheese dairy, and while she will not compare with the latter in amount of milk product, she will greatly surpass the former. She is *the* farmer's cow. Her milk makes a superior cheese, and, being rich in cream, it can easily be turned to profitable butter production. Her average milk product will amount to at least 5,000 pounds a year, and some of the best cows will yield from 6 000 to 8 000 pounds between two calvings. She is easily kept; she is a good and hearty feeder: she is remarkably hardy; her coat is thick and close and warm enough to resist exposure to the most severe Winter storms, and it can sustain the great heats of even the West Indies without discomfort. One of her good points is that she holds on to her milk production evenly nearly up to the time of again calving, and although a cow may not be an excessively large milker in her first freshness, yet by a long-continued and well sustained product the total average is eminently satisfactory to the owner. An example of this may be given in the cow Bolivia—a portrait of which is here given as a fair specimen of an Ayrshire cow. The following figures, taken from the record of her milking with her first calf, dropped when the dam was less than two years of age, give the daily product for the first, the fifteenth and the last day of each month in a year, during which her whole product was a little more than 3 000 quarts:—

1879.	1st. lbs.	15th. lbs.	30th lbs.
March	33	31	30
April	31	34	33
May	29½	31½	30½
June	30½	30½	32½
July	31	29½	29½
August	29	28	26½
September	26	24	21
October	21	20½	19½
November	18	18	20½
December	21½	20	19½
1880.			
January	20	19	19
February	18	18½	17½

Her second calf was dropped in April, 1880, and it was necessary to feed dry hay only, in very limited quantity, to dry her off before she began to spring again. At the present time she is giving 22 pounds a day, from which a pound of butter is made. She has been milking a little over a year, and is due to calve again in August. If there is a fault about the Ayrshire it is the shortness of the teats and the possible coarseness of the head. The latter blemish, however, is only occasionally conspicuous, and is more apparent when Ayrshire and Jersey cows are kept in the same herd, and the fine head of the latter tends to disadvantageous contrast as regards that of the former. Ayrshire butter has a fine flavor, a good color, and is remarkably hard and solid, so that it may be packed well in hot weather. The milk of a good cow will have 15 per cent. of thick cream, and the best cows will surpass this.

Ayrshires have been crossed with the Shorthorn and the Jersey, and both crosses are excellent cows. The first cross is a large, handsome animal, and a deep milker; the second is smaller, finer and a better cow than the average pure Jersey. There are no better family cows possible than these cross-breds. Mr. Thomas Fitch, of New London, Conn., has been breeding this cross for many years with remarkable success, making a special business of rearing cows for family use and for fine butter dairies. Many of his cows produce from one pound to two pounds of butter daily, having the rich milk of the Jersey and the copiousness of the Ayrshire. Finally, the Ayrshire steer is the best of beef, and is quite equal in this respect to the Devon, while it is a docile and patient worker.



AYRSHIRE COW, "BOLIVIA"—FIG. 295

THE DEVON CATTLE.

THESE are acknowledged to be the most ancient of the various English breeds. It is claimed that they were found roaming their particular district of Devonshire at the time of the first invasion of England by the Romans under Julius Cæsar; they have continued to preserve the same characteristics as then, never undergoing any change or admixture, down to the present day. They are of medium size, and exquisitely fine in all their points; indeed, compared with other cattle they are like the Arabian compared with other horses.

The horns are cream-colored with black tips, long and slender, gracefully up-turned in the cows and oxen, but much shorter and lower curved from the head in the bulls. The eyes are like those of the gazelle, with a golden rim around each; the nose a pure orange shade; the skin a rich cream to yellow. The hair is silky in Summer, with an undergrowth of soft fur in Winter, and varies in color from a light to a bright deep red. The only exception to this is more or less white hairs in the switch of the tail, and an occasional white patch on the bag of the cow, particularly in those of the deep-milking families. They are almost as round in the body as a barrel; straight in the upper and lower lines: with deep chest, full brisket, crops, chine, and quarters well let down in the twist.

They are very hardy and thrifty, mature early, are sure breeders, and both large and rich milkers, when bred for this purpose; and at all times they make the best of beef. They are the most active and intelligent of any race of cattle; are easily broken to the yoke or harness; can be trained to walk four miles per hour, and trot six. The latter pace is as natural to them as to an ordinary horse. They make the quickest and best of workers and are the most powerful of all for their size.

Although so fine in bone, it is of such an excellent quality as to prove as strong as the larger and coarser bone of others. To this is joined superior muscle, with the toughest and most elastic cords and tendons. After working till seven to ten years old, they can be turned out to fatten, and make as excellent a quality of beef as when simply fed from birth for slaughter, and disposed of to the butchers when three to four years old. The usual live weight of well fattened, full-grown oxen, varies from 1,200 to 1,600 pounds—though some are still heavier—that of cows from 900 to 1 100 pounds. They are especially well calculated for grazing on light sandy and gravelly soils, and rough stony or hilly grounds. Being of a medium size, and so hardy and active, they thrive in such short pastures as could not support a larger and less alert breed.

The Devons were early introduced into the Eastern and some of the Southern States, where they have ever been found great favorites, and are particularly admired for their beautiful red color. They have also gradually spread to the Western States, and their produce growing up there on a richer soil, with more abundant pasture and grain, have increased somewhat in size, and mature perhaps a year or so earlier. They make admirable steers in that region, and their beef still retains its superior quality. Latterly they have been taken in some numbers to the borders of the Rocky Mountains, and are found especially well adapted to the broken hills and narrow valleys of that immense range of country.

OCEAN TRAFFIC IN NEAT CATTLE.

Importations of Breeding Cattle.

CONSIDERABLE numbers of breeding cattle are received every year from Europe, the kinds varying with the demand in this country. At present, and for some years past, the Jerseys and Guernseys, from the Channel Islands, and the Dutch cattle, from Friesland and North Holland, have greatly the pre-eminence in point of numbers. There is a notable demand for the Polled Angus at present, and though the country is well stocked with Short-horns, Ayrshires, Herefords and other valued breeds of Great Britain, every year witnesses the importation of more or less of them.

These animals are generally shipped upon freight steamers in separate stalls broad enough for them to lie down in and often padded to prevent bruising, and placed between decks or on covered portions of the main deck. They generally bear the trip with comparative comfort, being "off their feed" for a few hours at starting, but soon gaining their appetites and contentment, except in very heavy weather. Plenty of fresh air and good water is essential. The food provided is hay, bran and mangels. The majority of the cattle thus brought to this country are two-year-old in-calf heifers, though a considerable number of young cows and of calves and young bulls come also. Calves do not need separate stalls, but do best in small, loose boxes, with well cleated floors, where several may stand together.

Shipment of Beef Cattle.

About the year 1875 a trans-Atlantic trade in American beef sprung up and gradually increased, reaching a culmination, for the present, at least, in the enormous shipments of last year (1880). American beef, whether transported alive or dead, was regarded at first with suspicion, but rapidly won its way to favor, not a little to the alarm of British feeders, who were undersold in their own markets by beef of equal, or at least excellent, quality. The laws of trade are inflexible, and though it seems a great pity to subject good beef animals to the discomforts of a sea voyage of 10 to 14 days before killing them, during which time they shrink greatly in weight, and probably can never be brought back profitably to their original condition; yet so long as British dealers will pay more for them alive than for their dressed carcasses, transported in cold chambers with good ventilation and received in prime order, we shall be obliged to ship living beef rather than dead.

It is not worth while to discuss now the causes which produced a decline in the demand for American beef, except, perhaps, so far as we may find reasons that we can obviate. On the approach of Winter, and during a hard Winter, farmers market all the beef they can, and this operates to secure high prices in the Spring, and they are high here; but abroad there is little call for American beef, and the prejudice which has been created against it seems on the increase.

So long as the business of shipping live cattle remained in such hands as the Eastmans, the Toffeys and the Gillettes, and was conducted on business principles, everything went well, and we heard nothing of diseased beef from this country; but after the common herd of cattle dealers and speculators (many of them of the Hebrew persuasion) came in for their share, following what are known as "Jewish" ways of doing business—everything for immediate gain, a grand scramble for "the nimble sixpence"—then came complaints of "foot-and-mouth" disease, pleuro-pneumonia and Texas fever.

The fact that our cattle are so healthy as they are is a wonder. Without veterinary inspection, or care on the part of the Government whether they are sick or well at the time of their transportation from one end of the country to the other, it is too much to ask that the Government should provide inspectors to look after the health of cattle shipped abroad. And yet here is a source of enormous wealth slipping through our fingers, so to speak, in part, no doubt, because of this very thing. The facts remain, first, that we are able to raise beef cheaper in this country than in England; second, that we can ship it economically alive, and more economically dead; third, that with the improved cooling appliances it may be so transported as to be undistinguishable, except by experts, from English and Scotch beef of equal quality.

Working Bulls.

INSTEAD of letting my bulls be tied up idle in stables to their great discomfort and often to their injury for want of exercise; or allowing them to roam in pasture, liable at any time to break out into a vicious fit and attack persons or other animals, it has been my practice to work them regularly as oxen, except in the season of service to cows. It is better then to keep them in a stable with a yard attached in which they can exercise at pleasure. By this management they get hardier and more thrifty stock. If I happen to have a pair of fairly matched bulls, they are yoked together and worked the same as oxen. If in possession of only a single bull, I either procure a stag of equal strength to match him, or work him alone in a yoke and harness made expressly for this purpose. In lumbering, at times I have had a powerful bull as the leader of a half dozen or more yoke of cattle, and an admirable one he made and was as quiet and easily managed as any other animal of the team. In this way the bull earns his keep, or even more, and I get his service to my cows free of cost. "WESTERNER."

THE CATTLE OF GUERNSEY.

MASON C. WELD.

THE cattle of Guernsey, whatever their origin and however noticeable their kinship to those of the sister island of Jersey, are an entirely distinct breed, having such pronounced merits that a breeder, if he be inclined to breed for butter, may well question to which breed he should give the preference. The best specimens are decidedly above medium size, many of them approaching the Short-horns in magnitude. They are of good form, with deep, capacious barrels, not lacking in beef points, growing quickly and maturing early. The cows reach the hight of their flow of milk and greatest weight at about five to six years old. The oxen are of good size, willing and docile. As beef animals they fatten economically at any age above two years, and their beef is of excellent quality, the fat being laid on evenly and the meat well marbled. The calves are usually large when dropped, and make heavy veals when five weeks old, the Guernseys and their grades showing thus, both in respect to beef and veal production, a great superiority over the Jerseys.

It is, however, as a producer of milk and butter that the Guernsey cow has her special value. Like that of the Jersey, her milk is of extraordinary richness. It is doubtless fully as rich as that of average Jerseys, and in the matter of color, very much superior. The color of Guernsey butter is so intense a golden yellow in June and throughout the Summer as to be actually distasteful to many persons, so strong is the impression that the color is unnatural. This color, to a less degree, is seen both in the milk and cream, to which it imparts a rich look which is very agreeable. Guernsey butter pales somewhat during the Winter, being ordinarily at its lightest in March, if the cows are fed principally on hay. The majority of them carry the color of their butter well through the Winter, so that it is never necessary to use annatto or other dye to give Guernsey butter an agreeable tint. In this particular the butter of the Guernsey contrasts strongly with the lard-colored product of most cows, including many Jerseys. Among Guernseys, cows yielding 18 and 20 quarts of milk are not rare, and the yield of 14 to 18 pounds of butter per week has been repeatedly reported.

The Guerneseys and Jerseys cross well, and blend their good qualities admirably, the cross-bred animals exhibiting the fine stature of the Guernsey combined with the more elegant form of the Jersey; in fact, making the model milch cow in every particular. The butter of the cross-breds is usually of a character combining the firmness and waxiness of the Jersey with the richer color of the Guernsey. In fact, no better use can be made of unregistered Jersey cows than to cross them with Guerneseys, for in the cross we are almost sure to have the best qualities of the two breeds developed.

Grade Guerneseys possess the qualities of the Guernsey breed to an extraordinary degree, ordinarily exhibiting them in the color and quality of the skin and in their milking and feeding qualities. The quantity of milk and both the quantity and rich color of the Guernsey butter are observable also in the grade cows. The Guerneseys are, therefore, pre-eminently adapted to those regions where farmers make butter and where beef and veal are regarded as important farm products.

The earliest importations of Guerneseys into this country were probably made at a time when no distinction was made between the different breeds of the Channel Islands, and Jerseys and Guerneseys passed under the name of Alderneys. In 1840 Mr. Nicholas Biddle, of Philadelphia, imported Guerneseys under their proper name, and established a herd of rare excellence, which is still in existence in the hands of his son, the Hon. Craig Biddle. Other isolated herds in New England and in the State of New York fairly introduced the breed to American breeders, and it has steadily increased in popularity from the first. In 1878 the American Guernsey Cattle Club was formed, and the first volume of the Guernsey "Herd Register" was published, since which time the number of breeders and of pure-bred cattle has greatly increased. Within a few years a Herd Book has been established by the Island breeders, so that now the systematic improvement of the breed and the maintenance of its valuable characteristics may be expected to go on both in this country and in the Island of Guernsey upon well established principles.

Large numbers of Guernsey cattle—chiefly two-year-old, in-calf heifers—are annually exported from the island to England, where they have long been great favorites. The importations of Guerneseys to this country have never been so great as during the past year, and in point of excellence the recent importations compare most favorably with any that have ever been made. The Guernsey herds of the United States are located chiefly in New England, New York and Eastern Pennsylvania.

Jersey Cow, Martha of Roxbury. 5016.
(Illustrated below.)

Dropped Jan., 10 1872; color cream, fawn and white; Sire, Vanguard 845; dam, Fanny Stanard 5015. This cow has taken, alternately with her dam, first and second premiums at the Virginia State Fairs, as best Jersey cow over three years old, and also first premium as best dairy cow of any age or breed. She is of the noted strain of Jerseys of the late Wm. C. Wilson of Maryland, and is one of the foundation stock of the Jersey Herd of the Messrs Rowe's Co-operative Stock Farm, Fredericksburg, Virginia.

POLLED ANGUS COW, PRINCESS 8th (3,298)

(See Illustration on next page.)

BRED by Thomas Ferguson, Kinnochtry, Coupar Angus, Scotland; calved April 16th, 1878 Imported by F. B Redfield, Batavia, N. Y., October, 1879. By Shah (608); dam, Princess 2d (916) by Young Hugh (131); 2d dam, Princess of Kinnochtry (914), by President 31 (246); 3d dam, Prizie (586), by Black Jock (3); 4th dam, Young Favorite (61), by Grey-breasted Jock (2); 5th dam, Old Grannie (1)

Old Grannie (1), the head of the Princess and Baroness tribes, was bred by the late Hugh Watson, of Keillor, the first great improver of Angus cattle, and was calved in 1824 Although she is the first of her line recorded in the Polled Herd Book, and the earliest animal in point of time recorded, it is well known that she was descended from a maternal line which had been in the hands of Mr. Watson from the year 1808, when he received the stock from which her ancestors came from his father, who was breeding Angus cattle as early as 1768.

Mr. Watson for many years was unconquered in the show ring with his Angus cattle, and his victories began in 1829, when he won the first prize in the class for aged cows at the Highland Society Show with Old Grannie (1). From that time to the present, in the hands of both Mr. Watson and Mr. Ferguson, the Grannies—now known as the Princesses and the Baronesses—have in every generation produced prize-winners. Old Grannie was a very remarkable cow. She lived until very nearly 36 years old and produced 20 calves that were prize-winners. The cow next to her, Young Favorite (61), was a Highland Society first prize-winner. Prizie (586), Princess of Kinnochtry (914), and Princess 2d (916), also won important prizes against strong competition. In 1878 Princess 6th, a daughter of Princess 2d and a full sister to Princess 8th, was first in the yearling class at the Highland Society Show at Dumfries, and in 1880 Prince of the Realm, *sixteenth calf* of Princess of Kinnochtry (914), was first in the class for two-year-old bulls at the Highland Society Show, at Kelso, beating such good ones as Justice, Young Juryman and Bombastes. Kelso was the only place at which Mr. Ferguson made a show in 1880, and Prince of the Realm, whose likeness appeared in the RURAL of April 16, was the only animal he fitted for show purposes. The result as above was highly satisfactory, for he was placed first over three young bulls unbeaten in many show rings that year. Princess was only 19 months old when the likeness on page 386, was taken.

RURAL BRIEFLETS.

WHEN a group of animals possess certain characteristics which distinguish them from others of the same species and which have become so firmly established that they are uniformly transmitted from parent to offspring, they are properly recognized as a distinct breed. These special characteristics may include peculiarities of appearance, as the absence of horns in the polled breeds, and the red color of Devons; of function, as the quantity of milk of the Holstein and the quality of milk of the Jersey; of locomotion, as the trot and pace in the horse; of habit or instinct as exemplified in the setter or shepherd's dog—in fact, any standard that fancy may dictate may be assumed.....

HEREDITY is the principle in accordance with which the normal characters, the constitutional diseases and sometimes the acquired habits of the parents are transmitted to the offspring....

THE distinguishing peculiarities of the various breeds of cattle are the result of the inheritance of characters that adapted them to the conditions under which they orignated. In the "improved" breeds, certain desirable individual peculiarities that have appeared, spontaneously or accidentally, have been engrafted by heredity upon those of the original breed.....

IN breeding, the parent that seems to exercise the greatest influence upon the character of the offspring is said to be prepotent, and since in pure-bred animals the dominant characteristics of all the immediate ancestors are the same, their prepotency, or power of transmitting their characteristics, is greater than that of "native" animals. The more closely in-bred a family, the stronger, it is found, is the prepotency of its members, and in some cases in-and-in breeding has been limited to families set apart to produce breeding sires, for as the male is practically half the herd for breeding purposes, it is especially desirable that he should be able to transmit his excellencies in a pre-eminent manner.....

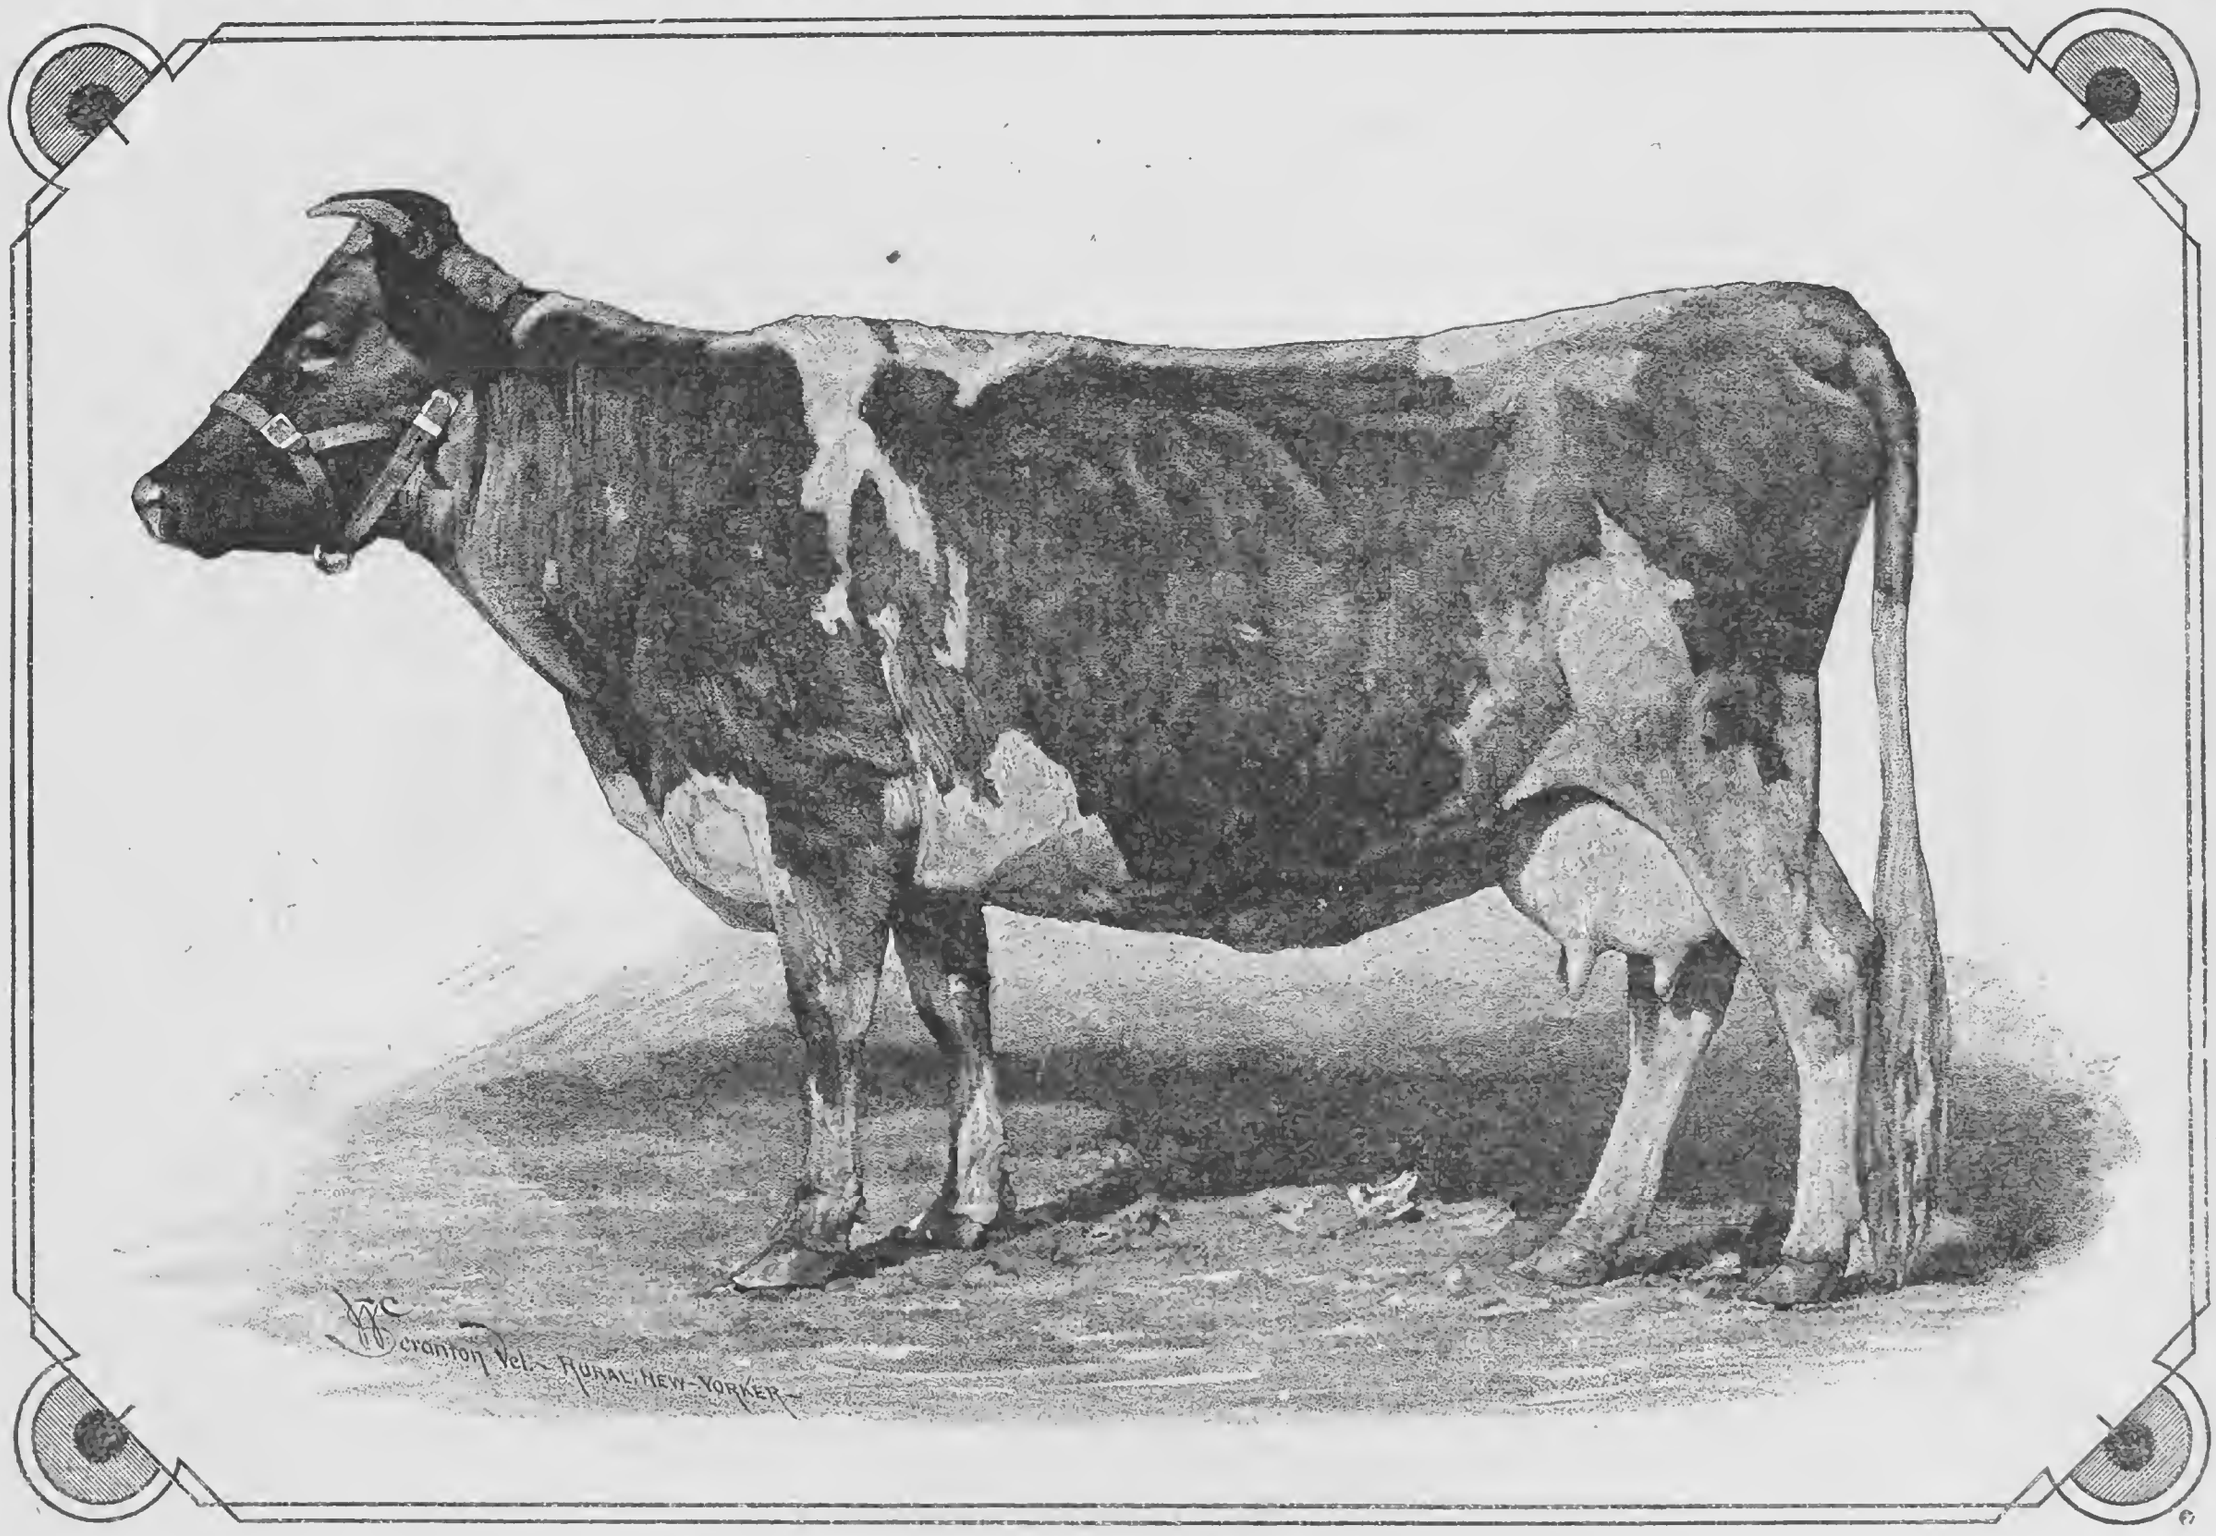
THE flesh of Short-horn or Hereford grades is often better than that of the pure-bred animals; chiefly because the fattening qualities of the latter have been so highly developed as to lead to an excess of fat coupled with a deficiency of lean, while in the flesh of the grade the proportion of lean and fat is more highly valued by the butcher.....

EXPERIENCE has shown that in breeding the influence of the first male parent is not limited to the immediate offspring, but generally extends also, through the female that has been impregnated, to her progeny by another male. It is therefore of special importance that a superior bull should serve a heifer for her first calf.....There is good reason to believe that, although this peculiar influence of the male is most intense in the first impregnation, yet subsequent impregnations by other males have modified permanent influence.....

AMONG the general public there is often a good deal of ignorance or misconception as to the meaning of terms in common use among breeders. Of these the most frequently met with are the following:—"Thoroughbred," strictly speaking, is a term that designates the English race-horse and his descendants in this and other lands, and in this sense it has been commonly used as the name of the breed, just as Clydesdale and Norman designate breeds of draft horses. In this country, however, the term is frequently applied to cattle, sheep, swine, and occasionally even to other breeds of horses in the sense of pure-bred.... "Pure-bred" and "full-blood," according to the definition of the American Association of Short-horn Breeders, indicate animals of a distinct, well-defined breed without any admixture of other blood. The same authority also adopted the following definitions, which coincide with the general signification of the terms, although writers in the public press not infrequently misapply the words. "Cross-bred" animals, strictly speaking, are those produced by breeding together distinct breeds, such as the Ayrshire and the Jersey; but the terms crossing, making a cross, out-breeding and cross-breeding are often used to indicate the mixture of the blood of different families of the same breed. "Grades" are the produce of a cross between a "pure-bred" and a "native," such as a Short-horn and a Texan, a Holstein and an ordinary cow or bull.....

"NATIVE" cattle are animals of mixed blood without any fixed character, constituting the vast majority of the herds throughout the country.....

"HIGH-GRADE" refers to an animal of mixed blood in which the blood of the pure



JERSEY COW, MARTHA OF ROXBURY, 5016.—FROM A PHOTOGRAPH.—FIG. 296.

breed largely predominates. Thus if the offspring of a grade Hereford is again crossed by a pure-bred Hereford, and the same practice is followed for a couple or more generations, the progeny will be "high-grades." CLOSE breeding is the coupling of animals that are closely related; while in-and-in breeding implies the closest possible relationship in the animals bred together.....

HIGH-BREEDING is sometimes used in the sense of close-breeding; but properly it means a careful selection of breeding stock with reference to a particular standard and within the limits of a particular family, regardless of relationship. Breeding-in-the-line means the selection of males from a particular family, without reference to the quality or uniformity of the selected animals.....

IN speaking of the parentage of animals the term "got by" or simply "by" refers to the sire and "out of" to the dam.....

WITH regard to the recorded pedigrees of the different breeds of cattle, in the Short-horn and English Hereford Herd Books the males alone have a number, while the females are designated by the name of their sire followed by the word "by." In the Devon, Jersey, Am. Hereford and Ayrshire Herd Books both the females and males have distinguishing numbers. Open numbers refer to the American Herd Book; those in parenthesis, ( ) to the English Herd Book, while the numbers of the Canadian Short-horn Herd Book are inclosed in brackets [ ] .....

To illustrate the above here is the pedigree of the progenitor of the American Dukes of Airdrie, known in Kentucky as the "Old Duke:"

9,798, DUKE OF AIRDRIE (12,730); red and white, bred by R. A. Alexander, Airdric, Scotland, and imported to his farm in Woodford Co., Ky.; calved Aug. 4, 1854, got by imp. Duke of Gloster, 2,763 (11,382), out of Duchess of Athol, by 2d Duke of Oxford (9 046),—Duchess 34th, by Cleveland Lad (3 408),—Duchess 49th, by Short Tail (1 423),—Duchess 20th, by 2d Earl (1,511),—Duchess 8th, by Marske (418), Duchess 2d, by Ketton 1st (709),—Duchess 1st, by Comet (.55),—by Favorite (252),—by Hubback (319) —the Stanwick Cow, by J Brown's red bull (97). This is from "The American Short-horn Herd Book," Vol. X, page 107, compiled by our contributor Lewis F. Allen. The dash — is used to indicate the "next dam," to economize space.....

MR BAKEWELL regarded live stock as machines for converting the vegetable products of the farm into animal products of greater value.....

AMONG cattle the best animal is that which converts the largest amount of food into beef or milk of the best quality, with the least possible waste of material.....

IT is a not uncommon error to imagine that animals that eat but little are the most profitable; so long as an animal is capable of digesting and assimilating it, the greater the amount of food it consumes the more profitable are the returns; for the *proportion* of the food that goes to supply the waste of tissue and run the animal machinery is less when a large than when a small amount is eaten.....

ANIMALS with excellent digestive and assimilative capacity are therefore the best; for an animal that can digest and assimilate only enough to keep the animal machine in running order, is worthless; for it is only from the food assimilated *in excess* of this amount that any profit can be obtained.....

THE great advantage of all the improved breeds of live-stock over the common or "scrub" sorts is that they convert a larger proportion of the food they consume into animal products and these usually of a better quality.....

IN every breed of live-stock there are favorite families prized as breeders for the persistence with which they stamp their peculiar excellencies on their offspring. In the first rank among this sort of cattle are the Bates and Booth families of Short-horns, the Dishley family of Long horns, the Ben. Tompkins sort of Herefords and, of late among us, the Alphea family of Jerseys.....

ATAVISM—from *atavus*, an ancestor—is that form of heredity in which any peculiarity of an ancestor, more or less remote, whether of form, color, habits, mental traits or predisposition to disease, makes its appearance in the offspring without having been observed in the parent. Darwin calls it "reversion," and the farming community have long known it by a variety of names, such as "throwing back," "harking back," "crying back," "breeding back," etc.....

IT is the tendency to "breed back" in this way that renders cross-bred animals as breeders of little value for the improvement of stock; for this tendency is found to be very strong, and generally towards inferior ancestral qualities, probably because the superior qualities of the better-bred parent are more artificial.....

THE small, hardy Kerry cattle of Ireland, owing to the scanty food got with much effort on their own native hills, develop so slowly that heifers, it is said, do not breed until six or seven years old. Animals of this breed well cared for in Massachusetts, grow larger, mature earlier, and the heifers breed when three years old—an instance of the effect of environment on development.....

WHEN twin calves are produced, one a male and the other a female, the latter is called a free-martin, and in nearly every case is barren; the reproductive organs being generally imperfect, partaking of the characteristics of both male and female organs. When grown the females frequently resemble steers. The bull, in such cases, is fertile. When both twins are females the reproductive powers are not impaired.....

ACCORDING to M. Thury's theory of sex, this "depends upon the degree of maturity of the egg at the moment of fecundation, that which has reached a certain degree of maturity producing a female, and, if fecundated when this point has been passed, producing a male," so that if females are served during the first half of the period of heat, female offsprings should largely predominate; but if they are served during the last half, males should be the more numerous. Experience, however, does not appear to support this theory.....

WHAT is called the Stuyvesant theory of breeding is that the sex of the offspring depends entirely on the female, and that every alternate egg or ovum presented for impregnation is female. Accordingly, after a cow has produced a heifer calf, Mr. S. does not allow her to be served when first she comes in season; but waits until the first part of the second heat. Should she not "catch," he again waits till heat number four, passing over number three, and so on until she does "catch." If she has produced a bull calf, however, she is served the first time she comes in season.....

"FANCY POINTS" are peculiarities of form or color that do not represent any valuable qualities. The solid color and black points of the Jerseys, the red and dark roan of the Short-horn, now so fashionable, are cases in point...."Solid colors" are uniform colors, in contradistinction to mixed or mottled.... The black points of a Jersey, are a black nose and switch, and black tips to the horns. Undue attention to the production of "fancy points" tends to retard improvement in breeds and lessen their value for practical purposes by encouraging the selection of breeding stock with a view to the production of these "points" rather than of qualities really useful. When a peculiarity, even if trivial in itself, is characteristic of the breed or of some family in it of extraordinary excellence, it cannot be considered a "fancy point," and is of real value as an indication of the inheritance of the qualities of the breed or family.....

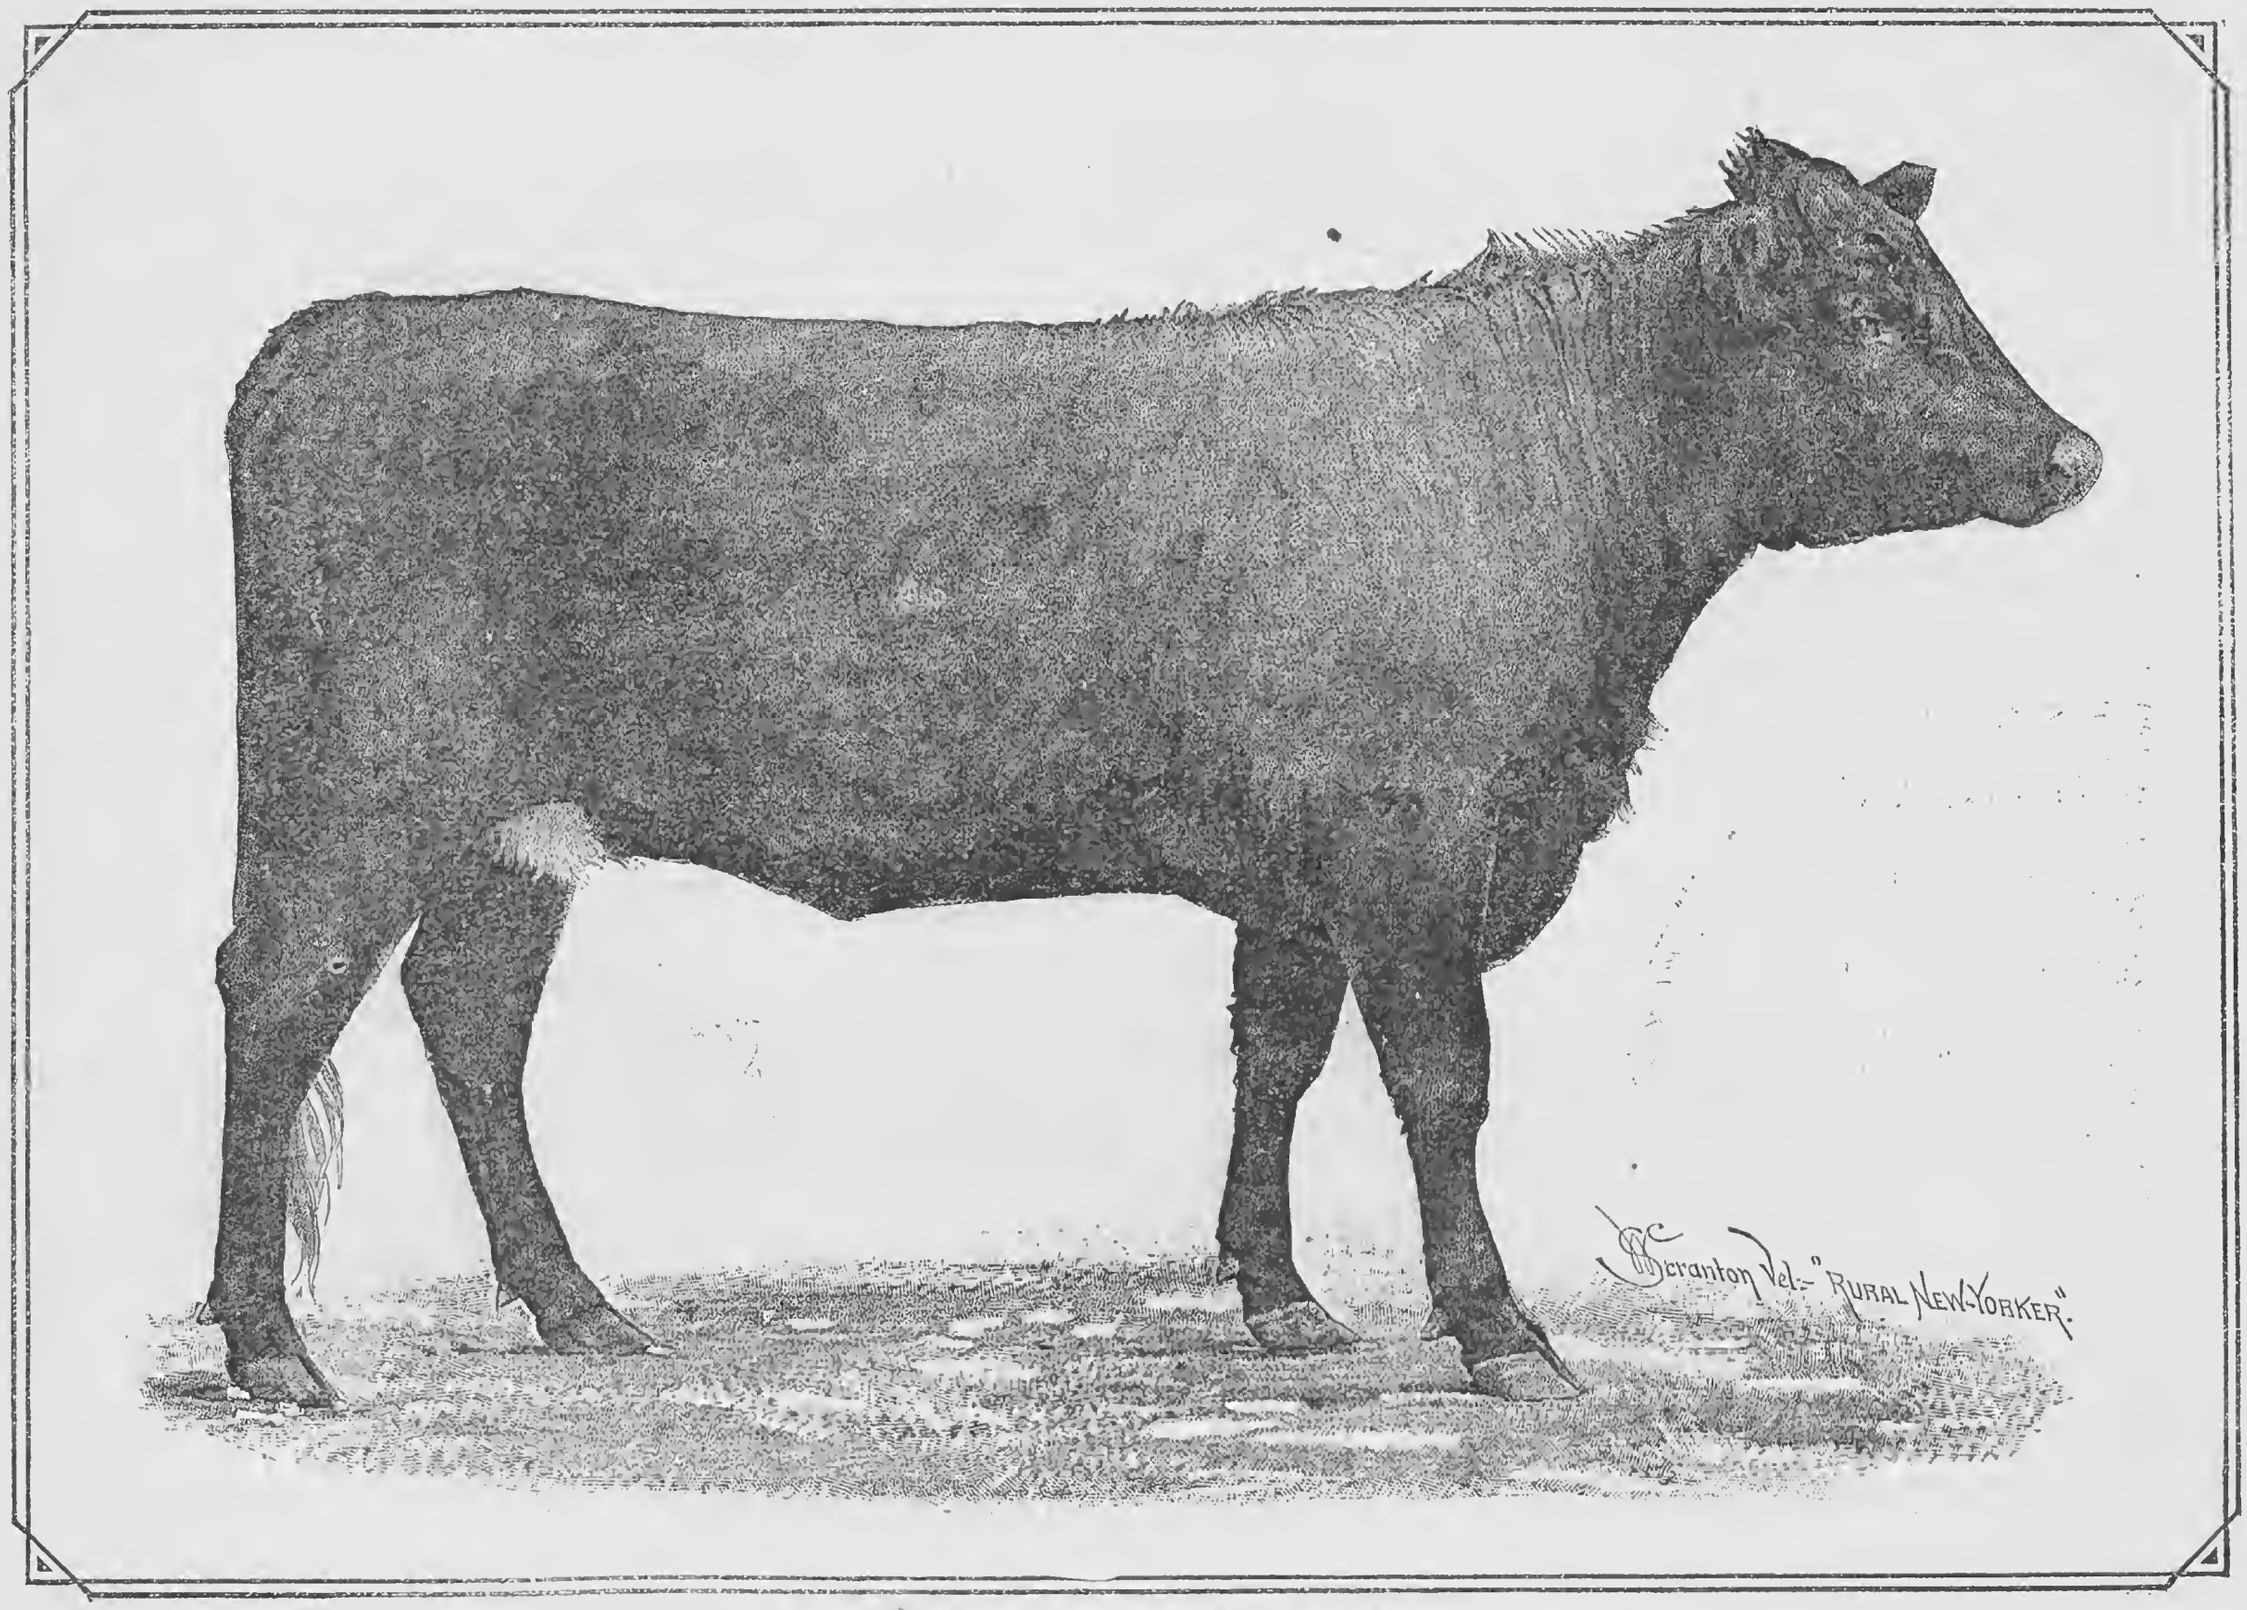
"FATTY DEGENERATION," a frequent cause of sterility, is the transformation of the substance of the generative organs into fatty tissue. Dr. Carpenter says this form of degeneration, which is common to nearly all tissues, consists in the conversion of their albuminous or gelatinous materials into fat. The reproductive organs of very fat animals are often affected with fatty degeneration to an extent that entirely destroys their functional activity.....

THE average period of gestation in a cow is 285 days, the extremes in 1,907 cases being 220 and 313 days; only a very small proportion, however, were under 260 or over 295.....

BEASTS with small chests do not fatten readily and are very susceptible to disease.

What Others Say.

VARRO compares tillage and the keeping of live stock to two different-sounding instruments in an orchestra, and he terms the grazier's trade the treble and the tiller's occupation the base, each aiding in the harmony as a whole. . . . . Fitzherbert puts the same idea.



POLLED ANGUS HEIFER, PRINCESS 8th.—FROM A PHOTOGRAPH.—FIG. 297.

that time a polled animal was born with all the characteristics of the original breed. On the other hand, horns occasionally appear on the Galloway, Norfolk and other polled breeds that have been bred pure for generations.

Herbert Spencer, in speaking of the transmission of characteristics from parents to offspring, says: "There must arise, not a homogenous mean between two parents, but a mixture of organs, some of which mainly follow one parent and some the other." The chief characteristics in some cases, however, are inherited from some remote ancestor on one side or the other, while the dominant characteristics of the parents may become latent in the progeny. . . . . The general experience seems to be that the secretion of large yields of milk is incompatible with the accumulation of abundant fat. It is not claimed that rapid-fattening qualities cannot be combined with good milking properties, but that it is easier to excel in one than to develop both. One of the advantages which Short-horn admirers claim for them over their rivals, the Herefords, is that they are better milkers, and this is undoubtedly true. Mr. Price, an extensive breeder of Herefords, however, says: "Experience has taught me that no animals possessing form and other requisites giving them a disposition to fatten, are calculated to give much milk; nor is it reasonable to suppose they should—it would be in direct opposition to the law of Nature. Had I willed it 20 years ago, I could by this have had 20 cows from my own herd, which could have given a sufficient quantity of milk for dairy purposes, and I am confident that, in the same time, I could have had a similar number that would not, at any time, have given 20 quarts of milk a day among them." And he is confident he could effect either of these objects much more easily than he could blend the two properties in the same animal. . . . . Professor Tanner, of the Agricultural College, Cirencester, Eng., one of the best authorities on the subject, says that when the rainfall is small and the herbage more than usually scant, much difficulty is found in getting ordinary farm stock to breed, a dry dietary being very unfavorable for breeding animals and very much retarding successful impregnation. On the other hand, rich, juicy and succulent vegetation is very favorable to breeding. . . . . In another place he remarks that the non-impregnation of the female may generally be traced to an excessive fatness in one or both of the animals and an absence of constitutional vigor. The breeding powers are most energetic when animals are in moderate condition, uninfluenced either by extreme fatness or leanness. . . . . He is also of opinion that the most prolific breeders are usually good milkers and produce the most healthy and vigorous offspring. . . . . Earl Spencer says that the worse bred the female is, the greater the influence of a well-bred male upon the offspring, and Prof. Miles says this accords with the experience of practical men generally. . . The latter adds that if a cross of two distinct breeds is effected by the selection of animals of equal power in the transmission of their peculiar characteristics, the tendency is to make dominant the original characteristics the herds had in common, and to obscure the special characters that constituted their distinguishing characteristics. In such cases he thinks the offspring would be likely to prove inferior from inheriting the defects of both parents, without retaining the most desirable qualities of either. . . . . In making such crosses it is insisted that the male should not only possess superior merit in general characteristics, but he must be specially prepotent in transmitting them. . . . . The benefits of cross-breeding, according to Mr. Spooner, are most evident in the first cross. . . . . Stonehenge says: "The purer or less mixed the breed, the more likely it is to be transmitted to the offspring. Hence whichever parent is of the purest blood will be generally more represented in the offspring; but, as the male is usually more carefully selected and of purer blood than the female, it generally follows that he exerts more influence than she does, the reverse being the case when she is of more unmixed blood than the sire." In other words, the best-bred parent has most influence on the offspring. . . . . Referring to the influence of the first male parent upon offspring by another male, Dr. Carpenter says: "Some of these cases appear referable to the strong mental impression left by the first male parent upon the female; but there are others which seem to render it more likely that the blood of the female has imbibed from the fœtus through the placental circulation, some of the attributes which the latter has derived from the male parent, and that the female may communicate these with those proper to herself to the subsequent offspring of a different male parentage. . . . . On this subject Agassiz says that the act of fecundation is not limited in its effects, but that it affects the whole system, the sexual system especially, and in this system the ovary to be impregnated afterwards, is so modified by the first act that later impregnations do not efface the first impression. . . . . Darwin, speaking of the pollenation of plants, confirms this theory.

Stock and Poultry.

HOLSTEIN CATTLE, CLYDESDALE HORSES, HAMBLETONIAN HORSES.

The Largest Herd of Holstein Cattle in America, with Deepest Milk Records yet Known.

IN TH'S HERD ARE —

"AGGIE," 6-year-old record,	18,004 lb. 15 oz.
"AEGIS," 6-year-old record,	16,823 lb. 5 oz.
"NETHERLAND QUEEN," 2-year-old record,	13,574 lb. 3 oz.
"LADY OF THE LAKE," 2-year-old record,	12,200 lb. 4 oz.

Entire herd of mature cows averaged 14,164 lb 15 oz., and two-year-old heifers that have milked over ten months averaged 9,681 lb. 15 oz. Our Holsteins are all selected and imported by us in person from the best herds of Holland.

FORTY elegant CLYDESDALE Stallions and Mares, mostly imported.
SIXTY HAMBLETONIAN Stallions, Mares and Fillies, of superior breeding and quality.

RARE INDUCEMENTS OFFERED TO BUYERS.

SATISFACTION GUARANTEED. CORRESPONDENCE SOLICITED.

SMITHS & POWELL,
199 West Genesee Street, Syracuse, N. Y.

HOLSTEINS.

Our Herd was personally selected in Holland by one of our firm, as the choicest animals he could purchase, regardless of cost.

The first season in this country, before they were acclimated, nearly all, in SEVEN months (and some in six) EXCEEDED the quantity of milk required of them in a year by the Holstein Association to entitle to registry in the "Special Milk Record."

We now have only

15 2-Year Heifers in Milk,

7 of which have given in a day 50⅔ up to 59 lbs. 6 ozs. of milk; and every one 40⅔ lbs. and up.

In 30 days 2 have given over 1,529 lbs.; 12 have given over 1200 lbs. each; the lowest 1,067 lbs.; the highest 1,575 lbs. We

Offer Their Progeny,

AND CAN FURNISH ANIMALS NOT AKIN.

Catalogues furnished. Inquiries answered.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, JUNE 11, 1881.

THE RURAL NEW-YORKER begs to offer in articles of its own selection, for the longest and heaviest five heads of wheat from the present crop, $50.00, to be divided into first, second, third, fourth and fifth premiums. The awards will be published in our Special Wheat Number, and drawings presented of the prize heads.

THOSE who, competing for our wheat premium, send us heads of wheat, must not neglect to write both name and address upon the boxes or parcels containing them. This is now permitted by the postal laws.

THE next Special RURAL NEW-YORKER will consider the crop prospects of the country. The next thereafter will be the Wheat Special. Our friends are solicited to send us any interesting facts regarding wheat—either as to varieties, yield or cultivation—that may have transpired in their experience.

THE most profitable method of rearing cattle is to give them all the food they can digest well from their birth up to the day of their slaughter, if reared for bullocks. But if for working oxen, bulls and cows for breeding, then feed no more than to keep them in prime working and breeding condition. An ox may be too fat or too poor for good work and so may a bull to get first-rate offspring, or a cow to do well in the dairy or as a breeder.

OUTLOOK FOR CROPS IN ENGLAND.—Yesterday's cablegrams from England speak discouragingly of the outlook for next harvest. The drought and cold east winds that have prevailed continuously since seeding time, have almost ruined most of the cereal crops, except wheat, and in most districts that is poor and thin. All growing crops are, as a rule, exceedingly backward, and the present prospect is that there will be a late and scanty harvest. Down to last Saturday, June 4, there had been but two showers since May 4, and fields generally were parched. Already hundreds of fine farms have been thrown on the landlords' hands; and it is estimated at least 70 per cent. of the tenants are in arrears. After the late era of agricultural depression, farmers have been trusting to a good harvest this year to enable them to pay off the arrears of rent and often other indebtedness, and it is to be feared the partial failure of crops now threatened will entirely discourage and ruin thousands of them.

ON seeing the high prices often paid for choice specimens of pure-bred stock, it often occurs to the ordinary reader that the value of the animals is vastly overrated and that by no possibility could they be worth "that" amount of money. There is no doubt that extravagant prices are sometimes paid for "fancy points," strains "on the beom" and speculative purposes; but in most cases, when high figures are given for breeding stock, there is a fair prospect that they will prove fully worth all that is paid for them. If, for instance, the use of a particular bull will enhance the selling price of the calves from a herd of 50 cows $50 above what they would bring if the progeny of an ordinary bull, $2,000 would certainly not be too high a price to pay for the superior animal which could be used for a number of years. Increase the number of cows served and the difference in price between the offspring of both sorts of sires, and the real value of the better beast is increased proportionately. The same rule, of course, applies to cows bought for the purpose of breeding high-priced bull and heifer calves.

NEVER FROM BETTER TO WORSE.—"And take hede where thou byeste any lean cattel or fat, and of whom, and where it was bred. For if thou bye out of a better grounde than thou haste thy selfe, that cattel will not lyke with the" So said Fitzherbert more than three centuries ago, and the caution is as applicable to our conditions to-day as to those of England under "Bluff King Hal." Accordingly before investing in any sort of stock with which he is unacquainted, the farmer should learn what he can about it, so as to be able to obtain the kind which will thrive best on his land and with the treatment he intends to give it. None of the improved breeds will maintain their full excellence under the neglectful treatment the "native" or "scrub" sorts frequently meet with. Their desirable characteristics are, in no small measure, the result of attentive care and feeding, and in the absence of these, they are sure to deteriorate, some breeds, however, falling off worse than others, according to the difference between their present conditions and those under which they originated and according as their characteristic "improvements" are more or less artificial, or due to extra care. It may be taken for granted that when cattle, whatever their quality, are taken from where they have had abundant feed and good care, to where they are allowed to shift for themselves often with scanty rations, they will be sure to disappoint the owner. For thrifty stock the rule should be, "from worse to better, never from better to worse."

THE BEST BREED?

WHICH is the best breed of cattle? Before this question can receive a proper reply, two others must be answered: For what purpose? and, Under what conditions? If for beef, the Short-horn, Hereford, Devon and Polled Angus are all excellent where feed is abundant and there is shelter in severe Winter weather. Where feed is not plentiful, the Devon can get along better than the two first because lighter and more active, and so can the Angus because more accustomed to "rough it." Its thick skin enables the Hereford to withstand the rigors of Winter pretty well, and the polled Scotch is more accustomed to severe weather than its more southern rivals. Grades of any of these breeds are hardier than the pure-breds and if moderately high grades, the flesh is of an excellent quality. If beef and milk are wanted, then the Holstein, Polled Norfolk and Suffolk and Short-horns of a milking tribe like the Princess, or of a milking herd, such as are raised in several parts of the Eastern States, are the best. Here again the progeny of pure-bred bulls on good native cows often give a great deal of satisfaction. If milk for market is wanted, the Holstein and Ayrshire are hard to beat; but the former requires considerably more feed and attention than the latter. If butter and cheese are needed, then the Ayrshire, milking Short-horn, and, perhaps, the Holstein are the most desirable; while the first and last are the best for cheese, and the Jersey, Guernsey, Ayrshire and crosses of the two first, or of the two first and the third, are best for butter. If a draft ox is needed, the Devon comes first for all ordinary purposes; but the Hereford, being stronger, is better fitted for heavy loads in a rough country. All these breeds, except the Jersey, fatten well when dried off; but in this respect the Short-horn and Holstein are ahead of the others.

CROSSING WHEATS.

FOR the past week, two of the RURAL staff have spent a considerable portion of the time in crossing wheats at the Rural Farm. Do wheats cross with each other or are they self-fertilized or close-fertilized? Mr. Darwin says they are. Most of our new varieties of wheat seem to have been first discovered in other wheat fields and have been selected and propagated by their owners. Thus Fultz was found by Mr. Abram Fultz of Pennsylvania, twenty years ago, his attention being attracted to it from the fact that a few stalks of this still remained upright, while the wheat about them was badly lodged. Are such wheats introduced from other countries where they may be well known; are they the result of crosses effected by insects or the wind, or are they variations due to causes of which we know nothing? Our own investigations thus far lead us to believe that the wheat ovule is in *every case* fertilized by its own pollen before the stamens appear outside of the sheaths or pales. In fact, in many cases, it will be found that the base of the kernel has begun to grow before the "wheat is in flower." We have not as yet found any pollen upon the stamens *after* they have appeared, which then seem shriveled and dead.

To effect crosses it is necessary to open the pales and remove the three anthers while yet they are green. Other and riper stamens may then be inserted or they may be inserted later as the operator prefers. In the latter case, however, the trouble of the operation is nearly doubled. After the pales have once been separated, if ever so carefully, they afterwards remain slightly separated so that the pollen dust from other flowers might easily find its way to the stigmas which are very ready to accept foreign pollen. It is therefore necessary in order to *insure* a cross to bind the spikelets together with worsted or other soft material. In one of our experiments we removed the stamens (while quite green) of each *outside* flower of a head, not applying any other pollen or inserting other anthers, and not binding the spikelets so as to hold them together. The ovaries were fertilized all the same and the grain is at present as far advanced as in others which were not operated upon. Some of our friends who seem to have met with success in crossing wheats have written us that they cut off the anthers as soon as they appear and then apply the pollen with which it is desired to make a cross to the stigmas. Our own observations would show that crosses have *never* been effected in that way.

"HANDLING."

IN speaking of the quality of stock, and especially of that of "beef" cattle, there is scarcely any expression that is used more frequently than "handling," or "touch," and there is none the signification of which it is harder to explain. By "handling" the butcher can tell, before purchasing, the quality of the flesh of a living beast; and by it the breeder can ascertain the aptitude to fatten, the constitutional vigor, and the quality and quantity of the flesh an animal can carry. It is the peculiar sensation of softness and elasticity under the pressure of the fingers on different parts of the body. The nature of this sensation depends on the degree of perfection of the capillary circulation of the system, by which the nutriment prepared by the digestive organs is freely conveyed to every part of the organization. If the capillary circulation is actively carried on in the skin, at the greatest distance from the large circulatory vessels, it can readily be inferred that the internal parts, which are more favorably situated, will be abundantly supplied with materials for the renovation and increase of their tissues.

In testing by "touch" the first thing to be observed is the hair. A fine, long, mossy coat indicates a good feeder, whose flesh will be fine-grained and marbled. A fine but short coat shows a tendency to the accumulation of too much internal fat, instead of a uniform distribution of it through the system. Harsh, coarse, wiry hair denotes poor feeding capacity and late maturity. A soft, mellow, elastic skin, moderately thick, that yields readily under pressure when the animal is in moderate condition, but grows firmer as the beast "ripens," indicates good health, early maturity, and a fine quality of flesh that can be rapidly laid on. A hard, harsh, unyielding skin denotes a slow feeder and inferior flesh; while a thin, flabby skin portends a feeble constitution, coarse, stringy flesh, and soft, oily fat. In all cases the skin should be elastic—springy; the indentations made by pressure should be effaced promptly, not sluggishly, as are those made by pressing the fingers on a dropsical limb. To discriminate correctly by this method requires a delicate sense of touch that can be acquired only by a great deal of practice, and where there are differences in the condition of the hair and skin frequent comparisons of different animals are needed to avoid mistakes. By examination of his own stock, however, any farmer could acquire a good deal of useful information with regard to the "handling" qualities of animals.

HAVE WE FOOT-AND-MOUTH DISEASE AMONG US?

ON June 2nd a Glasgow cablegram announced the discovery of foot-and-mouth disease among the cattle landed from the steamer Phœnician, from Boston on May 21. On April 28 it was also wired from Liverpool that the disease had been found among the cattle on the steamer Lake Manitoba, from Portland, Maine, to Birkenhead, England, but afterward this report was contradicted. The English papers likewise tell us that on two other occasions since the opening of the year the malady has appeared among American cattle on their arrival in England. Much as we desire to be able to do so, we can hardly consider all these reports as unfounded as that of April 28. But, conceding that the disease has actually appeared in its distinctive form among cattle from this side of the Atlantic after their arrival at the other side, is this conclusive of the existence of the disease in this country? We think not, despite the rash report of its existence here officially made by Prof. Lyman to the Government last January; for if it existed in any part of the land, there would certainly be such a panic among stock owners there as prevailed in some portions of New York and New England during 1870-'71. In 1870 the disease was imported, with a couple of Short-horn cows, into Canada, near Montreal, and thence it spread rapidly through some parts of New York, Connecticut and Massachusetts, whither infected animals had been transported. Fortunately the outbreak occurred in the Winter, when stock was generally confined at the homestead, and before it could spread further after they were set at liberty in Spring, it had spent itself for lack of fresh victims.

So easily does it spread, not only among cattle, but among all ruminating animals and pigs, by means of contact with affected animals or with any person or solid substance that has touched them, that if it existed in the East it must have rapidly invaded the West, while if it prevailed in the West, it would have been impossible for the East to escape, in view of the great number of cattle constantly passing from the prairie regions to the seaboard. The rapidity with which it spreads is well illustrated by the present outbreak in England, the evils of which are so graphically depicted elsewhere by Prof. Sheldon. On September 20th last, 30 badly diseased cattle were landed at Deptford from Havre. Within five days, although French cattle are slaughtered at the port of debarkation, the disease had appeared in the counties of Essex, Hampshire and Middlesex, and, despite the most stringent precautions, it has since traveled nearly all over the Kingdom. Yet, without any precaution here, or any perception of a cause for it, we do not expect an affirmative answer to the above question from any part of the country. It is therefore highly probable that the disease was contracted on board the ship, either from hogs, beeves or sheep carried as "ship stores," or from stalls contaminated by these or by infected stock previously imported into this country, or from infected fodder, or even at the "foreign animals' wharf" in Great Britain, where the disease would become manifest 24 to 48 hours after the reception of the virus.

BREVITIES.

DID the modern "rage" for ornamenting the walls of our houses with decorated china take its rise in the artistic cow stables of Friesland?

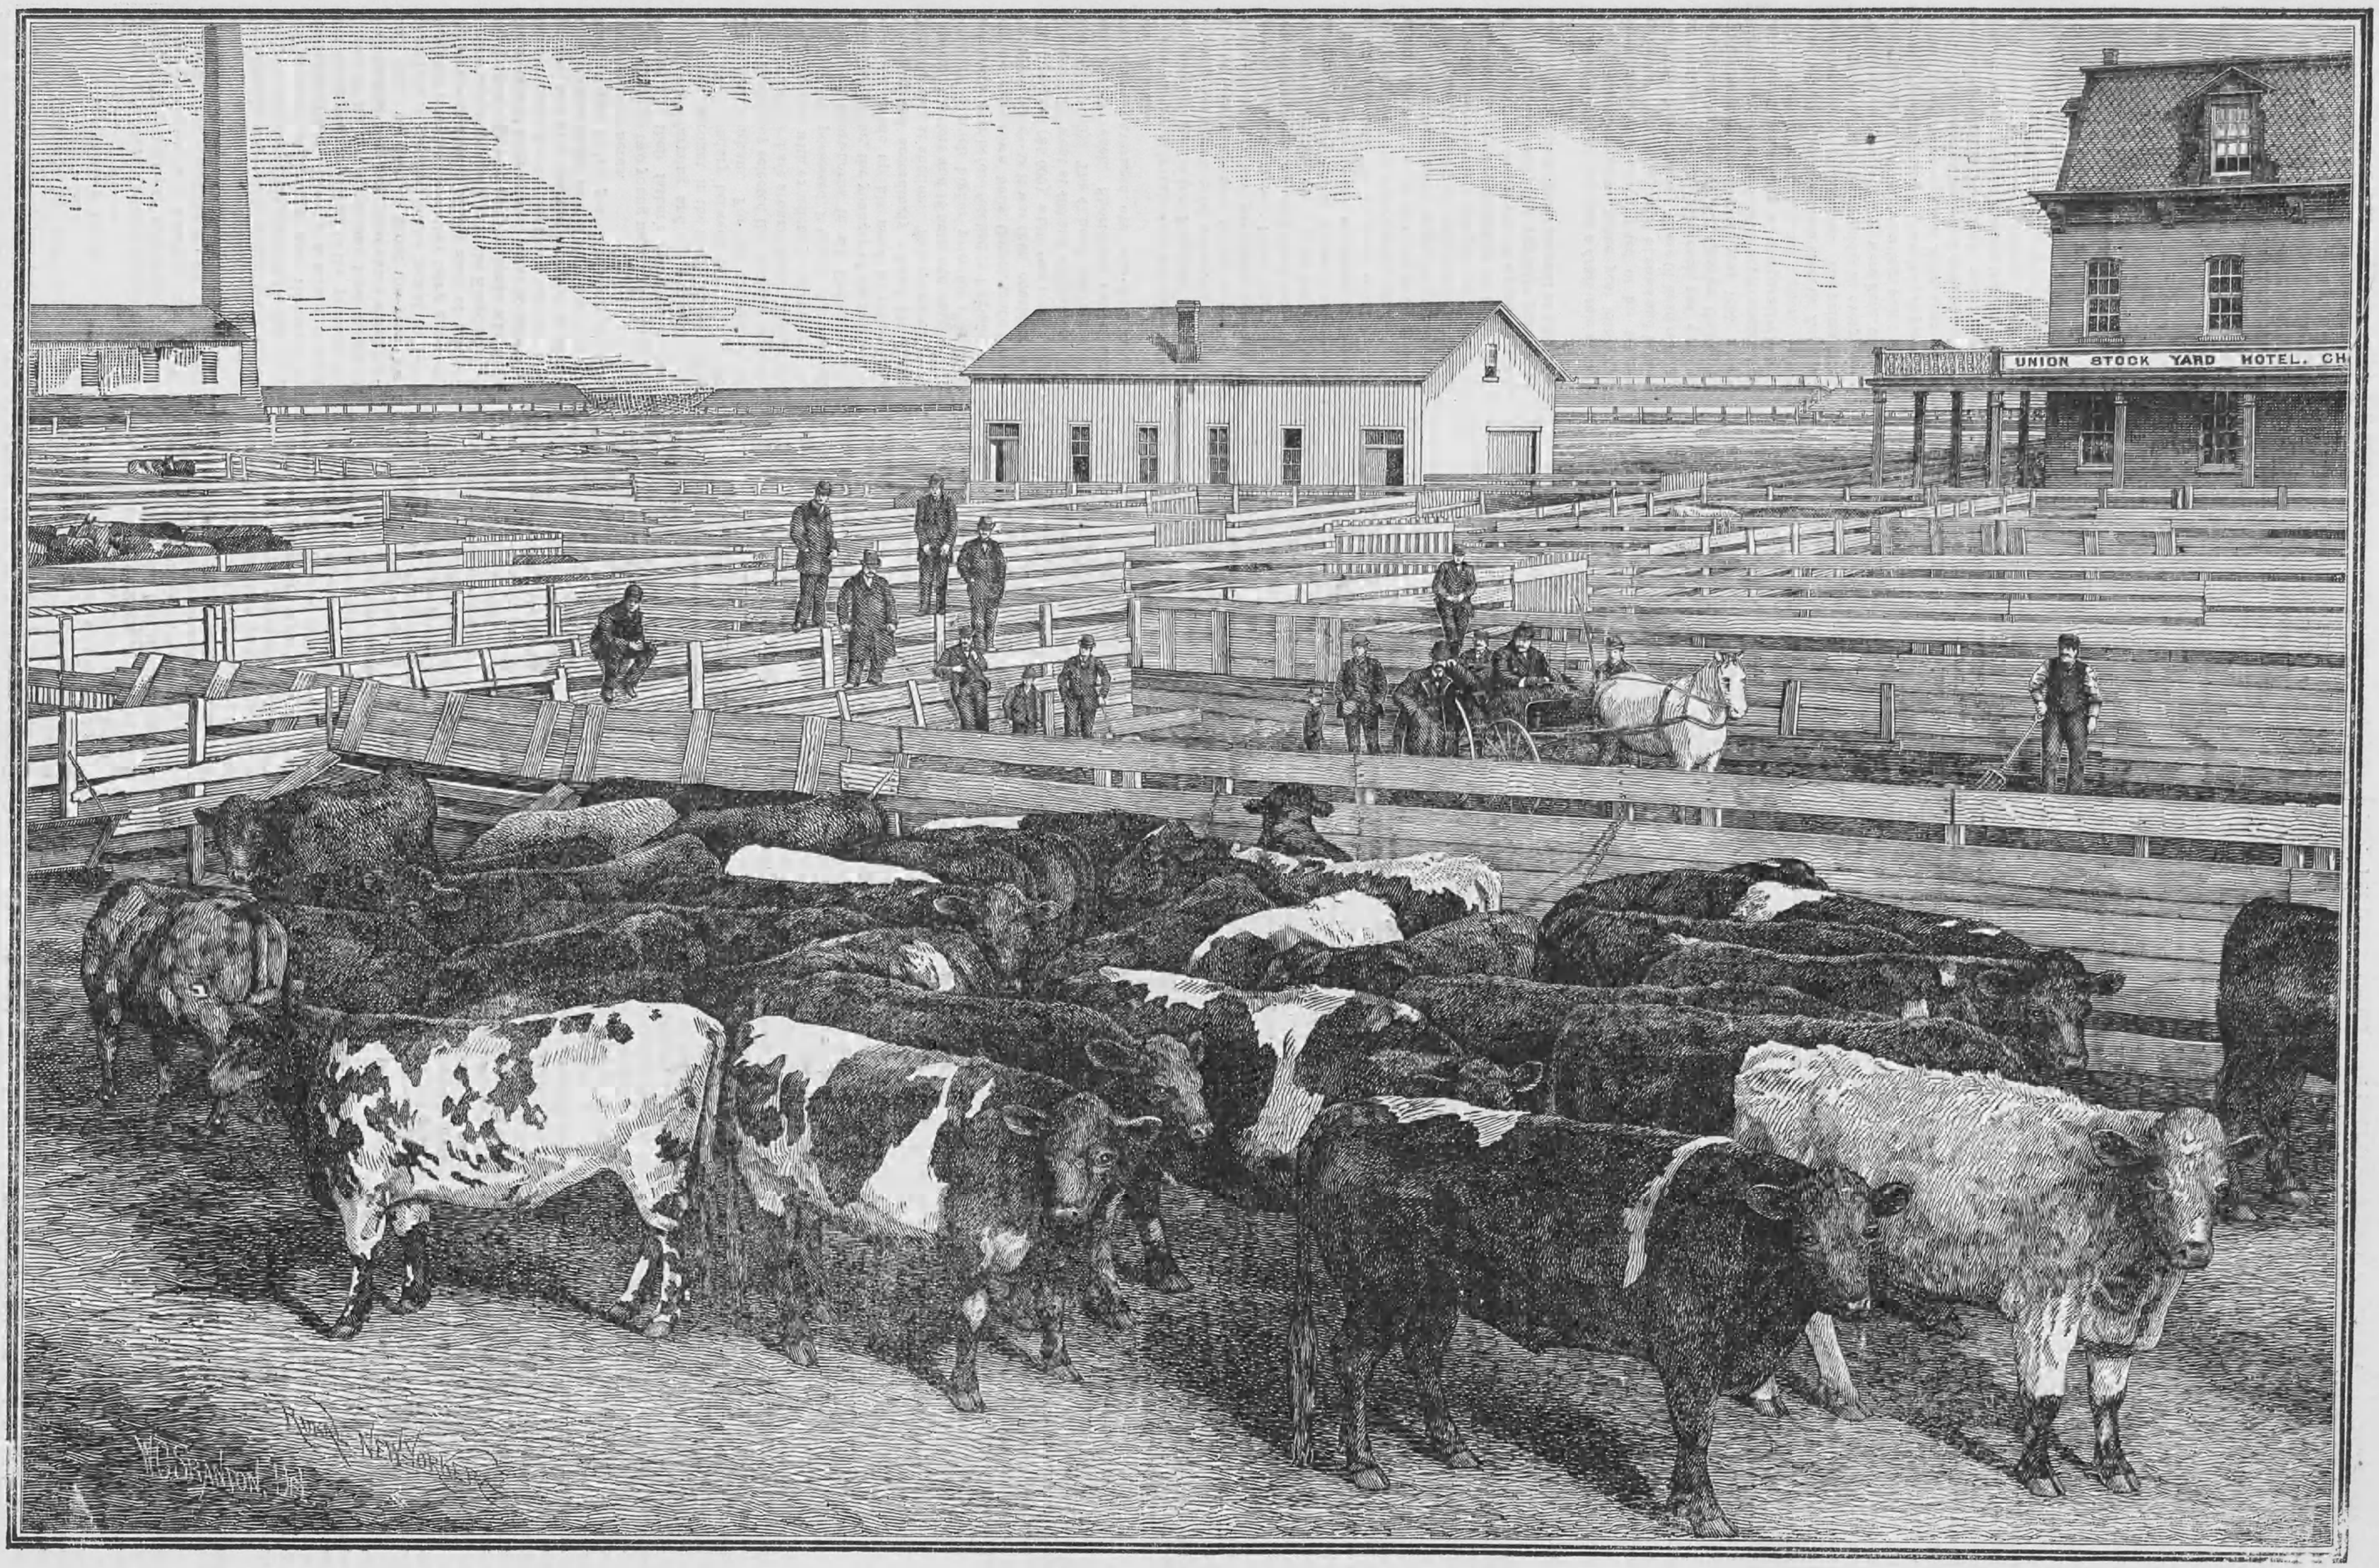
HAVING lately given to our readers several excellent likenesses of choice Short-horns, we have omitted to give one here for the sake of saving space.

EDS. RURAL: Your valuable gift—a Charter Oak Reversible Steel Plow—for three heaviest mangels raised by me, is received. You must have known what I needed. Please accept thanks. G. E. WARNER.
Jamesport, N. Y.

Now that more accurate information of the condition of cattle on the plains is afforded by the annual "round-ups," the losses from the severity of last Winter are reported to be considerably below the earlier estimates.

A WASHINGTON paper says General Le Duc's sorghum sugar cost the Government between $20 and $30 per pound and was sold by a local grocer at five cents per pound. Even if the statement were not grossly exaggerated, what useful discovery has ever been perfected without loss in preliminary experiments? Moreover, the machinery, buildings, etc., which consumed much of the outlay in this connection, remain for future use.

A CABLEGRAM from Liverpool on the 2nd inst. announces that Messrs. Gudgell & Simpson, of Missouri, have selected from the vast herds in England and Scotland 99 Hereford and 39 Polled Angus cattle, to be shipped on the 4th inst. by the Dominion Line steamer Mississippi, for Quebec. This is one of the largest shipments ever made from England, and it is to be hoped due precautions will be taken that the imported animals shall not introduce foot-and-mouth disease or any other contagious malady among our herds. To this end not only should a strict quarantine be enforced here, but the herds into which imported animals have been taken should be kept under surveillance for some time thereafter. The voyage from Great Britain to Australia is considerably longer than that to this country, yet Australia has established a strict quarantine of at least 90 days against English cattle, and, moreover, it has stipulated that such stock shall be guaranteed to have been free from all sources of infection for 60 days prior to shipment, and that they shall be removed from the farm to the vessel in horse-boxes and cattle-floats to prevent all risk of contagion in transit. Yet more, it is also provided that all animals taken on board as "ship stores" shall be carefully inspected and pronounced free from all disease. It would be well for our vast cattle interests if similar precautions were taken with regard to all stock imported from countries in which contagious diseases prevail.



POLLED "ANGUS-DURHAM" STEERS.

(Herdsman, continued from page 387.)

SHORT-HORN CATTLE.

LEWIS F. ALLEN.

It is not positively known whence the originals of this magnificent race came; but it is now pretty generally admitted that large, coarse animals, something like the Short-horns of the present day, were brought over from the opposite districts of the continent to England, by the Danes, after their conquest and settlement of that part of the island stretching from the counties of Lincoln and Yorkshire to Northumberland. Here, in a milder climate and richer pastures, added to the probable selection of the best specimens from the herds for breeding purposes, these cattle were gradually improved down to about the year 1700, chiefly, it is thought, by the monks at their monastic establishments, they being generally the most enlightened of any class of agriculturists and stock breeders in the Kingdom. At this period noblemen and gentlemen who were the owners of large estates, began to pay more attention than heretofore to agriculture as a science, and with this was included, as a matter of course, better care of their domestic animals, so that by the year 1780 many of them possessed fine herds.

At this time two young men by the name of Colling, left their father's establishment and commenced farming and stock-breeding on their own account in the fertile valley of the Tees, the boundary between the counties of York and Durham. For the foundation of their herds they selected the choicest animals they could purchase around them. These they bred together with excellent judgment, and by the year 1810 possessed, it is said, the two best herds of Short-horns in all England. Mr. Charles Colling, the younger of the two brothers, then made up his mind to retire from breeding, and accordingly offered his entire herd for sale at auction. This consisted of 29 cows and heifers and 18 bulls and calves. He obtained a much higher price for these than any cattle ever before fetched in England. One of the full-grown bulls, Comet, made the astounding price—as it was then considered—of 1,000 guineas ($5,000), while two cows, Countess and Lily, went at 400 and 410 guineas ($2,000 and $2,050). The 47 head realized an average of $700 each. Short-horn cattle before this scarcely averaged over one-third to one-half as much.

Reports of this sale were widely published throughout the United Kingdom, and consequently had the effect of attracting the attention of many cattle men to the merits of the Short-horns, who had previously known little or nothing about them. From this time forward they began to spread much more rapidly than ever before, not only in England, Scotland and Ireland, but in exports of them to the British colonies, to the continent of Europe, and to America. In all these countries they have bred well and numerously, taking precedence over every other race; not so much, however, from their more magnificent presence, fine, harmonious shape, and beautiful variety of color, as from their being found more generally useful for a combination of economy in rearing, and the production of a superior quality of beef and milk, and a greater quantity of these in proportion to the amount of food consumed.

Mr. Robert Colling had a draft sale at auction of his Short-horns in the year 1818, eight years after that above noted of his brother Charles. This consisted of 81 cows and heifers and 10 bulls and calves. These 91 head realized an average of about $620 each, not quite so much as the sale of Mr. Charles Colling in 1810. Between this and the year 1853, Short-horns fluctuated considerably in price wherever bred, sometimes selling at comparatively low figures, and again rising much higher. In the year 1853 they took a fresh start in England, and this reacted in America. The prices of all of superior quality rose rapidly in every quarter of the world where they were kept, till they finally reached their culminating point at the great public sale of Mr. Campbell, September, 1873, on his farm at York Mills, near Utica, N. Y. Here several bulls and cows of his herd, bred in the State of New York, out of importations from the famous Duchess tribe of the late Mr. Thomas Bates, of England, fetched the enormous sums of $5,000 to $30,000 each.

As near as I have been able to ascertain, a few Short-horn cattle were imported into the United States in the year 1785, followed sparsely by others down to 1817. From that time considerable importations have been continually made down to the present year. These have taken precedence over every other breed, and are now spread from Canada on the north, to Mexico on the south, and from the borders of the Atlantic Ocean on the east, to those of the Pacific on the west. The choicest of these cattle are recorded, with full-length pedigrees, in the American Short-horn Herd Book, the 20th volume of which has just been published. This brings the number of bulls up to 41,426, and that of cows to over 50,000. A large number of these animals have not been offered by their owners for record, which omission lessens their value considerably in public estimation. These may be equally well bred as those found in the Herd Book; but purchasers usually want something tangible to show that this is the fact, and they can only know it from the published record.

Short-horn cattle are the most beautiful and grand of all the bovine species. Although of the largest size, they are exceedingly fine and symmetrical in all their points; are hardy, thrifty, quick feeders, the best of handlers, and mature earlier than any other breed. Properly fed from birth, bullocks attain nearly to full growth at two and a-half to four years of age, and then weigh, when well fattened, from 1,800 to 2,200 pounds. The cows are proportionally large, and those bred from milking families excel in the dairy. When dried off and turned out to feed, they fatten rapidly. The quality of the beef of both is of high class. The colors of Short-horns are very handsome, varying from pure white to a light or full, rich roan, patched red-and-white, and a pure red. The skin is bright yellow; the nose orange or clear nut-brown. A golden rim encircles the eye, which is brilliant and usually somewhat prominent. The horns are quite short, and turn down or slightly up from the head. The hair is soft, with a thick coat of fine fur underlying it from October on to May, or even June.

Buffalo, N. Y.

ERRORS IN BREEDING.

D. E. SALMON, D. V. M.

Erroneous opinions are the greatest obstructions to progress in all callings; they are handed down from generation to generation and are accepted with an unquestioning and simple faith which it seems difficult to obtain for that which is really worthy of belief. It is an age of investigation, however, and intelligent people are rapidly freeing themselves from these shackles of the dead past. In agriculture, unfortunately, the masses have not had the benefit of that liberal education which is expected in the so-called learned professions, and which gives broader, more liberal and intelligent views; and, hence, the farmer is still weighted down with an incubus of false opinions that frequently prevent success where it might be easily attained.

It is particularly in the management of live stock, that the better class of the farmers of to-day are allured by false lights which should have been laid away with the past generation. Such men no longer wait for a certain phase of the moon before planting their crops or building their fences, as they did but a few years ago, but many of them still maintain that wheat and oats under certain conditions will change into an entirely different species of plant (chess); and when it comes to their stock, they will burn the mouth for lampas, knock out wolf teeth for blindness, and talk about hollow-horn and wolf-in-the-tail in a way that almost makes one imagine himself back somewhere towards the middle of the seventeenth century.

The subject of breeding is still under a cloud equal to that obscuring any other department, and, what is worse, the greater part of our public teachers seem to be rather more befogged than many of the practical breeders who read their articles; and thus all are deprived of the many advantages which follow from a thorough knowledge of the underlying principles—even the fearless innovator and bold experimenter, though occasionally reaching brilliant results, is more often discouraged by disastrous failures which he cannot foresee.

We have all heard that "like produces like," and most of us have given instant assent to it as though it were an axiom too plain to be disputed; but how few have imagined all that follows from this short statement of a great law of nature; how few realize that it is the sum and substance of the whole science of breeding; how few carry it with them in their practical work.

The first violation of this law is in the mating of unlike parents. Of course, there are cases where, the produce not being intended for breeding purposes, this is justifiable, as in the production of mules and beef cattle. But where animals of a high type are desired with a considerable degree of certainty, either running or trotting horses, milch cows, beef cattle, swine or sheep, above all when the intention is to establish a family or breed, the parents must be alike. If they are not alike, then the offspring cannot be uniform, since they may resemble either parent, occupy any position between the two or be totally different from either.

The parents, the grand-parents, the great-grand-parents, and so on, contribute each a part of the force which molds the forms and aptitudes of the new being. As a rule, the force derived from the parents is strongest and and prevails, but where these are unlike, there is an antagonism which frequently neutralizes both and allows the influence derived from a grand-parent or more remote ancestor to become predominant. This constitutes the so-called atavism or breeding back, in regard to which many have seen so much mystery, but which in reality is simply the law of heredity extended a few generations backwards by the counteracting tendencies of the direct parents.

The likeness referred to in the law of heredity is essentially one of forces and tendencies rather than of form and appearance: in other words, it is physiological, not anatomical. To be sure, animals which are alike in this sense nearly always resemble each other in form and color, but the reverse does not hold true; for many animals which have external resemblances are found to be antagonistic when bred together.

Before a new breed can be established, therefore, or an old one improved with any certainty, it is necessary to adopt a practice that will enable us to mate animals having harmonious tendencies, and which will consequently produce a uniform offspring. It is here that the majority of breeders have failed, for such harmonious animals can only be obtained from the same well-established and uniform breed, or from closely related individuals, and our agricultural literature is so filled with warnings against the disastrous result of *in-breeding* that only the few have had the courage to adopt it. And though the majority of these few have failed because of accidents which their ignorance of the principles of breeding did not allow them to foresee, a comparatively small number have succeeded by their wonderful powers of observation and an intuitive skill in management, and have given us the most valuable breeds that we have.

And, yet, after numerous examples of the most incestuous breeding carried on for 20, 30, or 40 years and followed by half a century or more of in-breeding, in which time the finest animals that ever lived were produced, and breeds hitherto unequaled have been formed, we must still listen to a chorus of croakers who insist that there is a mysterious influence about in-breeding which inevitably destroys form and size and renders the produce sterile and diseased. It is time for us to understand, however, that this is nonsense, that in-breeding of itself simply harmonizes the hereditary forces and enables the parents to transmit their characteristics unchanged to their offspring; and that crossing instead of adding to the size and vital forces of the produce by an equally mysterious power, only mates antagonistic parents and opens the door to variations for the reasons already given.

But, it is urged, the majority do fail in their attempts to improve animals by in-breeding. There is no doubt of it. The cause is not difficult to find, however—these men have a faith in a miraculous power connected with this method, which is to change the scrub into the thoroughbred as the philosopher's stone was to change the common metals into gold. There is as little foundation for a belief in a power that improves as there is for one in a power that destroys. In-breeding does neither. Its only effect is on the transmission of the characters of the parents—if these are healthy, well-formed and robust their offspring will be similar; if they are rough, lacking in vitality or diseased we may depend upon their transmitting these qualities with the same certainty as the more desirable ones. Parents transmit by inheritance that which they possess, and in-and-in breeding under no circumstances can enable them to do differently, either in respect to good qualities or bad ones, health or disease.

There seems to be a great law of nature that it is not good for the higher orders of plants or animals to remain for too many generations in exactly the same place, exposed to the climatic conditions, living upon the same character of soil, taking food from the same lands. Wheat under such conditions "runs out"—in other words, it loses in vitality, but its best qualities may be restored by taking it to a distance and growing it for for a few generations on a different soil. That is, it is not the so-called self-fertilization or in-breeding that is destroying it, but it is the sameness of the conditions of life.

This principle has been quite generally overlooked by breeders, but its effects have caused many of the failures that have been attributed to in-breeding, as well as most of the improvements credited to crossing. The success of Mr. Booth, who bred so closely and for so many years, is attributed to his breeding from bulls which had been for years a long distance from home on hire, and thus had the fullest benefit of changed conditions of life. Such animals are not "differentiated," as Mr. Darwin and others would have us believe—their forms and tendencies are what inheritance, food and exercise have given them, but they have an increase of vital force the value of which cannot be overestimated.

Another class of failures has been due to fatty degeneration of essential organs and particularly those concerned in generation, causing ill-health and, in the latter case, sterility. But this is not the direct result of in-breeding. If we take animals that already have the fattening propensity carried to such an extent that the muscles are invaded, as with our best beef cattle and hogs, and keep them with little exercise and highly fed, we should expect their fattening tendency to increase and the organs of procreation to be finally destroyed, for this is an inevitable result. Of course, this occurs in a less number of generations with in-breeding because the tendencies of the parents are more surely transmitted.

What I wish to insist upon, then, is that in-breeding and selection are methods by which we insure the transmission of the characters of one generation to that which follows—they originate nothing; improved or degenerated forms, health or disease, good or bad temperaments, fertility or sterility result from other conditions of life. And this is as true of one species of animals as of another; in-breeding the thoroughbred horse, when intelligently practiced, has reproduced the best animals with the same certainty as it has with thoroughbred cattle; and if the breeders of the American trotter expect to transmit with any certainty the improvements which the careful management of a generation of these animals originates, their hopes can only be realized by the adoption of this method. It is absurd to claim, as some are doing, that in-breeding is fatal to horse flesh because it diminishes the bone; it has no such effect, and as a method of breeding it is as valuable with horses as with any other species of animal. When the principles of inheritance and the effects of the conditions of life are clearly understood by the breeder, his greatest difficulties will be surmounted, and the disastrous effects supposed to be inevitable to in-breeding will be as readily averted.

WORKING CATTLE.

A. B ALLEN.

"With patient, unremitting toil,
We break the clod of every soil:
Our harness cheap, no grain we eat,
And want no shoes upon our feet."

Thus sings the poet, and it is literally true with oxen employed in the general work of the farm, as grass alone suffices for their support in Summer and hay in Winter. But if used for lumbering in the forest, or steady teaming on hard roads, they must then have a moderate allowance of grain, in addition to grass or hay, and be well shod.

The wise king of Israel tells us, that "much increase is by the strength of the ox." The farmers of our Northern and Eastern States seem to have fully adopted this opinion; for ever since the settlement of the country, they have employed oxen much more generally for plowing, carting, etc., than horses, and why those at the West have not done the same I am at a loss to imagine. The only reason I ever heard them give for using horses in tillage rather than oxen was, that the former were quicker in their movements than the latter. This depends, however, entirely on their breeding. The red grade Devon cattle of New England, have as fast a walk as a smart horse, and are easily trained to trot five to six miles within the hour; while those of a larger size and greater power, like the grade Short-horn and Hereford, are quite equal in pace to the ordinary draft horse.

Oxen may be preferred to horses for general farm work, for the following reasons:

First. It does not cost so much to breed and rear them.

Second. They can be put to work when two years old, which is not safely done with any except the largest and most powerful class of horses.

Third. Their harness being simply a wooden yoke and a couple of bows, it does not cost over one-fourth to one-fifth as much as that of a pair of horses.

Fourth. When a load is so heavy as to require a considerable number of animals to draw it, ox teams are especially requisite for this purpose. They can be started up gradually, and each pair will continue to pull steadily till all have put forth their strength, and the load then moves off. Not so with horses. Unless the dullest and slowest of their kind, the pairs start separately or at most two at a time. These, not being able to draw the load, stop pulling, fall back, and thus continue to balk each other, often rendering it impossible to get away with the thing to which they are attached, when they must be taken off, and oxen hitched on in their place to perform the task.

Fifth. If an accident happens to an ox which unfits him for further work, such as getting a foot crushed by a heavy log or rock rolling on it, or a leg broken by stepping into a hole, or something else which will occasionally happen, he can be immediately slaughtered and will bring a fair price for beef. Not so with the horse, he becomes a total loss, save his hide.

Sixth. Cattle are hardier than horses; do not require so much attention; have no vicious or destructive habits, and are not nearly so subject to diseases of various kinds.

Seventh. Flies and mosquitos are not so tormenting to them, and, except in places when such are extra troublesome, netting or sheeting is not necessary to protect their bodies from these pests.

Eighth. Cattle manure is much more valuable than that of horses for light lands. This keeps cool and moist in a drought, and continues to add nutriment to the growing crops, whereas that of the latter dries up, heats and burns the soil.

Ninth. The ox may be kept on steadily at work till seven to nine years old, or even later, and when turned out then to fatten for a few months, he makes an excellent carcass of beef, which sells for a good price. Horse meat is not in vogue quite yet among us, and the horse is consequently disposed of as worthless when done with as a worker.

The ox, both living and dead, is distinguished by the farmer from all other animals, for he alone combines the most useful labor with the best of meat. There is nothing more pleasing to the lover of domestic animals than the sight of well bred oxen, whether standing quietly in their stalls, browsing in a pasture, or yoked to the plow or cart. How patient and enduring in their toil, and how strong and grandly they move along, looking forth with placid, honest eyes, gently swaying their noble heads, crowned with broad-spreading, lofty horns! Tip these with bright brass knobs, and they add a finish and beauty to the team still more to be admired. The cost of these balls is trifling, and it takes but a few minutes to screw them to the horn—by all means then let them be thus adorned.

THE CATTLE INTEREST.

Feeding for Profit.

CONRAD WILSON.

There are probably but few of our farmers, and still fewer of other classes that realize the total aggregate value of the cattle interest of this country. A brief glance at a few leading facts can hardly fail to be of interest, and may tend to promote a truer appreciation of this immense industry. Taking the whole number that are now annually slaughtered for beef, at twelve millions, with an average weight of 800 pounds per head, it shows an aggregate of nearly ten thousand million pounds, worth from five to six hundred million dollars.

If we take the whole number of cows at thirteen millions, the yearly product, either in milk or butter, would be in money value over seven hundred million dollars; or by comparing the nutritive quality of the milk with that of boneless beef, the intrinsic food value would be nearly a thousand million dollars. But there is in the manure another value which is too often overlooked, and the annual amount of which (if it were carefully kept, and rightly used by all farmers), would amount to over three hundred million dollars for the steers, and an equal sum for the cows.

Now, it is true enough that this splendid heritage of manure is not all realized by our farmers. But that is the fault of the owners, and not of the cattle. This value, and even more, is all within their reach, and whatever they fail to secure is due to their own indifference and neglect. The following statement shows the footing up of this annual value.

Yearly value of slaughtered cattle	$800,000,000
" " dairy product	1,000,000,000
Total value of manure from both the above	600,000,000
	$2,100,000,000
Less for cost of labor and feed, say	900,000,000
Net annual income	$1,200,000,000

Cost of Feeding for Beef.

From some experiments recently cited in this journal, as reported by Prof. Sanborn, Prof. Cook, and Prof. E. W. Stewart, I showed that the cost of production for beef, in the cases cited, was less than four cents a pound, and the cost for butter not over six cents. These were, of course, exceptional cases, and better than the present average of actual results. Yet there is no good reason why ordinary farmers may not come very nearly up to this standard, nor any sufficient excuse, for their failing to make the effort. The following facts and figures may perhaps help to guide the earnest, progressive farmer in this direction.

In the journal of the Bath and west of England Agricultural Society, a table is given, in which it appears that 12 pounds of clover hay are equivalent in feeding to one pound of beef; also that eight pounds of beans or peas, or six pounds of barley, or oil-cake (either rape, linseed or cotton-seed), will give the same result; and, further, that four and a-half pounds of ground peas and linseed cake combined, will produce a pound of beef.

According to the late Alderman Mechi, seven pounds of grain (as an average for the leading cereals), will produce one pound of beef, net butchers' weight.

In an experiment of G. H. Chase, of Western New York, it was found that 28 quarts of ground barley per week gave an increase of 18 pounds of flesh.

The editor of the Rural Annual, commenting on some experiments of Dr. Lawes, concludes that one bushel of corn, with 100 pounds of good hay, will produce 10 pounds of beef in a week.

In another case Dr. Lawes cites from an experiment of Biddell, a feeding ration for beef—comprising oil meal, wheat meal, cotton seed, mangels and straw, costing about $7 for four weeks, and equivalent to 60 pounds gain of flesh, plus one ton of short dung.

In the Farmers' Gazette it is stated that a daily ration of 3½ pounds of bean meal and oil meal, in equal parts, added to cut straw will produce a pound of beef.

At the Willoughby Farmers' Club, in Ohio, Mr. Moore reported a result showing that steers fed with corn meal combined with cut stover and cut straw, gained two pounds a day at a cost of six cents for the beef.

Now it is not claimed that the feeding materials in these cases are all of them of peculiar value, nor that any of the rations, so far as they are defined, are specially remarkable, but the point intended here, is the instructive fact that in each case, if the manurial value is duly credited, the cost of the beef is less than four cents a pound, and in several cases less than three cents.

STOCK RAISING IN TEXAS.

PROFESSOR C. C GEORGESON.

Texas enjoys unrivaled facilities for stock raising, and she has long been famous among her sister States for this industry, more perhaps, for the quantity than for the quality of the live stock she produces. To fully comprehend the advantages which this State offers in that respect one must have some idea of its area and the character of the country. Texas contains 274,357 square miles, an area equal to all of the New England States, New York, Pennsylvania, Ohio, Indiana and the lower peninsula of Michigan. Although cattle are raised in all parts of the State, the stock country proper lies chiefly between the Colorado and Rio Grande Rivers, and extends from the Gulf northward to the Indian Territory, embracing more than 150,000 square miles. Nowhere else in the Union can a tract of this extent be found which is so peculiarly suited for grazing. It is usually estimated that one league, or 4,428 acres, will pasture a thousand head of cattle, and according to this estimate the region referred to will be more than sufficient to support fifteen million head. But room is not the only advantage the Texas ranchman enjoys. The mildness of the climate is such that the cattle can remain unsheltered on the prairies the year round, and while the grazier of the older settled parts of the northern territories must shelter his stock for a long period of the year and feed them at a heavy expense, or remove them altogether from the Summer pastures, the stockman of Texas need take no trouble with his. Even during the past severe Winter, which has been so disastrous to the herds of the Western plains, the cattle in Texas suffered but little, and stockmen here are now filling out the herds which in Nebraska, Colorado and elsewhere have been thinned by hunger and cold. The face of the country consists mostly of rolling prairies which in the northwest rise into several groups of sand-hills and low mountains. The rainfall is very small, but there is water enough for stock. Bordering the creeks are narrow strips of woodland. The principal fodder plant is a low-growing, nourishing grass commonly called the Mesquit, (See last week's Rural New-Yorker, p. 366) somewhat similar in appearance to Bermuda Grass. It is said to retain its nutritious qualities though it be parched brown by the sun. Such, briefly stated, are the extent and character of the stock country of Texas.

The Individual Wealth

of stock raisers is on a scale corresponding to the vast extent of territory. It is not uncommon for one man to own a range comprising 10 000 to 50 000 acres, and not a few ranges contain upwards of 100,000 acres. I am informed that Richard King, of Nueches County owns 250,000 acres, or over 390 square miles, in one tract of land, 200,000 acres of which are inclosed by a wire fence consisting of five wires and a board on top. Another gentleman, Capt. M. Kennedy, of Corpus Christi, has 150,000 acres under fence. This fence, with the buildings and improvements for herdsmen, is said to have cost $100,000. To Eastern landowners these figures will sound fabulous, but it must be remembered that no attempt whatever is made at the cultivation of crops. The annual increase of stock is generally put at 25 per cent. over and above all casualties. Stock raisers of this stamp frequently live in almost palatial dwellings and their children are educated in the best schools the nation can afford. There are others who own no land at all, but drive their herds from place to place over the wild prairies, wherever they find good pasturage and plenty of water, much as did the patriarchs of old. This is the case chiefly in the West where fencing has not yet been practiced. Still others rent pasturage at from one to three cents per acre annually. Land in the stock region can be purchased in tracts to suit the buyer at from 50 cents upwards per acre.

The Characteristics of Texas Cattle

are well known in cattle markets all over America. They are noted for their immense horns and rather small bodies, with a correspondingly small amount of beef. It is a hardy prolific and rather docile race, such as would naturally result from the conditions under which it has been bred. For beef cattle they are, however, too narrow through the quarters both in front and behind, the ribs are not sufficiently sprung, making the lack of width across the back very apparent, and they are very slow to mature. The wealthier stockmen are rapidly improving their herds by the introduction of thoroughbred males, mainly of the Short-horn and Devon breeds. For the production of milk the Jerseys have been introduced and they are at present in high repute. There can be no doubt of the wisdom of introducing these latter breeds. I venture the assertion that the value of a herd of natives for beef can be raised 50 to 60 per cent. in two crosses with thoroughbred Short-horn or Herefords. But the enterprise is connected with great risk and often severe losses when the animals are brought from districts where the cattle are susceptible of the disease commonly known as Texas cattle fever; for they will be almost certain to contract this disease and a very large percentage succumb to it. The surest way appears to be to introduce cows, recently got in calf, in the Fall. The disease will not break out in the cow till the following Summer, and the calf will, in the meantime, become so well acclimated, having been developed and born here, that it will either take the fever lightly or not at all.

The Modus-operand

of raising cattle in Texas is simple, and the expense in the business is next to nothing outside the hire of herders and the maintenance of fences, where these have been built. Every stock raiser adopts some brand, consisting generally of initial letters or a monogram, which is registered in the office of the county clerk, and with this every head in his herds is branded. To facilitate the branding, a strong inclosure, or pen, is built, called a corral. It may be circular or polygonal in shape, and it is often constructed of logs sunk into the ground close one to the other and reaching eight or ten feet in hight. It opens out to the prairie on one side, through a narrow passage called a "shoot," some five feet wide and of any desired length. The cattle to be branded are crowded into this "straight and narrow path," where, unable to turn or move, the heated irons are applied to their bodies. When all in the "shoot" are branded, the rails which close the passage in front are removed and the terrified creatures are again free on the prairie. On the unfenced ranches the cattle of a dozen or more stockmen may run together, the brand being the only evidence of ownership. In this case the ranchmen of a district meet together some time in the Spring before the calves are weaned, and brand all the the young stock, each calf being marked with the same brand as that on the cow it follows. This is called the annual "round-up." Sometimes they are driven into a corral, as above described, but they are as frequently lassoed as they run, thrown down and branded on the spot. The branding is a cruel operation, and the man who can invent a dye or paint which will be as irremovable as the brand, and as readily applied, will be a benefactor to the cattle of Texas. The tendency at the present, however, is to make the brand large and deep so that it can be distinguished at a distance.

The bulk of the cattle are sold in the Spring and early Summer. Prices for stock cattle are, on the ranch, $3 to $6 for yearlings; and $8 to $12 for two-year-olds; $12 to $15 for cows; and $14 to $18 for four-year-old steers. They are then either sold to drovers, or, when the owner has a large number, he may drive them to the market himself. Not more than 2,000 to 2,500 head can be conveniently driven in one body, and when on the trail it requires about one man for every 200 head to drive them. They are driven slowly and, of course, pick their living along the trail over which they pass. Arriving at the market in Kansas, Colorado or Nebraska, the herd is purchased by cattle buyers, who graze them from a few months to a couple of years, according to age and condition, and at the end of this period, they are shipped eastward to Chicago, Cincinnati, New York and other markets.

It sometimes happens that a whole drove gets frightened at night while on the trail, and a stampede ensues. This is the dread of the drover. An uncontrollable panic seizes the herd, and in wildest flight they run off in whatever direction they may happen to get started. Hardly anything short of a rampart can stand against them. The foremost are pressed on by those behind and if they fall they are trampled to death in an instant. The aim of the drovers in this emergency is gradually to turn the leaders of the stampede so as to make them move in a circle, when in due time they become exhausted.

Besides what are driven to Northern markets, thousands are annually slaughtered and packed in the several beef packeries here in the State, and large numbers are also exported to Havana and elsewhere from the seaports on the Gulf. The total number of cattle which yearly leave Texas for the support of the world is probably not much less than 300,000.

State Ag'l College, College Station, Texas.

POLLED CATTLE.

(See page 389 for Illustration.)

Of the several breeds that which we just now wish to consider is the Angus, or the Aberdeen, the peer of the Short-horn in the pasture and the stall and on the shambles. This breed, of which we give some excellent and interesting illustrations, originated in the Northeastern part of Scotland in a district of limited extent, extending from the Southern slopes of the Grampian hills to the rich lowlands of the Frith of Forth. It thus occupies a bold headland which projects out into the North Sea where the climate is harsh and rigorous. Consequently these Angus cattle are hardy and able to buffet the northeast storms and breezes which pour from the ocean over their exposed pastures. They are thus naturally suited to our Western pastures and better able than the more tender English races to resist the hardships of our rigorous Northern Winters. They are, nevertheless, excellent feeders, having been greatly improved for nearly a century by the most skillful and enthusiastic breeders, the first of whom—Mr. Hugh Watson, of Keillor—deserves the chief credit for their well deserved reputation. The bull Prince of the Realm aged 15 months, of which we recently gave a portrait, is a representative of a herd descended directly from Mr. Watson's cattle and bred by Mr. Ferguson of Kinnochtry in the county of Fife, which is the best part of the district above mentioned. As a proof of the merits of the Angus cattle, we may refer to the fact that at the last Exposition at Paris in 1877, these cattle took first premiums in competition with every other race of beeves, and that they have frequently taken the first place at the Smithfield fat cattle exhibitions in England. They have also been chosen by the most expert breeders for the purpose of crossing on the Short-horns. Several head of this cross, Angus-Durhams, were exhibited at Paris in 1877, when three four-year-olds weighed alive an average of 2,347 pounds, and dressed 1,633 pounds net.

It is an interesting fact that this same cross has been tried and made perfectly successful in Kansas. By the kindness of Mr. Thomas R Clark of Victoria, Ellis Co., Kansas, we are enabled to give a representation, copied from a photograph, of 36 head of Angus-Durham steers as they appeared in a pen at the Union Stock Yards at Chicago, a short time ago. These were bred by Mr. Clark at his ranch at Victoria, from pure Short-horn cows and a pure Angus bull. The Angus cattle at Victoria were imported a few years ago. They have thrived remarkably in their new home and have been used with great success in crossing upon the ungainly native Texan cows as well as on comely Short-horns. Mr. Clark's experiment, possibly made without a knowledge that it had been successfully carried out in Scotland many years ago, has terminated very favorably. He finds that the products of the cross are, with rare exceptions, all polled animals, and believes that the production of a native hornless cross breed, which will possess all the good points of both parents, can easily be founded. The lot of steers sold at Chicago were very favorably considered by the butchers. They were sold to a New York dealer who states that they made the best quality of beef and dressed equal to extra cattle, making 62 pounds dressed meat to the 100 pounds of live weight. The butchers, Messrs. Schwarzschild and Susberger, of New York, regarded the beef as very fine for the age and weight of the cattle, which were two years old and averaged 1,340 pounds live weight. This is an interesting result, and considering the desirable character of these polled cattle, it is to be hoped that Mr. Clark's example will be followed by others, and an effort made to popularize the hornless breeds. It should be noticed that these Angus-Durham steers bred by Mr. Clark, were grazed on the open prairies, which at Victoria, are the Eastern verge of the vast plains which stretch westward to the Rocky Mountains and northward to the Canadian boundary, and far beyond it, so that their growth and substance have not been produced by stall feeding or by means of rich food, or by the careful sheltering or luxurious pampering enjoyed by some of the cattle in the East. Besides, this locality is subject to the hardships and rigors of torrid Summer heats and severe Winter storms and colds, and these cattle necessarily have to go through all these equally with other stock that are kept on the plains. The experience of several years at Victoria has satisfactorily shown that the Polled Angus cattle thrive perfectly well in America and can take their share of the hard-

ships incident to Western ranching as well as the Texans which are "native and to the manner born."

This breed is becoming deservedly popular in America and several persons are importing herds at considerable prices. The Hon. H. M. Cochrane, of Hillhurst, Canada, has recently received five head from the herd of the Earl of Strathmore and five from that of Mr. Smith of Dundee, which cost from $500 to $800 per head. The model farm at Guelph, Ontario, is forming a herd; Mr. J. J. Rogers of Abingdon, Ill.; Mr. Campbell of Iowa; Messrs. Burleigh and Bodwill, of Fairfield Center, Maine; Hon. J. H. Pope, Minister of Agriculture, Canada; Mr. Redfield of Wigwam Farm, Batavia, N. Y., and some others, are also importing freely from the best herds in Scotland. A herd has been sent to the Sandwich Islands for a Scotch resident there. Mr. Clark is entitled to the credit of being the pioneer importer and breeder of these cattle in America, and the first to introduce them to the western country, as well as the first to cross them upon the Shorthorns and bring them to the test of the butchers' stall.

An inferior black polled race is known as the Galloway. This is named from a locality in Scotland and has come originally from the same stock But it is inferior to some extent, because it has not been subjected to the careful culture and training which the Angus cattle have had, and although it is a hardy race, yet it is coarse in form, rough-haired and by no means so profitable a feeder as the latter. In concluding these remarks, it might be suggested that a very promising venture is offered to some enterprising dairyman to cross some of the milking strains of these Angus cattle on our Jerseys, so as to produce a hornless dairy cow of the best quality, of graceful form and of perfect docility and harmlessness.

LIVE STOCK INTERESTS IN GREAT BRITAIN.

PROFESSOR J. P. SHELDON

The agricultural mind of this country is being a good deal exercised on the subject of contagious diseases of cattle. A long and disastrous period of depression has made our farmers unusually acute on the subject of losses which may be prevented, and of inconveniences which are gratuitous. It is, they think, enough in all conscience that fiscal depletion should come of causes which, in the present state of scientific remedies, are beyond control, without having also to bear losses the causes of which may be or might have been prevented. Knowing that we are ever liable to disease—scourges whose origin is in other countries, and which by proper regulations efficiently carried out may be kept there, increased vigilance is demanded and more drastic measures are proposed. The present condition of bovine interests in the country proves, indeed, ample reason for the feeling of insecurity, and its inevitable dissatisfaction. A "tight little island" like this, whose internal management is or ought to be well in hand, should be the last place on earth in which such a feeling should have any cause to gain ground, and it is clear that a joint is loose somewhere in the administrative harness. We have been thought hardly of in America from having ordered that the cattle she is good enough to send us at so cheap a rate shall be slaughtered at the port of landing, because she cannot present us with a clean bill of health among her live stock, and we have quietly let slip in the insidious disease of "foot-and-mouth" from a country which is comparatively within a stone's throw—from France, in fact.

This it is that is again promoting John Bull's proverbial love of grumbling, and it must be admitted that John Bull is quite in the right for once. It is true that we cannot produce enough for ourselves of the animal food on which the typical Englishman loves to dine, and that we are driven to import an annually increasing quantity of it from foreign countries and from our own dependencies, but it is clearly "a penny wise and pound foolish" policy to admit with that imported food certain diseases which, by diminishing our home production, makes us more than ever dependent on those outside countries. Our farmers do not clamor for anything in the shape of protection against the importation of foreign food of any kind, though they find a rapid increase of difficulty in meeting foreign competition with success; but they do most properly demand protection against the introduction of disease along with the food.

It has been estimated by competent authorities that we lose quite as much of our own stock through these imported diseases as the imported animal food amounts to, and that many millions sterling are sent out of the country to supply the deficiency of animal food which these very diseases have created Repeatedly and *ad nauseum* these diseases have invaded the country, working desolation and loss, ruining numbers of hard-working farmers and were it not that, as a class, our agriculturists, despite their grumbling tendencies, which probably have a climatic origin, are the most long-suffering people to be found, they would have risen up and demanded, once for all, in a manner admitting of no compromise, that their flocks and herds should be made safe against murderous epidemics from abroad. Repeatedly have we been compelled to stamp out these epidemics, and to adopt stringent regulations to confine them within a limited area, and patiently, even cheerfully, have our farmers submitted to the harrassing inconvenience and loss inseparable from such orders. All, as it appears, to no purpose, for again is the whole country declared to be infected; again are the markets closed; again is the movement of stock placed under strict supervision; again is bucolic commerce in a state of paralysis; again have values become a nebulous entity; again are our farmers reduced to the condition of a beleaguered city with an enemy at the gates.

These diseases mean ruin to the British farmer to an extent which is not well comprehended in other countries. Ordinary farm stock—cattle, sheep and pigs—are worth more in Britain than in any other country, and the farmer's capital is invested in them to a greater degree than we find elsewhere. He does not and cannot, as in America, for instance, own his farm and the stock upon it; land is too dear to admit of that; so that when diseases sweep away his stock nearly his all is gone. A farmer in England who is rich enough to own his farm as well as the necessary stock upon it, does not so easily "go to the wall" if he loses his stock, but the proportion of those who own their land is very small in comparison with those who rent it. From this it is evident that our farmers need to be guarded against the intrusion of diseases. Our authorities are well aware of this, hence the measures which are taken to prevent the introduction of foreign epidemics, and to stamp them out as well as to prevent the spread of them, if unluckily they do find their way in amongst us. Were our farmers land-owners, as American farmers are, it is possible that our Government would do no more than yours for the eradication of disease, but we cannot afford to be supine on the question. It does not appear to me that America had any right to complain when we ordered her live stock to be killed on landing here; and we should only have been reciprocal had we placed a heavy import duty on them as well. So soon as you have ridded your country of disease we shall again admit your live stock without restriction, but American farmers may depend upon it that America will remain scheduled until a clean bill of health can be presented.

But we have something amongst our live stock which is far worse than foot-and-mouth disease. Our sheep are dying in thousands from the parasitic disease of liver-rot. It is probable that we have lost four or five millions of them, either directly or indirectly, from this cause within the past 18 months. This is not an infectious disease in the ordinary meaning of the word, but it is none the less disastrous on that account. The sheep pick it up just as freely as if it were. The sequence of the wet seasons we have had is the cause of this frightful malady. Another of the series would be worse than any previous one, because the land is getting more and more impregnated with unsoundness. At the present time sheep are dying on land to which neither record nor tradition ascribes any previous liability to "rot." Land that never has required artificial draining, and has always been regarded as perfectly sound, is no longer regarded as perfectly safe. Even on the carboniferous limestone soils of Derbyshire, where liver-rot was never known before, there is probably not a perfectly sound flock to be found. The consequence is that while mutton is dear, store sheep are a drug in the market. Even on the dry soils of Leicestershire sheep are dying in thousands, though they withstood the disease until the past Winter. I hear of one man who has lost within a short period upwards of 60 per cent. of his ewes. In many heavy-land districts there are no sheep left. A man not far from me has lost two whole flocks; the first died off a year or two ago; he bought a second and that too is swept away. On the wettest land, in some parts, even cattle have become afflicted with rot. Sheep will be dearer than ever they were known to be, so soon as the malady has gone and confidence is restored. We want a couple of American Summers and Winters to purify the land—your clear, bright sky and your dry, pure air.

Meantime no one can pretend to have any certain knowledge of what live stock are worth at the present time in this country. The markets are closed *sine die*, and very little business is being done without them. A man cannot take his cows to drink on a public road without a permit from the police, even though they may have been drinking there for a century or two; nor can he move them from one part to another of his farm if he has to cross a road in so doing. If a man buys any cattle, sheep, or pigs, he must procure a special pass before he can move them away. All these things are very harrassing, but they are necessary to prevent the spread of the foot-and-mouth disease. In the Autumn of last year the trade in store stock showed a healthy revival, in comparison with the previous 12 or 18 months, but it has been checked by disease and its attendant restrictions. It is probable that better times were dawning on us but for this outbreak of foot-and-mouth and for the continued prevalence of rot among sheep. Meanwhile our horses and pigs remain healthy, but our people are beginning to imbibe a wholesome fear of *trichinosis*; our neighbors, the French, have started the crusade against American pork and bacon; it will be some time before confidence is restored.

Sheen, Ashhonrne, England.

GRADED ANIMALS AND THEIR ADVANTAGES.

COL F. D. CURTIS.

The merits of thoroughbred stock have been so often repeated that grades have necessarily stood in the background. There has been a sort of false pride in connection with them on account of their lower value when compared with animals with a full pedigree, which has lessened the interest in them. Breeders of the pure blood animals have helped to create this feeling and to keep it alive by vaunting the claims of the thoroughbreds and pushing them to the front rank, or the aristocratic line. This is right, perhaps, as this royal blood is certainly more costly and it is this which lays the foundation for the grades. By grades we mean the progeny of pure-bred stock crosses of the "natives." Herein the greatest benefits are to be derived from thoroughbreds. The latter command a price above the reach of ordinary farmers, and their owners justly demand more for them, on account of their cost to them and because they really are more valuable to produce stock. Few people realize how much real benefit may be derived from a judicious crossing of the pure-bred and the "native."

A mongrel sire of any kind of stock should never be used If a farmer is not able to purchase a thoroughbred alone, he should get others to unite with him and make a joint purchase, dividing purchase price and cost of keeping. When this is done no neighborhood need be without such a sire. The choice should be according to the wants of the community. If cheese-making is the leading dairy interest, then a breed of cattle should be selected which will furnish the largest yield of milk, and this selection should be governed by the circumstances of feed In most dairy districts the Ayrshires will be found to be best adapted to the purpose, on account of their smaller size and their ability to take care of themselves, and to furnish the largest yield of milk on shorter feed. Where the pastures are luxuriant and feed is abundant, the Holsteins will give satisfaction. These are the most valuable cheese-producing cattle. We know of crosses of the Ayrshires upon the natives which have demonstrated their value. These grades all made superior cows, and one of them so wonderfully combined the flow and quality of milk that she would make 18 pounds of butter a week. Where cows are kept for butter a selection of either the Jersey or Guernsey cross should be made.

Seventy years ago an "Alderney" bull produced a heifer calf, which was reared and all of her female progeny saved. At this day the descendants are kept in the family of the owner of the original heifer, and are still noted as extra-good cows, and the marks of the Alderney breed can be traced, as well as the superior merits. Nearly half a century has elapsed since Henry W. Dolatow imported from England two cows and a bull, "Durham" cattle. These cows were good milkers, and recently I saw two cows, descended from this importation, which showed the old Durham type in great perfection, although several generations removed by crosses upon natives, and they were remarkably good cows. Another farmer began with a half-bred Jersey cow, and by saving and retaining all his heifers for Jersey bulls he has established a herd of grade Jerseys which produce more butter than any other dairy of like number, and twice the amount he used to obtain when all of his stock were natives. Other farmers in the neighborhood have followed his example, and have secured thereby the same results. Grades are nearly, if not quite, as valuable as pure-breds for use in the dairy. They possess the hardiness and strong constitutional qualities of the natives, which keep them free from disease and give them the ability to eat and assimilate almost anything and turn it to the best account. This is proven by the fact that in experiments in feeding to attain great weights, grade Short-horns are usually selected. They combine the frames of the pure-breds and the strong stomachs of the natives.

Grade pigs are by far the most profitable for fattening, on this account. They possess the fineness of bone and flesh and aptitude to fatten of the thoroughbreds, and also the vigorous appetites and stamina of the natives. A thoroughbred sire will add, on this account alone, 25 per cent. to the value of the pigs on those got by a sire of mean or no blood. One South Down ram can double the mutton value of the progeny of more than 100 Merino sheep, and the offspring of these grades, if kept for breeders, may be made more desirable by another cross by a pure-bred sire. The income of the average dairy can be increased one-third by judicious crossing of the best native cows with pure-blood bulls. This statement resolves itself into a sort of mathematical problem by considering the average yield of the dairies of New York, for instance,—which is about 1,300 quarts—and that of a good Ayrshire herd—which will run up to 2,500 quarts. Grade Ayrshires or Holsteins will add to the native side of this proportion from 300 to 500 quarts of milk and grade Guerneseys or Jerseys would add an equal proportion to the average yield of butter. It should be added that the butter of grades is almost identical with that of the pure-breds in color and quality. In fact, the milk of a half-bred Jersey in Charlton, in several cases, has given a yellower color to the butter of the whole dairy. One cross will not often carry with it a close resemblance to the pure-bred ancestors, but three-quarters and seven-eighths—second and third crosses—will generally stamp the progeny with the same markings in color, form of body, the size being graduated by the size of the dam.

The instances we have cited where an original half-blood cross was made without any additions of blood other than native, and which have preserved the special qualities of the original blood so long, not only prove the value of pure blood, but establish the principle of pedigree, and also demonstrate that graded blood has an intrinsic value which may be perpetuated many years. It is poor economy, then, for farmers to shut their eyes to these facts and jeer at "fancy stock" when they should encourage breeders as real benefactors.

HOLDERNESS CATTLE.

The earliest accounts I have seen place these cattle in Holderness, a district of Yorkshire, England, from which they take their name. They were chiefly noted for their great milking qualities. Although coarse and ungainly in appearance, they possessed valuable characteristics in their high and broad carcasses, and contained within themselves the elements of refinement; which has been amply proven in the beef-producing Short-horn and the milk-producing Ayrshire, both of which owe their existence in a great measure to the Holderness.

It was not until the present century that they were introduced into the United States, where they have been greatly improved in their form and general appearance by careful breeding, until they stand unrivaled for beauty and excellence. They produce large quantities of milk of a very superior quality. They are now called American Holderness, as they are essentially an American breed. For the past 30 years their breeding and management have, in many respects, been similar to that of all the successful breeders of pure-bred cattle in England. They have been closely in-and-in bred and improved only by selections made from their own number, with a view of fixing and concentrating their good points still more strongly in the blood and constitution. Sire has been bred to his daughter, the sons and daughters with each other, sons to mothers, etc. This practice has proved eminently successful, producing stock of certain and positive qualities of excellence when bred among themselves, and when crossed upon stock of other families or tribes, stamping their own characteristics upon the progeny with a certainty and strength that could be reached by no kind of miscellaneous breeding whatever. Thus bred, they have become, in a measure, the natural outgrowth of the climate of the country, and their product of butter has been increased from 200 to more than 300 pounds per annum.

It is true that natural causes and conditions have contributed to this end, yet great care and vigilance have been exercised to counteract the smallest tendency to imperfection. The color has gradually deepened from light red and white to a rich brown or almost black, with white along the back and belly and encircling the legs at the body. The skin is so very yellow that it often gives the white the appearance of having been colored. The interior of the ears is like orange peel. The animals are of good size, deep-bodied, with large udders and teats, and with excellent escutcheons. They have a good temper and a kindly, docile disposition, and have a fearless confidence in those who care for them. They are held in high esteem by those who are fortunate enough to possess some of them.

Solsville, N Y. T A C.

JERSEY CATTLE.

Home-bred and Imported.

RICHARD GOODMAN, JR.

A GLAMOUR still surrounds the word "imported." At public sales in this country a cow brought from the Island of Jersey, concerning whose ancestors nothing, or but little, is known, frequently brings twice the price of an American-bred animal whose ancestors for 40 years back are known, and known to have been strong and healthy and to have included numerous large butter-makers. This is wrong. We Americans make a great mistake in considering that, because a thing is *imported*, therefore it is of necessity better than anything home-made or home-bred.

In the earlier days of our existence as a nation there were many things of importance which we could not produce in quality equal to that made in foreign countries, and hence we got into the habit of considering *everything* made abroad better than *anything* made at home. But the time has come for us to overcome this prejudice; to open our eyes to the fact that in many products we have surpassed the inhabitants of the Old World, and in nothing have we reached a higher position as compared with Europe than in the breeding of fine stock. It has taken a deal of hard work and not a few hard knocks to rouse our agricultural brethern to the realization of the fact that in the breeding of horned cattle we have in this country equaled and surpassed Englishmen in Short-horns, Dutchmen in Holsteins and Jerseymen in Jerseys. But the careful breeding and writing and investigating and testing of such men as Mr. Darling, Mr. Kellogg, Mr. Motley, Mr. Hoe, Mr. Waring, Mr. Ellms and others have at length opened the eyes of the world to the merits of American Jerseys, and the prices paid at recent public sales in New York city are proofs in point—American-bred Jersey bulls of from one to six years of age selling for from $500 to $4 500 each. Yet, as has been suggested, the eyes of the entire community are not fully opened to the merits of our own animals as compared with those fresh from the Island of Jersey. For example, at the sales just referred to, imported animals with no known pedigrees brought higher prices than some good home-bred cattle which had American pedigrees running back 30 years.

The following are some of the reasons why buyers and breeders of Jersey cattle should place a higher value upon those having long and good American pedigrees than on those of recent importation. In the first place, it should be remembered that the "foundation stock" of our American Jerseys was selected under the most favorable auspices. The efforts of the Jersey Agricultural Society had for a dozen years been making conspicuous, by selection and awards, the best animals and the best families in the Island when, in 1850, 1851 and 1852, our countrymen, Messrs. Talmor, Motley and others, began their importations. These gentlemen had the good sense to appreciate and the money and energy to promptly appropriate the best animals in the Island. These came to America bearing their first-premium ribbons on their horns and they were distributed in various parts of this country and many fell into hands of men of great wealth and intelligence. Thus we may be said to have had at least an "even start" 30 years ago with our fellow breeders in the Island of Jersey, and I think it cannot be denied that we had more than an even start—we had a "lead;" for though they had more cattle than we, many of their cattle were inferior, while ours were all, or nearly all, good. It is not until of late years that Jerseys of all grades have been poured upon our shore. In the early days intelligent breeders, who were also men of wealth, selected and imported for themselves. Hence is it surprising that most of the best cows in this country to-day trace back to these importations of "the fifties," and, as a rule, the best Jerseys in America to-day have the longest American pedigrees?

Thus it is that we find repeated again and again in the pedigrees of the majority of the best Jersey cows in this country to-day the names of such bulls as Splendid (2), Pilot (3), York (8), St. Clement (10), Prince of Jersey (66), and Colonel (76), and such cows as Lily (1), Pansy (8), Flora (113), and Rose (240). It is not meant to be implied that no good Jerseys have been imported since these early days; numerous animals, excellent themselves and the founders of distinguished families have been imported at intervals ever since 1850, as, for example, the bulls Jerry (15), Rob Roy (17), Saturn (94), and Rajah (340) and such cows as Rhea (166), Duchess (101) and Frankie (17); but most of these were brought to this country before 1865, and have usually been distinguished animals at home, the winners of first prizes at the Island shows, or out of the herds of some very eminent Jersey breeder, and they were certainly very different animals from the majority of those imported during the past dozen years, many of which are sold because of little value and most of which are nameless and numberless until the day of sale. It should not be forgotten that of the ten thousand Jersey cattle in the United States to-day *all* are registered and a careful record kept of their ages, markings, names, numbers, breeders and all ancestors on both sires' and dams' sides; while of the ten thousand in the Island of Jersey a vast majority are unnamed and unregistered and unpedigreed.

But as we began our breeding of Jerseys in this country with some of the best animals then living and also with a very small proportion of inferior animals as compared with our Island competitors, we insist not only that we were more fortunate than the inhabitants of the Island of Jersey in the start, but that our animals have escaped several injurious influences to which the cattle of the Island have been exposed during the past dozen or twenty years. Among these are the influence of the English preference for square outlines in the shape of cattle, and for uniformity of color in the hair. Two other circumstances should be mentioned—one, the use of young bulls, and, the other, the limited amount and quality and variety of fodder and the limited amount of exercise. The influence of English taste has naturally been felt more powerfully by the inhabitants of the Channel Islands than by Americans. Hence we have done much less injury to the butter-producing powers of our Jerseys by seeking to breed them into square Short-horn shapes or into "solid colors." No one familiar with the exhibitions in Jersey and in England during the past dozen years, will deny that many a good Jersey butter family has been seriously injured by the efforts of the breeder to produce animals which in shape and color should please the eye of the judges or rich fanciers at British shows.

As to the use of immature bulls, it is a notorious fact that bulls over two years of age are seldom seen in the Island, while in America bulls are usually kept in use until they are six years of age, and there is one bull now conspicuous before the American public, which is over thirteen years of age. It is unnecessary to go into an argument to prove the injury which must result to any race of cattle or men, which is kept alive exclusively by very youthful sires. And to this immature service should be added the excessive service so common in the Island of Jersey; Mr. Thornton, Secretary of the English Jersey Herd Book, says that it is no uncommon thing for yearling bulls on the Island to serve between two and three hundred cows in one season!

As to the amount of food and exercise the cattle of Jersey enjoy, it should be remembered that the whole Island is only eleven miles in length by four in width, and that the farms average but *four acres* in extent, and that much of this land is devoted to the production of potatoes and early vegetables for the English markets. The cattle are never at liberty to roam at will in search of food and shade and water, and thus to get incidentally healthful exercise.

And when compared with the variety and amount of grass and hay, roots and green fodder, not to speak of the corn and wheat and cotton-seed meal of the United States, we shall see that the cattle of our country have many advantages wholly denied to those of the Channel Islands. It may, in conclusion, be safely asserted that there are more good Jersey cattle in America to-day than in Jersey and England together; that American Jerseys with long American pedigrees possess to-day a higher interest and value to breeders than any which are or can be imported, and that if "fresh blood" is needed it should be "imported" from our sister States rather than from across the water.

Benefit of Feeding Two Quarts of Cotton-Seed Meal Per Day.

As I did not wish to be at the trouble of raising calves from my family cow, I have let her go farrow for several years past. Last November, after being taken up from pasture and put on dry feed in the stable, her butter yield almost immediately fell from six pounds per week to a little less than five pounds; but, what was worse, she lost flesh continually, and by the last of December became quite thin. In addition to her other feed I commenced giving one quart of cotton-seed meal in the morning, and the same quantity again at night. Within a week she began to amend both in flesh and butter. The last was increased to six pounds per week, and held to that on the average till she was turned out to pasture early in May; and since then there is a slight increase. But, what was still more gratifying, by the last of March, she had gained flesh enough to almost make her fit for beef. There is no doubt in my mind that the cotton-seed meal produced a three-fold benefit: first, an increase of butter; second, an increase of flesh; and third, it enabled the cow to digest her other food so much better, that she derived a greater amount of nourishment from it, than she could before receiving this small additional ration. From this and other experiments with cotton-seed meal fed to various domestic animals, think that from a single pint to four quarts per day, according to the kind and size of the animal, is the cheapest additional food that can be given them. "B,"

Literary Miscellany.

MAKING LIFE LOOK BRIGHTER.

Say not, "The world seems dark and drear,"
But strive yourself to light it;
Though ignorance rage, yet never fear,
'Tis manhood's work to fight it!
Strive on, and rust will drop its scales,
The earnest effort seldom fails,
And purpose over doubt prevails,
Thus making life look brighter.

Does virtue meet with small reward?
That thought is worldly-minded;
For vice herself is oft abhorred
By slaves whom she has blinded;
Though now the clouds be dark and dense,
When we shall walk by faith, not sense,
Virtue will have true recompense
The while the clouds grow lighter.

Then call not life a "vale of tears,"
Our lives are what we make them;
And we must weigh by "deeds, not years,"
If we would not mistake them.
Improve the years, and life is sweet;
We sow good seed to reap pure wheat;
Good thoughts and deeds make life complete,
And make the soul grow whiter.

MARJORIE DAW.

MARJORIE DAW was beautiful as the Spring, and as capricious.

Sometimes she was as gentle as the southwest wind blowing over a bank of violets, anon she was petulant as an April storm, tearful, sudden, violent, with the violence of a spoilt child. Then she would be cold, sharp, and shrewish as a northeast wind, sweeping past her friends, chilling those who loved her to their hearts by her cutting scornfulness, mocking all whom she knew, whether she liked them or not.

It fell out that a great many people disliked Marjorie Daw.

A few loved her deeply. One poor fellow worshipped her madly, as few women and—shall we say it, oh, lords of creation?—fewer men deserve to be loved.

Marjorie Daw made fun of everything and everybody, and went on her own way. Her father was a tolerably well-to-do, homely farmer; her home was a rambling farmhouse in a mountainous country.

Yarrow Farm stood half-way up a steep, shady lane; there were thickets of birch and alder at either side the way, and below, far down at the bottom of the slope, a broad stream went tumbling noisily over the stones, running rapidly towards the sea.

One bright May evening, when the sun was setting behind a black-browed mountain that faced the village of Wynn, Marjorie stood at the gate which led out of the Yarrow; she was drawing on a pair of dainty kid gloves. She wore a gray dress of silky texture, a little black lace scarf, and a white straw hat looped up with a gray feather.

"Her father is not wise to let her dress so!"

It was Mrs. Williams, the grocer's wife, who spoke thus to her daughter Jane, a buxom, rosy-faced lass, dressed stiffly as some doll at a country fair, a white shawl folded square and pinned tightly across her chest, a great black bonnet perched on the top of her head, a brown stuff dress, and large brown cotton gloves.

Jane had driven her mother; they had come to bring the week's groceries, and also to pay a visit of ceremony to the family at Yarrow.

The family consisted of Mr. Daw the farmer, his wife, his sister (a prim, kind old woman, in flat curls and spectacles), and the only child of the house, Marjorie.

"Good evening, Miss Marjorie," quoth Mrs. Williams.

Jane had leaped out of the cart; the good horse was browsing at the side of the road. Jane assisted her mother to alight, and then she opened the back of the cart, and with her strong young hands lifted out a basket of groceries.

Marjorie was all beaming with smiles of welcome; she, like her mother, was hospitality itself.

"You'll come in and have a good rest? Have you had tea?"

"Oh, yes; we've had our teas," said Jane; "but it was such a bonny evening, we thought we would come up and see you all."

Marjorie turned and drew a whistle from her girdle, this she blew loudly; a farm-boy came running to the spot, whom she directed to carry the basket into the house; then she ushered the visitors into the strange, quaint old dwelling, where she first saw the light.

There was a narrow stone passage, then there was a wide flagged kitchen, with a great oak dresser and a raftered roof, an enormous fireplace, where some logs of wood smouldered, and some clumsy chairs and tables of dark polished wood.

Marjorie led the way into another room, the glory and pride of the Yarrow, the parlor. Now, the floor of this department was covered with a smart tapestry carpet. The horsehair furniture was enlivened by cushions of silk embroidered by those shapely white hands of Marjorie's, and in one corner was a handsome rosewood piano

"Sit down," said Marjorie, "and I'll call mother."

Mrs. Daw, a handsome, buxom dame, soon appeared. Keziа, the tall bony woman-servant, brought in a great rich cake and a bottle of gooseberry-wine, and soon there was feasting and laughter in the low-ceiled room.

Marjorie stole out when her little, mild spectacled aunt came in. She went again to the gate, and looked once more at the black hill below which the red sun was sinking. The whole sky of the west was a blaze of glory. Golden clouds, like plumes from the wings of the cherubim, floated out into that clear lake of pale blue ether.

Marjorie looked up into the heavens and sighed. She was very beautiful, with dark, dreamy eyes, a skin like alabaster, and features cast in the grand mould of some nymph of ancient Greece. She had a longing after the refinements and elegances of life—a desire to see the world. She was ambitious, talented, with naturally fine tastes. Her soul was akin to poetry and the arts, though she herself was neither poetess nor artist, but only a "spoiled girl, educated beyond her station by her foolish parents," said her female friends of the village below. Marjorie was not content with the station in life wherein she found herself. She was tired of that stone kitchen, with the rattered roof and the oak dresser; tired of her own small neat chamber, with its new, bright Kidderminster carpet, its white muslin curtains its shelves loaded with the works of her favorite authors, Dickens, Tackeray, Tennyson, with a volume here and there of the modern female novelists—tired of the low ceiling and the casement window, with its diamond panes, though the said window commanded a view of the wooded slopes to the left, the village beyond and a whole chain of purple mountain-tops in the distance. Marjorie was tired of it all. There were times when her wayward, impatient heart grew hard and selfish, and then she felt that she was tired of her homely, adoring parents, their north country accents, their old-fashioned notions.

"'See-saw, Marjorie Daw,
Sold her bed and lay upon straw.'"

A little shrill, piping voice was chanting this refrain very loudly in the lane.

Marjorie turned, and perceived a curly-headed, hatless girl, wheeling a chubby, cross-faced child of two, in a perambulator, and singing to it to keep it amused.

The moment the girl ceased to sing the child began to cry; so the girl began again, close to Marjorie's gate:

"'See-saw Marjorie Daw,
Sold her bed and lay upon straw.'"

Majorie smiled faintly.

"Sometimes I feel that I should like to sell myself, if by that means I could become a lady and move in society, ah! and get away from these mountains—they chain me in. I feel in prison when I look out of the window. I hate the country! Oh, to hear those Williams women talk, and to see them eat cake!"

She stamped her foot impatiently. She knew that below in the wood, close by the side of the stream, a young man, ardent and impatient as herself, waited for her in a breathless eagerness; he worshipped the air she breathed; her lightest wishes were his laws, his fiery soul bowed down at her feet; he was talented—nay, he had genius—and his face was noble, but—his pockets were empty; his coat was shabby, "He was not a gentleman by Act of Parliament," as Mrs. Lynn Linton says so cleverly of one of her heroes.

"Do I love Rufus Gorse?" she asked herself. "What an uncouth name; if I were he, I would change it; and his face is fine—only once have I seen a profile like his—the lover in that 'Burial of Attila.'"

Then Marjorie Daw heard the sound of horses' hoofs in the lane, and her heart beat, and her cheeks crimsoned.

Clatter, clatter—trot, trot—is this the lover with the noble face, and the fiery soul, and the uncouth name, Rufus Gorse? She half turns away.

If she darted across the road now she would be able to dive down amid the trees quite unseen by the approaching horseman, and then she would arrive at the stream by the side of which Rufus Gorse paced impatiently—Rufus, tall, erect, stalwart, black-haired, eagle-eyed—Rufus in the very glory and strength of youth—for the horseman who was approaching was not the hero of Marjorie's fancy; and round a bend of the road he came into sight—a little old man with a wrinkled, yellow face, something like the rind of an orange, bestriding a sleek, brown pony.

When the little old man saw Marjorie Daw standing at the gate he raised his soft, low-crowned felt hat high off his head, and smiled, while the crimson flush on Marjorie's cheeks mounted to her white brow.

She hastened to open the gate. The old man dismounted; a second time she used her call whistle, and a lad came running from the farmyard in the rear of the house.

"Take care of Mr. Peter's horse, said Marjorie, softly.

"Well, Miss Marjorie," said Mr. Peter, as he walked side by side with Marjorie over the clean, flat, white stones that paved the path to the door of the house, "and how are the tulips looking?"

"Splendid," she answered. "I was so much obliged to you for those roots! Would you like to walk round and see them? There are some people from Barwell in the parlor."

The old man made a grimace

"I detest having to do the polite to people that don't interest me," he said. "Yes, come along, my dear Miss Marjorie, and let me see the tulips."

They passed through a wicket-gate into a little space that Marjorie called her flower garden; there was a smooth patch of turf, well watered and rolled. In the center was a fine pear tree, covered now with a wealth of lovely white bloom; there were four gravel paths forming a square, and flower-beds ran all round, backed by high hedges of lauristinus and arbutus.

The flower-beds were aflame with a gorgeous show of tulips of all colors, ranging between darkest crimson and faintest pink, deepest orange and palest gold.

"Well, they certainly do you credit, my dear," said wrinkled old Mr. Peter, adjusting his gold-rimmed spectacles on his rather ugly nose. "You will have to come to Beaucourt and see my gardener's show. I think"—wheeling about and looking at her fixedly—"I think I shall have to christen you *La Belle Jardiniere!*"—To be continued.

For Women.

CONDUCTED BY MISS RAY CLARK.

GENTLE INFLUENCES.

VIOLET'S, in the leafiest shade,
By their odors are betrayed;
Soft winds, over flower fields blown,
By their fragrant breath are known;
Dew, by freshened leaves compressed,
Wets unseen Earth's slumbering breast;
Rills from out the bleak hill-side,
Swell to rivers deep and wide;
Rivers flowing fast and free,
Widen to the boundless sea.
All great things that move the Earth,
To gentle issues owe their birth;
And soft influence still is best,
Bringing comfort, love and rest;
Sweet domestic love is strong—
Leads to right and warns from wrong;
Kindly whispers mightier prove,
And to loftier actions move;
Than the fretful voice of scorn,
Of contempt and anger born.

—Chamber's Journal.

HINTS ON PIANOFORTE PRACTICE.

IT is not sufficiently understood by people in general that the basis of all excellence in piano playing is mechanical skill. This, however, consists not merely in flexibility but in power, and in the touch; firm, delicate, or sympathetic, as occasion may require.

Without it the simplest scale passage is indistinct, and the melody which should be smooth and flowing is only a succession of detached sounds. Without it the pianist can impart no soul to his playing. Spiritualists say that their medium must undergo certain training before they are capable of receiving and conveying communications from the spirit world; so it is only through the well-trained fingers that the pianist's emotions can be transmitted. For, while the most superb technique is a servant, it is, nevertheless, a servant bearing the closest relation to the master; the relation of flesh to spirit. Its services are invaluable, and not to be dispensed with.

A proper development of the hands is not, as some imagine, to be obtained by the practice of pieces only. The student who confines himself to pieces encounters numerous mechanical difficulties for which he has not been prepared by previous training. He is as unable to overcome them as the man without any gymnastic training is unable to perform difficult athletic feats; and in neither case are strength and agility gained by the attempts made.

Our piano student, discouraged when he perceives his most assiduous practice to be unavailing except to a limited extent, because his method is imperfect, falls into the habit of skipping difficult passages or of rushing through them in a slovenly manner. He "goes through" a great many more pieces in this superficial way than he would if he gave them thorough, conscientious study; and by so doing it is obvious that the eyes are trained while the fingers are not. Herein we find an answer to the question so often asked, "Why can I read music that I cannot play?"

Whatever may be the degree of mechanical skill desired, it can be obtained only by the careful and diligent practice of scale, five finger exercises, and other technical studies. These are neither more nor less than finger gymnastics, and are subject to the laws that govern all physical exercise. As swinging Indian clubs in a listless, aimless manner will never strengthen and develop the body, so finger gymnastics cannot be beneficial unless properly practised. A correct position is the first thing to be considered. Let the performer sit before the middle of the key-board, at such a distance from it that the arms may move freely in either direction. The elbows should be a trifle lower than the surface of the key-board, their tips being a little nearer the keys than the shoulders. The wrists must be on a level with the hands and arms, the hands quiet. The fingers must move from the knuckles, which are to be kept in a natural position on a level with the back of the hand. The fore part of the fingers should be gently rounded so that the fleshy tips strike the keys (the nails must be short). The thumb should also be moved by the joint connecting it with the hand, and it is by no means to be allowed to hang down or to rest upon the key-board; on the contrary, its tips must be kept slightly above the level of the black keys, from which position it should strike. A natural and easy position, both of the person and the hand, is essential to a good style of playing.

The finger gymnastics should be practiced first with each hand separately, very slowly and in strict time. The fingers must be raised as high as possible before striking each key, and brought down with energy. The thumb should strike with a little less, the third and fourth fingers with a little more force than the first and second fingers. Each finger, after striking, is to be lifted at the instant that the next succeeding finger strikes its key; so that the successive tones may not run into each other or be separated by the slightest gap.

Exercises for wrist-practice should be played by slightly raising the hands from the wrists. If exercises for the fingers are played from the wrists, and those for the wrists are played from the elbows, it is plain that they cannot strengthen and develop the parts for which they are intended.

Gymnastic exercises for the fingers and hands should be taken as judiciously as any other; undue practice of technical studies weakens the muscles they are designed to strengthen. After a correct position has been acquired, and considerable strength and flexibility have been gained, the slow practice of finger gymnastics may be varied, but not supplanted, by more rapid practice.

It is a mistaken idea that because a person has never performed such manual labor, or because hands are naturally well adapted to the piano, no special training is necessary. At the same time we admit that the amount of such training depends somewhat upon the formation of hands; breadth is more essential than length. But, under the most favorable conditions, one must, for two years, devote at least half an hour daily to finger gymnastics, in order to play with ease moderately difficult music.

By that time the student will realize the necessity of continuing such practice if he wishes to retain the skill he has acquired.

Once we heard some one playing five-finger exercises. Although they were of the simplest kind we knew that the pianist's touch was that of no mean performer. Upon inquiry we learned that the player was a lady who had studied music several years in Europe, and was a successful teacher; yet she had not practiced five-finger exercises, but was taking lessons on them from an eminent master.

On telling our teacher (who had taught in the Paris Conservatory of Music) that we still practiced "Plaidy's Technical Studies," the best arrangement of scales and five-finger exercises extant, and the one universally used in the European conservatories, he replied, "Ah, there is material for a lifetime in Plaidy." He used to hold up to us, as an example, a musician who daily played all of Cramer's eighty-four Etudes, which are both difficult and long. We give these few instances, out of many, to show the importance attached by well-trained musicians to the continuance of technical studies, even after great skill has been attained. Well trained musicians, however, are rather the exception than the rule. The performances of the average amateur pianist prove that in this day and generation technical studies for the piano are in no danger of receiving undue attention.

CORRESPONDENT.

ABOUT WOMEN.

QUEEN MARGHERITA is one of the most skillful sewing women in Italy.

IT is reported that Miss Emma Thursby, the American vocalist, will marry a German nobleman of great wealth.

MRS. MARGARET FOX KANE, one of the original spirit-rapping Fox girls of Rochester, N. Y., is still living, but is not a spiritualist.

MRS. JESSIE FREMONT has organized classes in history among the grown-up sons and daughters of poor settlers in Arizona.

MISS KIRKLAND, of Chicago, has finished a statuette of John McCullough as Virginius. She took advantage of rugged John's absence from the country.

MISS ROBERTA WALCOTT HUBBARD, the daughter of Mr. Gardiner G. Hubbard, of Washington, whose marriage to Mr. Charles James Bell, of Leeds, England, has been announced, is the third of the family who has married a foreigner.

ANDIE MYRTLE, a Racine, Wis., girl, jumped the rope 102 times, injuring her brain and other internal organs so that she suffered terribly, and on Thursday she died. Mary Faber, another Racine girl, is very sick from the same cause.

THE marriage of Miss Minnie Evarts to Mr. Tweed is announced to take place early in June, according to the arrangements made before the departure of ex-Secretary and Mrs. Evarts for Paris. The wedding will be a quiet one at the family home in Windsor, Vt., where a married sister of Miss Evarts lives. It is the intention of the bride and groom immediately after the wedding to sail for Europe, and join the parents and sisters of the former in Paris. Miss Evarts left Washington the third week of April.

CORRESPONDENT'S CORNER.

WILL you give me recipe for dying seal brown, also, directions for giving it a new appearance after dying? by so doing you will greatly oblige a warm advocate of your most valuable paper. I enclose a sample of goods I wish to dye.

A RURAL FRIEND.

P. S. Will you give recipe for silvering fluid for brass or tin?

ANS.—Leamon's Aniline Dye which can be obtained in many colors we think will answer your purpose entirely. For silvering, we quote the following:

"SILVERING POWDER.—1. Nitrate of silver, 30 grains; common salt, 30 grains; cream tartar, 200 grains. Mix. Moisten with water and rub on the article with wash leather. Gives a white silvery appearance to brass, copper, etc.

2 NOVARGENT OR PLATE RENOVATOR.—Add common salt to a solution of nitrate of silver until the silver has all been precipitated. Wash the White precipitate or chloride of silver and add a strong solution of hyposulphite of soda until the white chloride is dissolved. Mix the resulting clear liquid with pipe-clay which has been finely powdered and thoroughly washed.

3. 1 oz. of nitrate of silver divided in 1 quart of rain or distilled water. When thoroughly dissolved, add a few crystals of hyposulphite of soda, which will at first form a brown precipitate, but which redissolves if sufficient hyposulphite has been employed. The solution may be used by simply dipping a sponge in it, and rubbing it over the article to be coated. A solution of gold may be made and used in the same manner.

4. SILVERING AMALGAM.—A coating of silver, heavier than can be obtained by the above, may be given by the following process: Precipitate silver from its solution in nitric acid by means of copper. Take of this powder ½ oz.; common salt, 2 oz.; sal ammoniac, 2 oz; and corrosive sublimate, 1 drachm. Make into a paste with water. Having carefully cleaned the copper surface that is to be plated, boil it in a solution of tartar and alum, rub it with the above paste, heat red hot and then polish."

The only safe and sure cure for Gravel or Urinary troubles, is Hop Bitters. Prove it.—*Adv.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CONCERNING HOUSE-HOLD HELPS.

In Two Papers.

MARY WAGER-FISHER.

A FEW years ago, an English family settled upon a worn-out Virginia estate, and one bright member of it has written a book which describes, in a most amusing and delightful way, the experiences they had among the "F. F. V's." Among their perplexities and difficulties was a continual trouble in getting efficient "help," and the author of this racy book confesses that when she was fairly worn out with hard work, she found some "comfort" in the fact that they had not settled "Out West" where the wives of farmers have such a hard time. She thought it enough to make one's heart ache, to read of the wretched slavery of the Western settlers' wives, and she quoted what one woman had written to an Eastern paper, the substance of which was that her husband owned 800 acres of land in Iowa; had reaper, mower, horse rake and various other more or less costly labor-saving farm implements. All harvest time nine men were employed. The woman who was wife, and the mother of five children, one a babe in arms, was expected to have breakfast on the table ready for this party of workmen before sunrise. At night she helped in the milking of nine cows—the baby often crying in her lap during the task. She had butter to make and only a refractory dog to help her with the churning. She had the sour milk to carry to the pigs; to make and mend; wash and starch and iron; wash, dress and feed the children; pick, can, dry or otherwise preserve fruit for Winter use; cook three full meals daily, with a luncheon to be sent to the field, constituted her regular work. The one thing that seemed to her most grievous, was lugging the sour milk from the cellar to the pig-pen. One day as she was dishing the dinner with one hand, baby being on the other arm, she asked one of the hands, who was resting in the porch, to fetch a bucket of water from the spring, and was reproved by her husband for so doing. That reproof was a final straw to break her heart, if not her back, and she found a doleful sort of relief in writing to an Eastern newspaper, detailing her trials, and asking what she ought to do.

Whether this case should be regarded as exceptional, the many Western readers of the RURAL can decide for themselves. But it is unquestionably true, that farmers' wives, as a rule, both East and West, have too heavy a burden to carry; that they break down under it, often die, and the "bereaved" farmers console themselves with wife number two.

That these worked-to-death women are so hedged in by circumstances as not to see how they can do otherwise than actually to work the breath out of their bodies, is easily enough understood by anyone who has had any experience in similar circumstances. There seems to be so much that will go to waste if the mother and wife does not look after everything and the children at all events, *must* be taken care of, so that there are a hundred duties pulling the strings from as many directions, and the faithful, conscientious helpmeet is used up in the turmoil of manual labor that has an altogether inadequate amount of rest and of compensation in it.

I know perfectly well the self-control and the strength of will required to let things go undone, and the one lesson that I have found above all lessons the hardest to learn, is to let every earthly thing go to destruction and waste rather than to allow myself to be wasted; that is, to regard my health and physical welfare of more importance than any amount of money, or anything that represents money, or that can be procured for money. I say this in order to convince such women as may read this, and whose lives seem to demand too much of them, that I fully understand and appreciate their circumstances, and that I know *talking* is one thing and *doing* is altogether another.

In the first place it is always possible to let some things go undone, the doing of which at first appears to be absolutely necessary. In another place, it is by no means essential that the "help" for the house should consist of the female gender. A smart young man to do housework is often worth two women, and there's not a thing connected with housework that a man can't do just as well as a woman, if he only will set himself about it. It is not an uncommon thing in European hotels for the entire service to consist of men. At first it seemed to me odd for a man to do my chamber work, but I very soon became accustomed to it, he did everything so quietly and deftly and without comment. According to the latest census, there are 888,298 more men in this country than women, and this predominence of the male sex exists in 30 States and Territories the excess of males being largest in the Western States, and in the State of Iowa, where the woman lived who had the hardihood to ask a hired man to bring a bucket of water, there are 100,000 males to 91,530 females. These are facts which no one can well dispute, and where there are so many more men than women, there ought to be no reason why women should be so overworked, providing this excess of men can be turned into "hired help."

Now, that Iowa woman undoubtedly was well-meaning, but for all that she was what might be called, without any exaggeration, a "Born Fool," and her husband was a monster of cruelty, who it is to be hoped has long ere this "passed to his reward." But in all probability he still lives, and is grinding the life out of that woman with his farm of 800 acres, nine cows and nine "hands" at harvest time. To protect such wives and to punish such husbands, there ought to be societies supported by the State, for the Prevention of Cruelty to Wives, as the wives themselves are not made of the stuff that is self-protecting. The duty of that woman was obvious enough, and it is not worth while to tell what or how she ought to have done.—To be continued.

ANOTHER WEEK FROM MRS. CLAY'S JOURNAL.

ANNIE L. JACK.

SABBATH.—What a blessing is a good *school* for the children in the morning or afternoon of this day of rest. It is of more value than we think, and better for the little ones than the long sermon they often have to sit through, with their legs dangling from the high seats, and not daring to kick. I remember, when Nora was a little mite of a girl, she was very anxious to go to church. Three Sundays in succession I yielded to her pleading voice, and, dressed in her prettiest frock, she sat with wonderful decorum beside me in the pew. Friends, on coming out, spoke kindly to her; one lady remarked that she was "the best-behaved child in church." One day, a little while after this, I asked her if she could tell me anything the minister said. She shook her curly head. Did she never hear him talk of Jesus, and the Bible? Shake No. 2. Then suddenly she spoke: "But I can tell you what he *does*," and suiting the action to the word, she shook her tiny fists and brought them down on a book with force, saying, "He pounds the big book, and stamps his feet as if he was mad, and makes great big eyes at me, and looks so cross he makes me frightened." It was but the opinion of a six-year-old child, but I have since wondered if a little Sunday-school talking at home would not have been better understood.

We make it a point to have as little cooking as possible on this day of rest. I think a piece of cold roast lamb, with a salad and potatoes and a dessert of fruit, fresh or canned, is very easy and simple to prepare. This is what we intend to have today. The potatoes were prepared at breakfast-time, and need only to be put on the fire to boil while the table is being set. In Summer an iced pudding of rice, corn-starch, or custard is a very nice addition to the fruit, by way of a change. But my stand-by is fruit in its season, and out of it as far as I can have it by canning. And by these simple economies of time and labor we try to work together for each other's good, and enjoy our Sabbath not only for its spiritual privileges, but as a blessed gift from Heaven—a day of *rest*.

THE FORENOON LUNCH.

IT was a hard day in Mrs. Morris's kitchen, and Bridget was cross and the work dragged, and Mrs. Morris herself felt wearied and faint by mid-forenoon. Now she might have scolded and hurried Bridget and fretted herself into a white heat by dinner-time, when the world would have looked dark enough to her. But she chose a better plan. She made a nice cup of tea in the bright little tea-pot, took out a saucer of fruit for herself and one for Bridget, added a slice of cake and set Bridget's out on the kitchen table.

"There, Bridget, when you get time, stop and pour yourself a cup of tea, as I have done, and take a little lunch. It will rest you, we both need it after an early breakfast."

"Thank you, ma'am," said Bridget smiling, "It's you knows how to make a good cup of tay." So she sat on the back porch step, in the pleasant Autumn sunshine, and sipped her tea and ate her fruit and cake, thinking to herself that it wasn't every woman who would have taken that trouble. Mrs. Morris sipped her tea by the sitting-room window looking out on the pleasant door-yard, with its bright clusters of Chrysanthemums, hardily blooming in spite of early frosts. It was only a little way side rest to both women; but it did them a deal of good. It strengthened them for the rest of the morning's work, made both more cheerful and more one in feeling with regard to the house and its labors. This friendliness between employer and employed is worth cultivating. No one is the better for being pampered; but little kindly attentions that show a really friendly heart, are dear indeed to "the stranger in a strange land."

This occasional lunch when it is needed will often help one wonderfully through the day's duties. If one is really hungry it is the right time to eat, and often if the meal is deferred for an hour or two the appetite is gone and a sense of overweariness and languor has taken its place. Nothing can disorder the digestion worse than picking and eating bits at all hours. Our digestive apparatus is got up on very different principles from the sparrow's. But a regular, light lunch in the middle of a hard-working forenoon is very useful to many. And while you are providing for yourself, it is a little kitchen courtesy to give "a cup that cheers but not inebriates," to Bridget also. It will work well I know, for I have tried it. Some little treat of that kind to look forward to, is often an incentive to quicker, better work, because done in a happier spirit. OLIVE GRAY.

THAT QUESTION.

I WAS in hopes that Mrs. Wager-Fisher would condescend to notice the reply of "E. M. W." which appeared in the RURAL NEW-YORKER; but, on reflection, it would be folly for her to do so, hence her silence. The common people are prone to ridicule etiquette and refinement, and persist in adhering to their inbred vulgarity. Mrs. Fisher's motive in opening the question was undoubtedly a good one. She desired to impress upon the parent the importance of a good example to the child. If parents are destitute of the ordinary usages of polite society, they will surely *mortify* their grown-up daughters, although they may be possessed of "good sense, natural affection, and true nobility of soul." R. M. L.

[Port Huron Commercial.]

Charles Nelson, Esq., Proprietor Nelson House, speaking to us recently, observed: I suffered so much with Rheumatism that my arm withered, and physicians could not help me. I was in despair of my life, when some one advised me to try St. Jacobs Oil. I did so, and as if by magic, I was instantly relieved, and, by the continued use o the Oil entirely cured. I thank heaven for having used this wonderful remedy, for it *saved my life*. It also cured my wife.—*Adv.*

The Literary

Revolution.

To keep in good humor the good people who delight in good books; to wake up the slow booksellers who are inclined to go to sleep in the summer, instead of, like a 'possum, in the winter; and to prevent our friends, the book publishers, from forgetting us, we have concluded to publish a few more cheap books. If we are to name him at all, we must, of course, head the list with the immortal Shakespeare, and will give you either his "Merchant of Venice" or "Hamlet," or any one of his fourteen other principal plays, in beautiful type, for 2 cents. At the same price you may have the great," former price $1.25, or Carlyle's "Robert Burns," or Lamartine's "Life of Mary Queen of Scots," or Thomas Hughes's "Manliness of Christ." Washington Irving's wonderful, delightful, heretofore inaccessible "Sketch Book," which contains the incomparable Rip Van Winkle, you can have for a dime. For the same price we will give you "Tom Brown at Rugby," the best boy's book ever written, except "Robinson Crusoe," which you can have also for 10 cents. To charm those who delight in fiction, we give also for 10 cents each, Cooper's "Last of the Mohicans," one of the most justly celebrated American novels, and Charles Kingsley's "Hypatia," which worthily ranks at the very front of famous historical fiction. These are only specimens of the cheap books we publish, are all in good type, neatly printed, and are not in the broad side or any other "slide" or "square" style, but handy pocket volumes, of course in paper binding. Our motto, however, has always been that a book worth reading is worth preserving, as well as worth owning, and our large list of standard books, to which we are making additions, with speed unprecedented in the history of publishing, are all elegantly and strongly bound, in cloth or better style, and so it at prices proportionately low with those in paper covers. We issue these few only in pamphlet form, as specimens of the quality of our good literature, and these special terms will not be long continued throughout the United States and Canada are prepared to either abundantly supply or liberally slander our publications. We give liberal terms to clubs where no bookseller acts as agent. Descriptive Catalogue, and illustrated pamphlet describing book-making and type-setting by steam, will be sent free, on request. News of the Week.

HOME NEWS.

MONDAY, June 6, 1881.

The Senatorial contest at Albany has almost wholly superseded legislation. On Tuesday balloting for successors to Conkling and Platt, began. The Democrats put in nomination State Senator Jacobs and Ex-U. S. Senator Kernan. On the first ballot on Tuesday Conkling received 35 votes and Platt 29 and these figures did not vary much during the week. Messrs Cornell and Wheeler and Rogers of the Administration faction and Jacobs of the Democrats are Conkling's closest rivals, while Depew, Cornell, and Kernan (dem) are making Platt's chances for re-election less certain. Indeed, unless something new turns up, it is highly probable that no election will take place during this session of the legislature.

The Whittaker court martial convened on the 1st inst. to hear ex-Governor Chamberlain sum up the case for the defense. About 7,000 pages of testimony have been collected. Now for the grand *finale*.

The legislature of this State has passed a law that a tax of $1 shall be levied on each immigrant who arrives at Castle Garden.

Decoration Day was celebrated with unusual interest throughout the country. The parade in this city was one of the finest ever witnessed on such an occasion.

There was a meeting of the League of American Wheelmen in Boston on the 30th ult. There were about 800 bicycles in line. The riding was considered excellent, and no bruised heads were reported.

Jeremiah Hall, D. D., ex-President of Denison University, Granville, Ohio, died on the 30th ult., at Port Haven, Mich., aged 76.

Thirty-seven years ago the first telegraphic message was sent in this country. To-day there are 400,000 miles of telegraphic lines in the United States. Since July, 1866, the Western Union alone has expended, over and above dividends, surplus earnings, etc., the sum of $17,000,000 in constructing lines and purchasing other completed lines.

A hurricane visited Taylor, Texas, last week, lasting forty minutes. Houses and churches were blown from their foundations and several families injured. Nearly all the barns and outhouses were demolished, and scarcely a house in town escaped, while the fences and trees for miles were laid low.

A violent storm also swept over Dallas on the same day. Rain fell in torrents, with heavy hail. Fruit trees were injured, and the corn, cotton and wheat crops destroyed. There was also a fearful hail storm in the northern part of Bell county.

In their intense rivalry the Chicago newspapers are building "newspaper cars" to carry their Sunday morning papers to points within twenty-five miles or so of Chicago on the various railroads. The Tribune is the first in the field, its car having been completed and ready to deliver the papers on Sunday the 29th ult.

Prof. William D. Whitney, of Yale College Connecticut, has been decorated knight of the order of Pour Le Merite, for scientific attainments and ability as a Sanscrit scholar.

Thomas C. Platt has $9,000 a year as president of an express company, $1,500 a year as quarantine commissioner, and used to have $5,000 a year as United States senator.

New York and Brooklyn are the only cities on this continent in which the elevated railway system has been introduced.

The decoration of Confederate graves by Northerners is rapidly becoming an every-day occurrence. A touching incident of this kind was a visit of the Boston Commandery of Knight Templars of Boston to the Stonewall Jackson monument in Richmond, Va., the other day, and the placing of a wreath of rare flowers at its base.

President Garfield will attend the graduating exercises of the Naval Academy at Annapolis, June 10, and the commencement exercises at Williams College on July 4, 5 and 6.

The Iowa Greenbackers, in convention at Marshalltown on the 2d inst., nominated D. M. Clark, of Wayne County, for Governor, and Mrs. Mary E. Nash, of Des Moines, for Superintendent of Education.

The great event of the week in the Knight Templar circles of Pennsylvania was the annual parade held this year at Scranton, where 2,000 uniformed Knights were in line. Sir Geo. W. Kendrick, Jr., delivered an admirable address.

The faculty of the Northwestern University, at Evanston, Ill., have decided to tender the Presidency of the university to Rev. Dr. Cummings, who has filled the chair of moral philosophy at Middletown, Conn.

The second meeting to discuss the advisability of holding a World's Fair in Boston in 1885 was held in that city June 1st, and a committee of 27 was voted to consider the items of cost, probable income, site, time, etc. The meeting was enthusiastically favorable to the project.

There is talk of forming a German University at Milwaukee, Wis., and of raising $2,000,000 for the project.

Secretary Blaine and Mr. Thornton, the British Minister, have settled the vexed question about the Fortune Bay, N. F., fishing troubles, by an agreement that the British Government shall pay £15,000, and that the United States will give a receipt in full.

General Kilpatrick will sail for Chili in about one month to relieve Mr. Osborne as United States Minister there.

The brother of Pierre Lorillard, who is at Newport, R. I., is authority for the statement that the latter wins $2,000,000 on one bet made on the result of the Derby race, in which Lorillard's "Iroquois was the winner.

On the 2d inst. Charles H. Bell was elected Governor of New Hampshire by the State Legislature. The popular vote gave him 44,432 out of 86,164 votes cast. Frank Jones was a good second with 40,813.

"A Hundred Per Cent. Better."

A patient in Michigan, who reports a gain of thirteen and three quarter pounds in two weeks, says: "I cough about once where I did ten times before, and *do not raise one quarter the mucus from my lungs that I did*. My pulse has gone down from 120 to 85. My digestion is very much improved, and the stomach retains the food. In short, *I am one hundred per cent. better than I was three weeks ago*, and I give all the praise and credit to the use of Compound Oxygen. The expressions of my friends are, 'Wonderful!' 'Astonishing!' 'Almost miraculous!'" Our Treatise on Compound Oxygen, containing large reports of cases and full information, *sent free*. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

A number of enterprising citizens of Louisville, Ky., have organized the "Louisville Fair Association," and will hold an exhibition during ten days of the coming Autumn in the avowed interest of the general trade of that city. A special exhibit will be made of fine Kentucky stock.....A South Carolina paper says that thousands and thousands of doves are infesting the rice-fields of West Wateree. In some places the rice has been replanted two and three times, and yet the stand is not good, owing to its destruction by the birds.... The locusts are making terrible havoc in some parts of North Carolina, eating up corn, cotton and destroying standing timber.....Pasteur states that, at a farm near Senlis, France, cattle which had died of carbuncular fever twelve years ago were buried at a certain spot within a walled garden. Some specimens of the soil were, after that lapse of time, lixiviated and concentrated, and some guinea pigs inoculated with the matter died soon afterward, developing all of the well-marked symptoms of carbuncle. Seven sheep were allowed to pass a few hours a day at the place where the diseased animals were interred, and the result of this experiment was that two of the sheep died of fever in about six weeks. The vitality of the germs of this disease is remarkable

At Minneapolis, Minn., on May 25, there occured the second annual sale of the Meadow Lawn and Browndale stock farm. Sixty head were sold and brought an aggregate of $7,930 an average of $132.17. The following are the names of the highest-priced animals and the buyers:—Fidget's Gwynne, 2 years, H. McCray, $385; Miss. Wiley of Edina, 7 years, O. A. Pray, $375; Wild Eyes of Browndale, 5 years, C. McReeve $310; Caroline of Meadow Lawn, 3 years, A. Kelly $230; Oxford Wild Eyes, 3 years, bull C. McReeve $210 Call, 2 years, W. Fowler $210; K. Mina, 4 years $190.....A strange and fatal disease has broken out among the hogs at the Agricultural College, Mich. On Friday week the animals were fed as usual, and partook of the food with an apparent relish. In a few hours after six of them died and at noon on Saturday 14 in all had died. Prof. Murray of Detroit, who visited the college dissected a few, but as yet has found no positive cause for the strange malady. As the animals were in good condition, the extremely warm weather may have caused them to be attacked with apoplexy .....The Indiana Short-horn breeders met at Indianapolis on May 21. The Association elected the following officers: President, Thomas Nelson, Parke County; Vice-President, J. W. Robe, Putman; Secretary, T. Sunmann; Treasurer, W. W. Thrasher. The Association then adjourned. One of the subjects to be discussed at the next meeting is the cause of Short-horn bulls becoming worthless at three or four years of age..... At Herkness' Bazar, Philadelphia, May 26, 33 head of Jerseys sold for $11,345, an average of $343.78 per head....At Nashville, Tenn., May 18, 33 head of the same kind of cattle sold for $11,955, an average of $362.97.....Fifty-three million forest trees are reported to have been planted in Nebraska.....On Saturday week Mr. Jewett M. Richmond of Buffalo added to his herd four imported Jerseys the aggregate cost of which amounted to $4,700. Among these are several prize winners, notably a two-year old heifer, "Camma 12020," which received first prize as a yearling, and whose sire "Young Prince 183," was awarded first prize in his class over all Jersey in 1870.....The Kansas City Indicator says: "All reports in regard to the growing wheat crop of Kansas are of an encouraging character, and unless present indications are sadly at fault the yield will be much larger than last year or in previous years. The reports from Western Missouri are also good in regard to the growing wheat." An average crop in Italy is: Wheat, 132,800,000 bushels; Maize; 85,600,000 bushels; oats, 19,440,000 bushels. The crop of 1880 according to official reports just published, was for wheat 17 per cent above an average; for Maize 9 per cent below and for oats three per cent below. With a good harvest the country requires 7,500,000 bushels from abroad.....

The Iowa Agricultural Department report for May is briefly as follows: For Winter wheat from 230 townships, the aggregate area is placed at 76,846 acres, and the average condition 68½ per cent. In 25 towns no Winter wheat is growing; in 28 it has very little attention; in 58 it wintered well; in 125 it was unequal or entirely Winter killed, and 208 report the seeding of Spring wheat. Wheat in hands in 57 counties, represented by 700 townships, 279,925 bushels.....Rye, 90 counties and 314 townships, report the acreage at 56,506 acres; 417 townships give the average condition at 93 per cent.....Barley, 10 counties and 10 townships, report the acreage at 1,010 acres, and the avorage condition 90 per cent.....Corn on hand and in cribs in 55 counties and 354 townships show an aggregate of 21,607,011 bushels; and 53 counties, from 122 townships, report an aggregate of corn consumed for fuel of 330,075 bushels, valued at $48,725.....

Last Saturday the steamer Saxon landed a large consignment of valuable breeding cattle at this port. They are of the Booth Short-horn blood and were purchased at the celebrated Warlaby farm on the Thames, England, by Mr. Charles Morgan, son of the senior member of the banking firm of Matthew Morgan & Sons. Among them are the heifers Georgia Regia and Rufa, for which Mr. Morgan paid $1,250 apiece; the cows Saxon Queen costing $2,000; Bright Rose and Moira, costing $500 each; Miriam, costing $3,000, and her calf, which was one day old when Mr. Morgan purchased it for $500, and one other cow, for which $1,250 were paid. The bull Royal George, costing $3,000 is among the lot, and also a number of cows and heifers for which less fancy prices were paid. The cost of the entire consignment in England was $14,500, which sum the insurance, duties and transportation charges swell to nearly $20,000. The cattle were shipped at Warlaby on the steamship Milanese. The steamer was wrecked on the Thames near Gravesend, and the cattle were, with much difficulty, transferred to the Saxon Monarch. On landing they were shipped by rail to the stock farm near Bordentown, N. J., which Mr. Morgan has prepared for breeding purposes and has christened New Warlaby. Mr. Morgan has recently come into possession of an inheritance, and, having a decided taste for stock raising, proposes to establish a model breeding farm.

An Old Doctor's Advice.

It was this: "Trust in God and keep your bowels open." For this purpose take Kidney-Wort—for no other remedy so effectually overcomes this condition, and that without the distress and griping which other medicines cause. Try a box or bottle.—Telegraph.

With more than usual satisfaction we call attention to one of our oldest advertisers whose chief claim is "the best at a fair price." You having use for any size scales will do more than well by sending to Jones of Binghamton, Binghamton, N. Y., for his, *free* book on scales.

Women that have been bedridden for years have been entirely cured of female weakness by the use of Lydia E. Pinkham's Vegetable Compound. Send to Mrs. Lydia E. Pinkham 233 Western Avenue, Lynn, Mass., for pamphlets.

I have used Higgin's Eureka Salt for the last year and consider it superior to any other salt and I have tried them all. B. A. RINGER. Lisbon Creamery, Lisbon, Iowa, March 14, 1881.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

When worn down and ready to take your bed, Hop Bitters is what you need to relieve you.

The Peoples' World-Wide Verdict.

Burnett's Cocoaine has been sold in every civilized country, and the public have rendered the verdict that it is the *cheapest and best Hair Dressing in the world*.

Burnett's Flavoring Extracts are invariably acknowledged the purest and the best.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, June 4.

Chicago.—WHEAT unsettled; No. 2 red Winter, $.07@1 11; No 2 Chicago Spring, $1,09¼ cash; No. 3 do. 97c @$1.02; rejected, 84@80c. CORN moderately active at 43@43¼c. cash. OATS in good demand at 37@37¼c. cash. RYE steady at $1.10. BARLEY steady at 95c. PORK dull at $16 12½ cash; $16.05@16.10 June; $16.20 July; $16.32½ August. Lard easier at $10.57½ cash; $10 02½@10 65 July; $10 55@10.67½ August. BUTTER dull; fair to fancy creamery, 17@21c.; good to fine dairy, 14@17c. CHEESE quiet; new full creams, 8@9c. EGGS 13c. SEEDS—Timothy quiet at $2@2 40; clover firm at $3.70@4 20; flax, $1.14. HOGS—market closed weak, with some stock unsold; mixed packing, $5 40@5.70; light bacon, $5.60@5.75; light Yorkers, $5 10@5.30; choice heavy packing and shipping, $5.80@6.10. CATTLE—Demand fair; best grades strong; export, $5 90@6 10; good to choice shipping, $5 70@5.90; common to fair, $5@5 45; distillery, $5.20@5.60; wintered Texans, $4 50@5; grass Texans in very full supply, but slow; poor to choice, $3@4; butchers' steady at $2 50@4 75; inferior old cows and mixed neglected; stockers and feeders dull, weak and lower at $3.70@5 SHEEP—Market dull and weak, over supplied with poor stock; poor to choice shorn natives, $4.20@5.20.

Cincinnati.—WHEAT weak; No. 2 Red Winter, 1,13. CORN dull; heavy receipts have depressed the market; No. 2 Mixed, 46½c. OATS dull; No. 2 Mixed, 41c. RYE dull; No. 2, $1 16@1 20. BARLEY nominal; no offerings. PORK inactive at $16 50. LARD quiet at $10 50. BULK MEATS quiet but firm; Shoulders, $6 00; Clear Rib, $8 37½. BACON quiet and unchanged. BUTTER—The average quality is now probably as good as can be expected. This is the view which packers take of it, and they are buying quite freely for fruit-house storage, and this demand keeps stock from accumulating in receivers' hands and also keeps prices from breaking down to a still lower basis. The demand for creamery is larger than ever before in the history of the trade, but the groduction has increased in fully as large a ratio, and prices have further declined, in sympathy with New York. Fancy Creamery sells at 20@23c, choice Dairy at 16@18c, choice Western Reserve at 14@16c, prime to choice Central Ohio 12@14c, medium do 10@12c, and inferior 5@8c ₱ lb. CHEESE—The arrivals have been liberal, and as there is no immediate increase in the demand the market has been easy during the week and prices have declined fully 1c., closing dull at 7½@8½c, for good to prime factory. EGGS—The arrivals have been unusually light for this season of the year and prices have advanced to 14c. per dozen, closing strong. HOGS steady; common and light, $4 25@5 85; packing and butchers', $4 30@6 10.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, June 4, 1881

BEANS AND PEAS.—The bean seems to have sunk into its warm weather lull and prices are quoted to their full limits. Outside rates for medium only made for local wants. Exports of marrows not important. Red kidneys move fairly. The demand is perhaps more noted for them in Summer than at other times. Green peas are quiet at a range of $1.40@1.60 for Wis. bbls. Southern B. E. quiet and a shade off to sell. Last quotations for Canadian field 85@90c. in bond.

Marrow beans, prime, $2.52½@2.57½; other, $2.30@2.45; medium, prime, $2.45@2.50; other, $2.20@2.35; pea $2.25@2.50; white kidney, $2.30@2.50; red kidney, prime, $1.60@1.61½; fair to good, $1.40@1.50; black or turtle soup, $1.45@1.50.

Receipts for week, 1 200 bush.

Exports do. 1200 pkgs.

BUTTER.—The main effort of the week on the part of dealers in State has been to let prices down to a point at which shippers were somewhat committed to operate. Yesterday the market struck an open quotation of 30c. and there was some free purchasing for export. It is highly probable, however that just as easy rates have been made during the week. At the close the feeling on State is firmer as the drain upon fine table grades has been pretty severe. Still dealers do not intend to hold for rates that will tend to allow an accommodation. Western butter has ruled steady as to quality has made it attractive at the comparatively favorable prices. The price prospect abroad for butter this season has a cheap outlook and the market here will have to shape accordingly. One favorable point is the low price of ice, which will permit more cold storage than for last Summer should supplies crowd.

COMPARATIVE RECEIPTS AND EXPORTS.

			Receipts, pkgs.	Exports, firkins.
June 1, '80	to June 1, '81		1,491,900	270,100
" 1, '79,	" 1, '80		1,499,900	310,810
" 1, '78,	" 1, '79		1,530,550	313,110
" 1, '77,	" 1, '78		1 293,100	186,208

Creamery—Western, good to prime, 19@20c.; State and Penn. 19@21c.; poor, 18c.; sweet cream, 19@20c.; State pails and half tubs, choice, 20c.; fair to prime, 17½@19c.; Welsh tubs, 17@20c.; poor State, 12@17c.; firkins yellow, 21c.; Western imitation, 16@18c.; dairy, fine, 16@17c.; other, 13@15c.; factory or ladle-packed, best, 15@15½c.; other, 10@14c., very poor Western, 8@9c.

Receipts for week, 37,152 pkgs.; exports, 5,233 do.

CHEESE.—The market has lost in buoyancy of tone and feeling and at the close it was difficult to make the extreme figure of last week and impossible to do so in a large way. The 10c. quotation is named but with the prospect of a good deal of stock carrying over into next week, when receipts may again prove large; prices for all upper grades will be likely to further weaken.

COMPARATIVE RECEIPTS AND EXPORTS.

Receipts for week, 72,980 boxes.

Exports for week, 56,523 boxes.

Liverpool cable, 55s.

Steam to Liverpool, 20@25s.

COTTON.—A brighter aspect has attended cotton this week. There has been no very large dealing, but the unprecedented activity in cotton goods and a better trade response from Liverpool have encouraged spot and speculative operations.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

The close of the market for futures was officially reported as follows: June, 10,96@10.98c.; July, 11.03@11.04c.; August, 11.11@11.12c.; September, 10.67@10.68c.; October, 10.26@10.24c.; November, 10.15@10.16c.; December, 10.2@10.17c.; January, 10.37@10.38c. February, 10.47@10.48c.; March, weak.

DRIED FRUITS.—The market for evaporated apples is quiet but supplies are under good control. Sun-dried are steady and supported by a continental export demand. Small fruits dull but not unseasonably so. Quotations are mainly repeated.

Apples evaporated choice 8¾@9c; fair to prime 7¾@8¾c. North Carolina sliced, common to best 4@5c. Va, do. 4@4¼c; Tenn in bbls. 4½@4¾c, do, bags 4@4½c. State fine cut 4@4¼c. quarters 4½@4⅝c, Western, 4½@4¼c; evaporated peaches peeled 27@30c., unpeeled 17@20c; very poor 10c; sun-dried peeled 5@5½c; unpeeled 3@3½c. Plums 12@12½c. Blackberries 8@8½c. Cherries 12@13½c. Raspberries 23@24c. Whortleberries 11½c.

Receipts for the week, all kinds, 1,0.0 pkgs.

Exports dried apples, 1,450 pkgs.

EGGS—Receipts for week, 11,900 bbls.; do. last week 15 300 do. Supplies have run light and with no troublesome surplus the market is in sellers' favor for all strictly prime stock. After this date eggs, to rate first class will be subjected to inspectors' average of losses.

Near points, 17c.; State and Pa., 16½c.; Western and Canada, 15½@16c.; Md. and W. Va. 15½@16c.; poor lots, 14@15c.; duck, 15@16c.; goose 20@22c.

FEATHERS.—Prime white geese, 55@60c.; mixed, 25@40c.

FURS AND SKINS.—The following are the ruling rates for prime No. 1 quality:—

	Nor. & East.	W. & S. W.
Fisher	7,00@10.00	6.00@9.00
Black Bear	7.00@14.00	5.00@9 00
Cubs and yearlings	3.00@ 5.00	2.00@4.00
Otter, each	8.00@10.00	6.00@8.00
Beaver, per lb	2.50@ 3.50	2.50@2.75
Mink, dark	1.00@ 1.25	60@ 75
Mink, pale	60@ 75	40@ 50
Red Fox	1.40@ 1.60	1.00@1.35
Grey Fox	80@ 90	50@ 70
Raccoon, each	70@ 80	45@ 60
Skunk, black	1.00@ 1.10	80@1.00
Skunk, half-striped	55@ 60	50@ 55
Skunk, striped	25@ 30	25@ 30
Skunk, white	10@ 15	10@ 15
Opossum (trash out)	....	11@ 14
Muskrat, spring	16@ 18	14@ 15
Muskrat, winter	12@ 15	10@ 12
Muskrat, fall	9@ 11	8@ 10

FLOUR.—The week notes the unusual event of stronger prices on high grades of flour with cheaper rates for export brands. The latter have shown a very free business.

No. 2 ₱ bbl. $3 05@3.50; State and Western superfine, $4.@4.70; city mills extra, $5@6 70; Spring wheat do. $4.60@5 00; Spring XX and XXX, $5.25 @6.0. patents, $6 50@8; Ohio round hoop shipping $4.80@5.25; trade brands, $5.40@6.25; Southern extra $5,00@5 40; do. double extra, $5.60@6.00; do. family, 6.25@7; Southern shipping, $5.25@5.85; do. XX and family, $6@6.75. Rye,

$5 50@6. Corn-meal, Brandywine, $3.35@3.40; Western, $2 90@3.20.

Receipts for week, 117,000 bbls.

Exports, do. 60,501 do.

FRESH FRUITS.—The larger portion of the supply of strawberries has sold low; the weather has been poor and trains have arrived late and the trade for Southern berries spoiled for several days. The last arrival of Norfolks proved a loss. New Jersey begins to send good Wilsons.

Southern N. J., quarts, 9@11c.; Upper N. J., quarts, 12@14c. do. pints, 6@7c.; M. and Del., 5@10c. A few Russet apples quoted at $2@2.50 ₱ bbl. Md and Del. gooseberries, best $1.75@2; do. cherries ₱ lb., 8@10c. Hot-house grapes, new uneven in quality; Black Hamburgs quoted at $1@2 per lb. Peanuts steady; Va. hand-picked, 4½@4¾c. per lb.; fancy, 4@4¼c; extra prime, 3½@4c. good to prime, 3¼@3½c.; shelled, 2½@3¼c.; pecans firm at late advances 7@10c.

GRAIN.—Varied crop reports have caused considerable confusion in wheat rates. This is one of the phases of the market at this part of the season, and, though there is nothing positively detrimental to be pointed at, the fitful fluctuations of the market have prevented exporters from operating in the volume of last week. Corn has shown disturbed and irregular figures consequent upon the large settlements of contracts for the close of the recent month. The market closes steady with the prospects of an early resumption of regular business. These rumors will also apply to oats. Rye is lower.

Wheat, Spring $1.12@1.21, red Winter No. 2 $1.25@1.25½; red Winter $1.14@1.18. white Western and State $1.12@1.25. Rye, $1.08@1.12. Oats, white No. 1 50@51c.; white No. 2, 47@47½c.. white No. 3 46½c; mixed No 1 45½c; do. No. 2 45¾@45¾; do. No. 3 43½@44½c. Corn, Western mixed 47@51c.; do. No. 2 54½@54¾c; do. yellow 57@58c; do. white 62@65½c: Southern 63@66c.; do. yellow 55@58c.

Receipts for week, wheat, bush., 883 400; corn, do. 1,135,050; oats do. 242,500; rye, do. 19,393; malt, do. 555,800; barley, do. 21,900, rice pkgs. 770.

Exports for week wheat, bush 1,424,300; corn, do. 1,013,760; oats do. 2..00; rice, pkgs. 2 035.

VISIBLE SUPPLY OF GRAIN IN THE UNITED STATES AND CANADA.

	Wheat. bu h.	Corn. bush.	Oats. bush	Barley. bush	Rye. bush.
May 28, '81...	14 509,321	2,8 2 828	4,589,239	5 3,093	347 327
May 21, '81...	6,561,830	11,233,039	3,721,218	737,502	2 ,567

HAY AND STRAW. With heavy receipts of hay the market has broken into low figures and can hardly recover, with quality running almost under grade.

Choice retailing timothy hay 95c. ₱ 100 lbs.; second quality, 85@8 c. do.; shipping 70@75 c. do.; clover mixed 75@80c. do. pure 70@75 c.; prairie hay, 65@70c. Long rye straw $1.0 @1.10 ₱ 100 lbs.; short do. 60@65c. do.; other grain, 45@60c. do.

Exports for week, 1,3.0 bales.

HOPS.—Brewers are in market but seem to want concessions. Exporters are no relief at the moment.

Crop 0 choice 21@22c good to prime 18@20c; fair to good 15@ 8c poor to fair 12½@15c; eastern 13@21c; 79's fair to prime 15@17c; 1878, 6c.

Exports for week, 429 bales.

Receipts for week 47 bales.

MAPLE SUGAR.—Has merely a chance call when carried into the Summer, and the remnant is freely off red at. sirup, in tin, per qt, of 10@11 lbs. 70c.@$1, with can; sugar, cakes, 7@10c ₱ lb.

MILK.—Low prices have attended the excessive supply. Arrivals are one-third above a liberal city call and up to Tuesday a good many commission cans little more than paid freight. The average was quoted at Harlem platform at 65c. ₱ can of 40 qts., the range showing 30@75c.

OIL CAKE.—Firm at $30 for Western bag.

POULTRY AND GAME.—The sale of Spring chickens is retarded by the unfavorable weather for near by watering points. Turkeys unsaleable if not really prime. A coming Jewish holiday stimulates prices for choice birds.

Dressed turkeys, choice 15@17c; coarse 13@14c; Phila. Spring chickens 30@65c; N. J. 30@40c; Phila. Winter 30@35c do. Fall 18@22c fowls, Phila. d.p. 16c; N. J. d.p. 14@15c. do. scalded 13@14c. State and Western 12@13c; do. d.p. 13@14c. Ducks, Spring, 30@35c.; old 12@15c., Squabs, white, $2,50@3 ₱doz.; do dark, $1.50@1.75.

Live poultry is abundant and fowls are dull and cheap. Spring chickens when four pounds or nearly sell better than any other regardless of the higher price.

Spring chickens prime ₱ pair $1; other 30@70c. Fowls, ₱ lb. 11@13c, the lower for Southern; roosters, 6@7c.; turkeys mixed 9@10c; ducks, ₱ pair 60@ 90c; geese, extra $1.50; other 87c@$1.37.

Game is scarce; a few lots of Mo. wild pigeons sold quickly at $1 50 ₱ doz.; w. squab $1; Eng. snipe and plover $2.25@2.50.

PROVISIONS.—Hog products generally are less a "sellers' market" than for a time past. Very heavy supplies of hogs at the West have made some of the stocks too heavy to carry with Summer here and with the new pressure to sell; bacon, hams and cutmeats are easier with lard sympathizing.

Pork extra prime $14 ₱ bbl.; Western mess new $16,50@16.75; old $15.50@15.75. Lard—Western steam $10.95@11 per 100 lbs.; prime city $10. 5. Hams smoked city 11@11½c. pickled Western 10@10½c; shoulders smoked city 8½@8½c; picked 7¾c. Bacon long clear 8¾@9c. Beef W plain mess $9 00@10; extra mess, $11@11.50; family $12@13; extra India tcs; $22@24. beef hams $20@23.

Receipts for week, beef, bbls and tcs, 700 pork, bbls. 2,800; cut-meats, pkgs. 15.430; lard do. 11.230.

Exports for week, beef, bbls and tcs., 1,868. pork do. 3,309. cut-meats, lbs. 1,2:4,487; lard, do. 6,595,500.

TOBACCO.—No new changes since our last.

VEGETABLES.—Potatoes are in good demand with new selling well As new Southern or other appear the market for old is restricted to fine perfect stock.

Bermuda potatoes new $7@8 ₱ bbl.; Ch'n and Sav. $4@6 cnils $2@2.50 best old Rose in double heads $3 do. Peachblow and Snowflake $2,50; other styles $1.62@1.87.

There is an easy feeling in green stuff as the season is advancing; green peas, cabbage and asparagus have the steadiest sale; the latter begins to advance.

Green peas, N. J. per bbl $2.50@5; Md. $2.50@3 Norfolk per ½ bbl. 50@75c; marrow fat $1; Southern stringbeans $2,50@3 ₱ crate; Sav. cucumbers $4.50@5; Fla. $1@2; do tomatoes, $1 50@2; Bermuda ₱ 5-qt. box 50@60c.; squash Fla. per bu crate 50@$1; cabbages, Norfolk $75c@$1.25 beets, do. 100 bchs. $3@4; do. L. I. $5@8; Bermuda onions, $1@1.12 ₱ crate; lettuce, 50c@$1; asparagus, Oyster Bay, $1.75@2 per doz.; other $1.25@1.50 radishes, per 100 bchs 50@$1; rhubarb do. $1@1.50; white turnips do. $3@4.

WOOL.—The demand is more animated and with the better movement for raw material the declining tendency, lately marked, has been in some degree arrested. About previous prices are given with more tone.

Ohio, Penn, and W. Va. XXX and picklock, 43@44c.; X to XX. 38@41c.; No. 2 to No. 1, 35@41c. coarse, 33@36c. combing 39@45.

State and Western X and XX, 38@39c.; No, 2 to No. 1 36@43c.; coarse 30@35c.; combing, 38@44c.; combing unwashed 25@30c.

Va., W. Va. and Md. unwashed medium 26@29c.; Ga. and Lake unwashed medium 26@28c.; coarse 22@24c burry and slightly burry 14@19c; Cal. Spring northern, free, 29@33c.; middle counties, free, 26@28c.; low grade and burry, 18@21c.; Fall, choice, 23@25c.; low grade and burry 15@20c. Texas choice, free, 25@28c.; fair to good 22@24c.; low grade and burry 15@20c. Pulled super 38@42c.; extra 35@38c; No. 1, 20@23c: combing 38@43c. lambs 38@42c. Tub washed, fair to choice 35@42c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, June 4 1881.

BEEVES.—Receipts for the week 11.876 head: do. last week 12,855 do. Sellers have tried hard all the week to get matter running their way, and after the two tough markets of Monday and Wednesday last have succeeded. The market yesterday showed an advance of fully ½c. and butchers were anxious buyers. This little improvement does not of course cover late losses, but it is something to have the yards cleared with a firm closing after an advance. Low railroad freights have permitted a good many outside shipments, but these have a limit and regular operators are now encouraged. The first Texan cattle arrived on Monday selling at 8¼@8½c. dress 55@56 lbs. We quote this week a range of 10¼ to 11¾c. dress 56@57 lb a car load of fancy sold at 12c. Nothing of decent grade sold below 10¾c.

MILCH COWS.—The past has been one of the dull weeks of cow trade and dullness in this branch of live stock means a decline. Compared with last week prices are $5 per head lower for good styles; most sales have been at $40@55 per head, the latter very extreme.

VEAL CALVES ive are lower and close without prospective improvement.

Prime N. J. fed, 6@6¼c.; do. state, 5¾@6c.; poor to good yard lots, 4½@5¾c.; Mt. Holleys 6@7c.; buttermilks, 4c; up-river dressed, 7¼@10c Our quotations include Washington Market stock.

SHEEP AND LAMBS.—Receipts for the week 22,778 head; do. last week 29,130 do. Sheep have sold well; several sales closing at 5@5¾c. for ordinary to good. Lambs have been scarce and high prices are rather forced. Va. and Ky. have sold at 9@10c.; Penn. 8¾@10c., and N. J. 10@11¾c. Dressed lambs have made 8@12c

SWINE.—Receipts for the week 30.311 head; do. last week, 27,583 do. The market is very weak with liberal supplies in sight and no special activity on change; best price for corn-fed $5 80@6 ₱ 100 lbs. City dressed State, 8@8½c.; do. Western, 7½c.

All good articles are imitated and Higgin's English Salt is no exception Several brands of so-called sifted salt are now offered, but grinding up pancake and then sifting it with the salt is not the Higgins Process by a great deal.

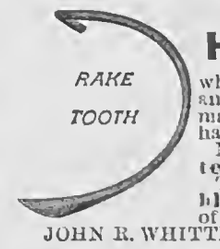
PROFESSOR
HORSFORD'S
PHOSPHATIC
BAKING POWDER

Made from Professor Horsford's Acid Phosphate.
Recommended by leading physicians.
Makes lighter biscuit, cakes, etc., and is healthier than ordinary Baking Powder.
In cans. Sold at a reasonable price.
The Horsford Almanac and Cook Book sent free.
Rumford Chemical Works, Providence, R. I.

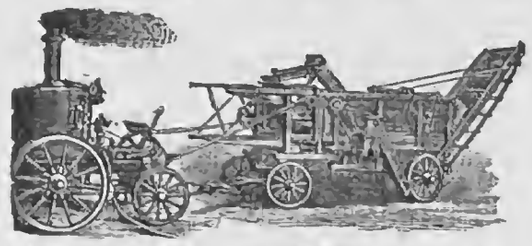
SEDGWICK'S
Steel Wire Fence.
Is the only general purpose wire fence in use. Being a strong net-work, without barbs, it will turn dogs, pigs, poultry, as well as the most vicious stock, without danger to either fence or stock. It is just the fence for farmers, gardeners, stock-raisers and railroads; very desirable for lawns, parks or cemeteries. As it is covered with rust-proof paint it will last a lifetime. It is superior to boards in every respect, and far better than barbed wire. We ask for it a fair trial, knowing it will wear itself into favor. The **Sedgwick Gates**, made of wrought-iron pipe and steel wire, defy all competition in neatness, lightness, strength and durability. We also make the **BEST** and **CHEAPEST ALL IRON** Automatic or Self-opening Gate. Ask hardware dealers, or for price list and particulars address **SEDGWICK BROS., Richmond, Ind.**

CALVES & COWS
Prevented Sucking each other—also
SELF-SUCKING,
by Rice's Patent Weaner, USED *by all* STOCK-RAISERS. Prices by mail, *post-paid:* For Calves till 6 m's old, 30c.; till 1 year, 50c.; till 2 yrs., 75c.: older $1. *Circulars free. Agents wanted.*
H. C. RICE,
Easthampton, Mass.



Champion Patent Tooth
HORSE RAKE
which does not scratch the ground and dust the hay. **Best Rake** made. Buy no other rake, and have clean hay.
New **Victor Lever Feed-Cutter.** *Largest and best made.*
The best **Champion Vegetable Cutter** made. Cuts a bushel of potatoes in 23 seconds.
JOHN R. WHITTEMORE, Chicopee Falls, Mass.

THE WESTINGHOUSE



Threshing Machines
ENGINES & HORSE POWERS.
Grain Threshers, unequaled in capacity for separating and cleaning.
Combined Grain and Clover Threshers, fully equal to regular grain machines on grain, and a genuine **Clover Huller** in addition.
Engines, positively the most desirable for Lightness, Economy, Power and Safety. Boiler has horizontal tubes, and is therefore free from the objectionable features of vertical boilers.
Horse Powers, both Lever and Endless Chain. All sizes. Send for Catalogue. Address

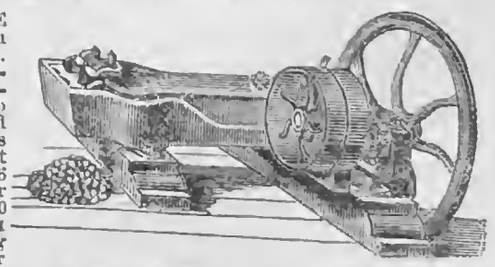
Wholesale trade prices to dealers on application.
Founded 1784. **DAVID LANDRETH & SONS,** 21 and 23 S. Sixth St., Philadelphia.

CHEAPEST AND BEST FERTILIZER---FOLLOW NATURE.



Which USES GROUND RAW LIMESTONE in MAKING THE SOIL. There were no Lime Kilns around burning lime when the good **Limestone Farming lands** were originally made. Every Farmer can prepare his own Fertilizer with an **ordinary Horse Power** by using **FORSTER'S COMBINED CRUSHER & PULVERIZER,** which takes a lump of Limestone three to five inches square, and Crushes and Pulverizes it in **one operation,** same as Burr's. Farmers use the Ground Raw Limestone, and drill and sow it just as it comes from the machine. W. W. Reed, of Erie, has tried it 6 years, and says it shows a profit over Bone Dust of $1.95 per acre; over Phosphate of $4.28 per acre; over Guano of $9 70 per acre; over Salt of $5.90 per acre, **and that it will last twice as long."**—John G. Bear, of Montgomery, Lycoming Co., says: "I believe it to be the cheapest and best Fertilizer in this country. *It is worth three times as much as Burnt Lime, and with this machine does not cost half a much as Burnt Lime to make.*"—H. C. Falls, New Castle, Pa., says: "I used the Ground Limestone last year with great satisfaction as to results, and cannot too strongly recommend it for farm and garden purposes Where I dropped my corn on top of it, the corn came up first, and was strong and thrifty—the Limestone drawing the moisture to the roots. Used in place of Paris-green on Potatoes, it kept the Bugs away and made the plants thrifty and strong; being washed into the ground, it benefited the Potatoes in an astonishing manner. Address only **TOTTEN & CO., Pittsburgh, Pa.** ONLY MAKERS.

Reading for the Young.

FARMING FOR BOYS AND GIRLS—NO. 24.

HENRY STEWART.

The Digestion of Food.

THE alimentary canal is of great length. In the sheep it is 28 times as long as the body; in the cow it is 22 times as long; in the pig it is 13 times as long; in the horse 10 times, in mankind nearly seven times as long. This extreme length is required to give effect to the slow process of digestion of the food and to retain it in the intestines long enough to extract all the nutriment from it. The whole process of digestion is as follows: The ood taken into the mouth is broken up and ground between the teeth. There are three kinds of teeth; the front or cutting teeth, sometimes called nippers; the canine teeth or tushes, and the molars or grinding teeth. A horse has 40 teeth; a man has 32; a mare has but 36, the 4 canine teeth being wanting in mares; an ox or cow has 32, but has no cutting teeth or nippers on the upper jaw; a sheep has 32 teeth arranged as in the ox, and a

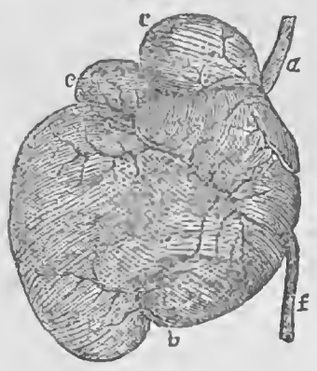


FIG. 298.

pig has 44. The functions of the teeth are important, as the complete mastication of the food is absolutely necessary to perfect digestion. As the food is ground between the teeth, it is mixed with a fluid called saliva, secreted from glands in the mouth, known as the salivary glands. This food possesses some solvent or digestible qualities and partly dissolves the food and assists the stomach in its fuller solution.

After the food is masticated and mixed with saliva, it passes down the gullet into the stomach The stomach is lined with a membrane which is furnished with a vast number of very small tubes, from each of which is conveyed a fluid known as the gastric juice which dissolves the food. When the food enters the stomach, these tubes begin to pour out this fluid, which is mixed with the food by an alternate muscular contraction and expansion of the stomach. At the bottom of each tube is a gland, which is called the peptic gland; this gland is the actual source of the gastric juice.

The cow, sheep, goat, deer and some others are known as ruminating animals, or animals which

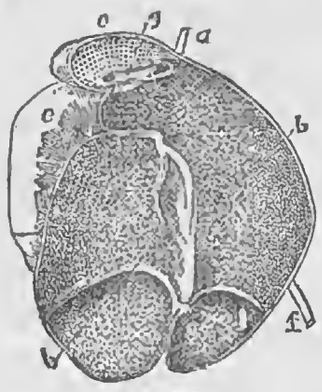

FIG. 299.

chew the cud. The stomach of the ruminating animal consists of four divisions, as shown at Figs. 298 and 299. The former engraving represents the outward appearance of the stomach of a ruminant; the latter, the appearance of the inside; at *a* is the end of the gullet, and at Fig. 299 is seen the opening by which the food passes into the first division of the stomach, *b b*, and also into the second division *c*. The food eaten by a cow or sheep is forced in small portions at a time by a contraction of the stomach *b*, into the small pouch *g*, between the first and second stomachs, as these are called. It is here molded into a long ball, or cud which the animal brings up into the mouth, where it is slowly chewed over again. It is then brought into a thin pulp or paste and when it is again swallowed, it passes through this passage and enters the third stomach which lies directly behind the second one, so that it cannot be here shown. This third stomach is provided with a number of leaves or folds something like the leaves of a book; and the food being caught between these is rubbed and ground until it is reduced to a condition of extreme fineness, when it passes on to a fourth or real digestive stomach, *e*. Here it is mixed with the gastric juice and is slowly digested. This four-fold stomach performs no more work in the end than the single stomach of a horse or a pig; nor can we define its purpose or explain why an ox or a sheep should require so peculiar an apparatus to perform the work which the simpler stomach of a horse performs equally well. But in investigating the works of nature we find many things which we cannot explain, but nothing which is not extremely well adapted for its special purpose and which does not evince a remarkable wisdom of design, or wonderful fitness and effectiveness. A further study of the digestive process of an animal and of the intricate machinery and material which are provided for this purpose, will be found a most instructive and entertaining pursuit and one that will be of the greatest interest and value to every young farmer.

THE YOUNG QUERIST.

J. W., Felicity, Ohio, asks what we think of glass flower-pots.

ANS.—We don't think they are as good as earthen ware. They lack porosity, the plant-roots contained are liable to injury through the action of the sun and they are more costly than earthen pots.

W. N., Selina, Ohio, wishes to know whether potatoes are roots or tubers.

ANS.—"Irish" potatoes, so called, are tubers, but sweet potatoes are simply roots. A tuber is an underground branch or thickened root-stock. The eyes of potatoes are in reality buds.

E. A. H., Chagrin Falls, Ohio, wishes to know how to propagate Winter-blooming carnations.

ANS.—From seed sown in early Spring The best strains, so introduced, may be maintained by cuttings the same as the geranium or coleus. The cuttings are placed in boxes of sand kept moist and warm.

C. W., Akron, Ohio, wishes to know the botanical names of the common daisy and China Aster.

ANS.—The former is called Bell's perennis; the latter Callistephus Chinensis.

F. M. A. B., Madison, Wis., wishes the address of "Hawai Nei."

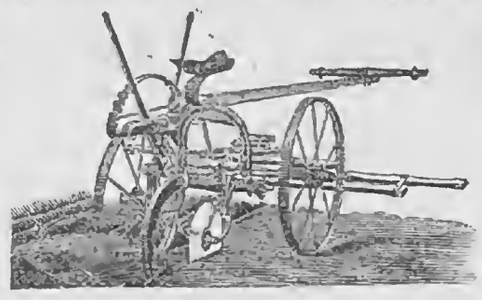
ANS.—Honolulu, Sandwich Islands.

That invalid wife, mother, sister or child can be made the picture of health with Hop Bitters.—*Adv.*

Implements and Machinery.

CHAMPION SULKY PLOW

THE MODEL PLOW.



PERFECTION ITSELF.

A PLOW OF GREAT STRENGTH.

Simplicity, Durability and Ease of Operation. Adapted for use everywhere. Circulars giving full information free. Address J. LANE REED & CO., (Sole Manufacturers,) DAYTON, OHIO.

"Victor" one-horse Wheat Drills

(3 and 5 hoed,)

FOR SOWING WHEAT, RYE, BARLEY, in fallow Ground or in standing corn.

Force feed; simply constructed. The five hoed is adjustable for different widths, and is just what every small farmer ought to have, saving the price of a Two-Horse Drill.

Manufactured only by EWALD OVER, (Send for Circulars.) Indianapolis, Ind.

Hull Vapor Cook Stove.

The only Vapor Cook Stove that has stood the test of years, and given entire and perfect satisfaction.

Now in use, and growing in favor wherever used.

For Summer Use they are Indispensable.

60 Mark Lane, London, England. 90 Water St., N. Y. P. O. Box 990.

Professor C. V. Riley says: "It can be more effectually sprinkled or sprayed on to the plant than Paris green by virtue of its greater fineness."

Professor C. E. Bessey says: "It quickly kills both the Larvæ and the Winged Insects."

Professor A. J. Cook says: "With this cheap poison we have no longer reason to fear such enemies as the canker worm, etc."

Professor J. L. Budd says: A single application placed every one of the pests on their backs over the ground, either dead or in a dying condition, in less than six hours.

PERSONAL ITEMS.

Ex-Governor Horatio Seymour has gone into the Adirondacks for his health. He is not strong, and was too tired to respond to a serenade at Lowville the other evening.

General Ignatieff, the present head of the Czar's Government, is described as very clever, but not too honest. He sprang from the lesser nobility, who are as numerous as sand grains on the seashore, and has had a "lucky" career throughout. The French speak of such a fortunate person as "a man born with his hair dressed."

The Hon. George B. Loring, the new Commissioner of Agriculture, is the son of a clergyman. The story goes that his father was famous for keeping very fat pigs, a couple of which he "once upon a time" sent to a neighboring fair in charge of George and his brother, both lank, hungry-looking youngsters. The pigs attracted a good deal of admiration, much to the delight and pride of the boys until an old farmer remarked in their hearing, "Yes, indeed, parson Loring do keep mighty fine pigs; but seems to me he ought'er give ess to eat to his pigs and more to his boys."

[Fort Wayne, (Ind.) Sentinel.]

When about twelve years old said Mr. Geisman, of the Globe Chop House to our representative, I met with an accident with a horse, by which my skull was fractured, and ever since I have suffered with the most excruciating rheumatic pains. Of late I applied St Jacobs Oil which has given me almost total relief.—*Adv.*

Implements and Machinery.

The A. P. Dickey Farm and Warehouse
FANNING MILLS.

THE BEST IN THE WORLD.
Obtained Centennial Award and Grand Medal, also best award at Paris exposition in 1878. They clean perfectly, Oats, Chess, Cockle, and all foul matter from Wheat and Barley. *They grade and separate for seeding and market*, clean all kinds of small seeds, and are perfect chaffers. They will save any one their cost annually. Lowest freights procured for purchasers.
Address DICKEY & PEASE, Racine, Wis

THE S. R. NYE IMPROVED
BAY STATE RAKE.

MANUFACTURED BY THE
BELCHER & TAYLOR
AGRICULTURAL TOOL COMPANY,
Chicopee Falls, Mass.

This Rake received the highest award at the Centennial Exposition and Field Trial. The only Silver Medal awarded at the Paris Universal Exposition, in 1878. It is easily handled by a girl or boy strong enough to drive a horse. Send for circulars.

BEST WASHER AND WRINGER *in the world.* Guaranteed to do perfect work or money refunded. Warranted for 5 years. Price of washer, $8. Sample to agents, $3.50. Price of Wringer, $7,50. Sample, $4.25. Circulars free.
ERIE WASHER CO., Erie, Pa.

CIDER! CIDER!

WANTED—All interested to know that the secret of success in Cider-making consists, first, in using the celebrated **Jersey Apple Grinder** and **Champion Cider Press**, because they make the cleanest, the clearest and the largest quantity possible to obtain. Special attention is also called to our new patent **Stationary Double Platform** which is a great improvement and can be applied to any Press. For Illustrated Circulars, containing information of great value to every cider maker, apply to

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XL.—No. 1638.} NEW YORK, JUNE 18, 1881. {PRICE FIVE CENTS $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Biographical.

GEORGE B. LORING.

BY PRESIDENT LEVI STOCKBRIDGE, OF AMHERST, MASS.

HON. GEO. B. LORING, the new Commissioner of Agriculture, is a native of, and has always resided in, Essex County, Mass. He graduated at Harvard College, studied the medical profession and received his M. D. Soon after commencing the practice of his profession, a change of circumstances made him the proprietor of a farm of about 300 acres two miles from the city of Salem, on which for nearly 30 years he has made his home. Abandoning medical practice for which he possessed every qualification of success, he devoted his time, energies and education to the cultivation and improvement of his farm and made it in every respect one of the best in that region. For many years he has been a leader in all enterprizes for the advancement of the agriculture of his native State, and on his own farm he has illustrated what may be accomplished in renovating soils, improving stock and crops, by high culture and a knowledge of the true elements of success in farming. In 1858 the members of the Essex County Agricultural Society elected him as their delegate to the Massachusetts Board of Agriculture for three years, and he was subsequently re-elected for six consecutive terms, giving him 21 years of continued service on the board. During all these years he took an active and leading interest in all its deliberations and operations. He was especially influential in securing the acceptance of the national grant for agricultural colleges, and in all the preliminary measures for the establishment and successful opening of such a college in his State.

As delegate from the Board of Agriculture he visited and addressed every agricultural society in his own and most of the New England and Middle States, making himself perfectly familiar with their agricultural condition, and offering suggestions for its improvement. In the service of the board he prepared papers on a wide range of agricultural topics, which were published in the annual State reports, and which rank among the best of our agricultural literature. He has been an active, influential citizen as well as farmer, and interested in all the public movements of the day. He has served repeatedly in both branches of the State Legislature, been President of the Massachusetts Senate two years, and represented his fellow-citizens two terms in Congress. It is undoubtedly the fact, that we have never had a Commissioner who possessed such varied talents and acquirements, such a complete knowledge of, and interest in, the cause he is called upon to serve as Geo. B. Loring, and much may be expected from his administration of the affairs of the Department.

[The portrait presented has been drawn and engraved from a photograph kindly sent to us by Dr. Loring at our request.—EDS.]

Farm Economy.

THE APPLICATION OF FARM-YARD DUNG.

J. B. LAWES, L. L. D., F. R. S.

THE economic application of farm-yard dung must, to a certain extent, be based upon its composition, and there are two processes by which this may be ascertained, first by direct analysis, and second by calculation.

Many years ago I published a series of calculations based upon the food consumed upon a farm of 400 acres, the quantity of straw used as litter and the loss by respiration. The farm was estimated to have 100 acres in turnips or mangels, 100 in hay, and 200 in wheat and barley. The amount of dung produced was equal to 957 tons (of 2,000 pounds), or about 2½ tons for each acre. The composition per ton was as follows:

	Pounds.
Water	1,400
Dry matter	600
Minerals	55¾
Phosphoric acid as phosphate of lime	10
Potash	10¾
Nitrogen	13

This estimate agrees very well with the analyses made by Bonssingault, Voelcker and ourselves, and may be said to represent the composition of good unfermented farm-yard manure. We are indebted to Dr. Voelcker for several analyses of the dung in different stages of decomposition, and he shows that only a very small proportion, probably not more than two pounds of the 13 pounds of nitrogen contained in each ton, is in the form of ammonia. Considerably more than 90 per cent. of the whole of the dung consists therefore of water and wood. A large proportion of the manure constituents of the dung exists in combination with the straw or the solid excrements of the animals, substances which decompose very slowly in the soil, and for this reason it takes a larger amount of dung to produce much effect on vegetation.

GEORGE B. LORING, Commissioner of Agriculture.
From a Photograph.—Fig. 300.

Our experiments lead us to the conclusion that the influence of one dressing of dung may not be entirely at an end for 20 or 30 years, or perhaps even a longer period.

With the composition of dung before me, and the known composition and condition of the various ingredients it contains, the question has often occurred to me as to whether it will be possible to do anything by way of improving its fertilizing powers. Ought we to fix the ammonia, or ought we to try and manipulate it in some way to hasten its action? If we can get the full effect of an artificial manure in one year, why must we wait a life-time to see the end of one application of dung? Time is money; the old-fashioned idea that a manure is valuable for its *lasting* properties will not bear argument, as, if true, it would then be better to leave bones and phosphate rock unground.

With all this scientific prelude, I am bound to confess that I am just as helpless in regard to the management or improvement of dung as the most old-fashioned farmer. It is of no use fixing ammonia where there is hardly any to fix. It costs nothing to look at your dung with the idea of doing something to it; but you certainly cannot touch it without going to some considerable expense. I, for my part, therefore am content to let it alone. As I grow a good many mangels, I apply the greater part of the dung to this crop, my practice being to open out the furrows and apply about 20 tons per acre, then, after earthing up the furrows, I proceed to drill the seed upon the top.

If I did not grow roots, I should apply the dung in Autumn to the clover or grass; this, of course, would involve exposure to the atmosphere, but I should not fear much loss on this account, or at all events I do not think that there would be more by this process than by any other.

To give some idea of our attempt to estimate the loss of the ingredients contained in dung, I may say that we applied it to grass land between 1856 and 1863, and, having taken a crop of hay every year since, at the end of 20 years we had only got back 14 per cent. of the nitrogen supplied in the manure, less than one-half of the potash, and not much more than one-third of the phosphoric acid. The effect of the dung last applied 18 years ago is still quite distinct, and when it will come to an end no one can predict. On the whole, as regards the question of economy, I am therefore inclined to advise that the dung should be carted from the yards to the field, and left there in a heap until required for application, or that it should be applied direct from the yards. All labor expended upon dung adds certainly to the cost, but does not add with the same certainty to its value.

THE WEIGHT OF COW DUNG.

I AM not in the habit of publishing statements which I have not fully proven before they are made public. I have had much occasion to know something of the weight and other properties of cow dung, and I know, as I stated, that normal cow dung always sooner or latter sinks in water. There undoubtedly are cases where a diseased or otherwise unnatnrally conditioned animal may drop dung which will for a time swim in the water, but not on it. I was recently looking at a very fine young animal when it made a very great effort to dung, and finally dropped a small amount of hard, dry matter. I caught the dung and carefully placed it upon water when it for a moment or two floated. But it gradually sank into the water as the air in its pores gave place to the water, and in less than three minutes after it left the animal it was at the bottom of the water. Every boy in the country and every man who was ever a boy among boys, has heard the expression, "How we hoss-dungs swim," when somebody thought some fellow was putting on airs. The plural is always used, and the expression derives its origin and significance from the fact that the separate lumps or balls of horse dung are more inflated than the rest of the mass and are supposed to feel above their fellows. I have a horse that is entitled to and receives some indulgences, among them the free range of a stable large enough for several common box stalls. In one corner of it a water-pail is kept. Sometimes he backs up into the corner and drops his dung into the pail, but I have never found any of it floating the next morning. My observation is, that horse dung always sinks just as fast as the water forces the gases out of the pores of the dung. Sometimes a few bits of undigested hay float, but the mass goes to the bottom as surely as lead.

The ungracious allusion to what the writer terms my "fights" over the specific gravity of cream is wholly irrelevant. In the first place I never had any fights over it. It is true that a writer, much in the same spirit as shown in this case, at one time undertook to disprove one of my positions by citing certain authorities in proof of a different standard of specific gravity from what it was falsely stated I had set up. Fortunately I was able to show that I had wholly disclaimed the figures quoted or any other as a "standard" and also to show that in every one of the cases cited against me the samples of cream had been of a wholly exceptional quality and in no case taken from the whole cream of whole milk. I never undertook to say that cow dung or horse dung might not be found that would float for a time, or to disprove that iron under certain circumstances will swim. I only spoke of the substances in their normal condition. Quibbling is not becoming in men who write for the information of the public. O. S. BLISS.

Georgia, Vt.

PULVERIZED TOP SOIL AS A MULCH.—In regard to cultivated soil acting as a mulch, my opinion of the matter is this—that plants during a dry time depend more upon moisture from below the surface than from above, and that the moisture is brought up by the capillary action of the soil, and that if the soil be cultivated—broken—near the surface, the capillary action is largely destroyed to the depth of several inches, and that this broken soil quickly dries out in the same manner that a leaf withers, that is broken from the parent stem. The capillary tubes below the surface, nearer to the roots of the plant, continue to act, however, and consequently the plant receives more moisture and shows less effect from dry

weather; and now this dry soil near the surface, in my opinion, acts as a mulch in that it prevents moisture from passing off from below; but admits it freely from above. As proof of the correctness of this theory, let any one dig down a foot in well cultivated soil and see if it is not more moist than at the same depth in soil which has been allowed to become hard and baked A. W.

Horticultural.

THE building in which the American Pomological Society had its birth has just been razed to the ground, and its dust was covering the tables and desks of the RURAL'S office when I was last there. It stood at the corner of Nassau and Beekman Streets, New York, and years ago was known as Clinton Hall. I was Chairman of the Committee of Arrangement and Reception, and I remember remaining in the hall more than half the night unpacking fruit and getting things ready for the morrow, for the fruit was more than was ever before or since seen on exhibition in New York, and continued to arrive all the next morning. I remember, too, what efficient aid I received from Mr. Samuel Allen, the father of your correspondent, Mr. A. B. Allen. He was a most amiable and estimable gentleman, full of good works, and was then, I think, nearly 90 years old; but, notwithstanding his great age, no other member of the committee for weeks gave me anything like the help he did. I was then but a young man, and felt that we ought to change places on the committee; but that would only have increased his labors. I have always cherished his memory kindly as one of the real fathers of the Society, not only assisting at the birth, but in the preparations for it. It has always been thought meet and proper to preserve the memory of the spot where great men were born and died; then why not so with the spot where a great society was born? As to its death, I hope it may so live that its death can only be recorded by some one in that remote future of which no one now living can have any conception. Let me add, too, my kindly wishes for my old friend, its venerable and respected President. May his latter days be as peaceful as his long life has been useful.

DURING a brief visit at the beautiful country seat of Mr. H. W. Collender I had an opportunity of becoming acquainted with a novel and quite original method of growing strawberries in pots. Mr. Collender last Fall ordered from a traveling agent (Goldie by name), claiming to represent a Rochester firm, quite a large number of pot-grown strawberry plants; but, for some reason, they were not delivered till this Spring. It was evident, on examination by Mr. C. and his gardener, that the plants had not been grown in pots, and investigation developed the fact that the plants, just before being delivered, had been *molded* in pots with wet earth. This, however, had been so imperfectly done as to betray the trick by the falling away of the earth, and exposing the doubled-up roots. Moreover, there are parties who claim to have seen the thing done. It is not to be supposed that any respectable house in Rochester was a party to such a transaction. Mr. Collender, then, paid the additional price for pot-grown plants (and that, too, in the Spring) without reaping any of the benefits to be derived from them. He will hereafter do as I have before advised the readers of the RURAL to do—buy his pot-grown plants directly of responsible firms, and let traveling agents severely alone.

I AM more than ever surprised this Spring to see how few understand the usual directions for sowing seed. When it is directed to "sow in drills half an inch deep," the drill is made half an inch deep, and the seed, when covered, is scarcely even a quarter of an inch deep. The phrase is taken in its literal sense, and it is a pity that any one should be led astray for thus giving a phrase its legitimate meaning. By usage among seedsmen and others, however, and a sort of uncouth antiphrasis, the sentence is intended to mean that the seed should be sown half an inch deep in drills. To accomplish this, the drills should be nearly or quite an inch deep, as they are commonly made, as the hoe throws the earth up at least half an inch above the level of the soil, and sometimes more. Complaints of bad seeding are very common, but a very large percentage of failures in the growth of seed may be imputed to bad sowing rather than to bad seed. Being too near the surface, in a loose bed of earth, the sun burns off the germ on its first appearance; and this is especially the case in dry weather when no pains are taken to bring the seed and the soil in contact with each other. The pea will bear, and even needs in our climate, deeper covering than almost any other seed; and yet the covering in some cases is so shallow that many of the seed are pushed out of the ground in the act of germination, of which I have just seen a marked instance in the garden of a new subscriber to the RURAL. People who seed the pea in this way seldom or never get much of a late crop; it is neither peas for themselves nor peace for the seedsman. My observation has taught me that too shallow sowing, with neglect of pressing the earth to the seed in dry weather, is a much too common cause of failure in the germination of seed. Shallow sowing will do very well when the soil is sufficiently moist; but it is better not to trust too much to this.

How are the potato beetles this Spring at the Rural Farm? [Never more flourishing.—EDS.] Did anybody ever before know these pests to begin their destructive work so early in the season? I have been down along the Delaware River, and there the beetles were sitting in the fields in companies, waiting for the potatoes to come up, and a shoot was pounced upon the moment it appeared above ground. The beetles seem to be more numerous than ever.

[WE beg to make a remark. Everybody has said, "Destroy the old beetles as fast as they appear in the Spring. Hand-pick them. If the old ones are destroyed, there will be no young ones," etc. Last year we went over our potatoes almost daily and destroyed the old beetles. The leaves were also carefully examined and all eggs destroyed. We wanted to make our work thorough—to test the utility of this destruction of the parent beetles. Nevertheless the grubs appeared in quantities never before so great. These were destroyed by London-purple. This year there are more old beetles—two to one—than ever before. They ate the shoots when, and as, they *first* appeared. But in a few days they began to mate, and then ceased to eat. At this writing our vines are "alive" with old beetles, and the orange clusters of eggs appear on many leaves. We shall wait a few days until the eggs are mostly hatched and then shower the vines with Paris-green or London-purple. We believe that this is the easiest and most effectual method of dealing with the potato beetle. The theory of destroying the parent beetles seems quite reasonable. The RURAL has given the same advice for years. The fact is, however, they cannot be destroyed by poison because they eat so little, and hand-picking, if ever so thorough, seems scarcely to lessen their numbers, while it takes an amount of time which farmers cannot afford.—EDS.]

IN a recent ride on the Central Railroad of New Jersey to Trenton Junction I was surprised to find, between Elizabeth and that place, not more than half a dozen apple orchards in sight from the cars. The peach seems to be considered more profitable. Of corn there is no end. Potatoes are also largely grown, and in every field I saw boys and girls engaged in picking beetles in tin pails. This is better, if not cheaper, than Paris-green, London-purple or any other dangerous poison. The boys and girls are paid so much a quart for the season, and, I was told, do the work thoroughly. Wheat is more common than rye along the road, and looks well, except some fields on low ground, which looked patchy from winter-killing. I saw very few oats. Dairy farming and the breeding of choice cattle seem to be greatly on the increase. Mr. Farley has recently purchased a fine farm near Trenton, in addition to his farm at Cresskill, and has just added some choice animals to his fine herd of Jerseys. I find this to be the favorite breed of cattle in this part of the country.

MUCH has been said, and justly, in praise of the superb roses grown at Madison, N. J.; but even the Madison roses have not surpassed, except in quantity, the splendid roses grown at Baronald, Orange Mountain, the beautiful residence of Mrs. William Barr. The Niphetos and Perle des Jardins were simply the finest I have yet seen. The Maréchal Niel blooms, too, were very large and as pretty as pictures, and fine ones at that; besides, they were grown on *old* plants, and that is the point I wish to bring out. Complaints of the fickleness of the Maréchal come literally from all parts of the world, and have for years. It surprises me, however, that it fails so soon in our Southern States, rarely surviving a few years. The cause I do not propose to discuss just now. I will state my belief, however, that our Southwestern friends will never succeed with it as an outdoor plant.

I wish to state briefly the manner in which the Niel is grown at Mrs. Barr's, which may be useful to rose-growers generally. Having two old plants of Lamarque, they were budded near the stock with Maréchal Niel. The buds took kindly, and the growth was everything that could be wished for, without being rampant. The growth has remained healthy and the flowers have been abundant, large and perfect. I counted 142 expanded buds the last time I saw the plant, and a basketful had been cut the day before. The house is not large, but it has a natural earth floor, with an abundance of moisture, and a temperature somewhat above that of the average greenhouse. The pitch of the roof is low, and the plant is trained about 20 inches from the glass. On a leading shoot of one of the Lamarque plants buds of the Niphetos were put in about 20 inches apart, took well, and produce splendid flowers of that fine rose in the greatest abundance. Further along on the same shoot buds of the Perle des Jardins were more recently put in, and have done even better than the Niphetos. As I looked at the flowers produced from these buds I thought the Perle one of the most beautiful roses I ever saw. Here, then, are two roses commonly thought to be intractable (the Niel and the Niphetos) growing in a most acceptable manner grafted on the Lamarque, the Niel being quite free from the ordinary slow decay which often overtakes it while still young, and the Niphetos blooming in quite an off-hand manner. It is no new thing, of course, to bud roses in this way; but the experiment of the Niel on an old but healthy Lamarque, with abundant moisture from the natural soil, and something more than the common greenhouse temperature, is worth a trial by all lovers of that splendid rose.

THE Styrax Japonica, I am very sorry to say, was killed to the snow line last Winter. It is so really handsome in all respects that I had hoped it would prove to be hardy during our coldest Winters; but 19 degrees below zero seems to be a little too much for it. Below the snow line it was not injured in the least. I should like to hear from others in regard to the hardiness of this fine shrub, for I am very loath to give it up.

I HAVE seen no shrub this season more beautiful than Exochorda grandiflora (Spiræa grandiflora of some catalogues). It is not only beautiful, but stately and picturesque. It should be better known than it is. I find but few who have ever heard of it. Why will not nurserymen try to overcome the difficulties of its propagation, and put the price down to a reasonable figure? I know it can be grown from the green wood; but the rule is now too common to grow only those things which can be propagated easily, and this may be because people are unwilling to pay for a little extra trouble.

AT Newburgh the Cercis Japonica, I find, is not quite hardy in a Winter like that just past. C. Siliquastrum was unharmed. C. Japonica, with me, had an inch or two of the last growth killed, but in other respects was uninjured, and flowered as grandly as ever. It is a little beauty.

I HAVE at present about 150 varieties of strawberries, and of these the Garden will be the first to ripen, Burr's New Pine the second, and Erebus the third. I have at this time (June 6) berries on each of them nearly ripe. The Duchess, about eight feet off, has not yet begun to color. The Bidwell, right beside it, looks as if it might ripen first. The Bidwell, by the way, is showing an immense crop. But wait a few days.

THE Cuthbert and the Montclair have now (June 6) only a few flowers ont. The Caroline, near by, is nearly done blooming, has berries as large as Marrowfat Peas, and is a mass of fruit from the ground to a hight of nearly eight feet. The New Rochelle is not much behind it.

I WROTE "delicious Teltow Turnip," not *yellow* turnip. The Teltow is not that kind.

HORTICOLA.

GARDEN HINTS.

I FIND eternal vigilance is the price of success in gardening. The turnip fly has done more damage to my cabbage plants this year than ever before, and I have to keep them well dusted with wood ashes. I raise cabbage plants to sell, and furnish most of the farmers in this vicinity. For varieties, I sowed this year one ounce of Early Winningstadt, two ounces of Filder's Kraut, four ounces of Fotler Drumhead, four ounces of Premium Flat Dutch. This I consider a very good list of varieties. Cabbage plants are greatly improved by being transplanted into other beds, three or four inches apart. After being so treated they may be taken to the field and set out almost as well in dry as in moist weather.

I have just finished brushing peas, and I am not sorry. I have what would make a continuous row 240 rods long, all thoroughly brushed. It was quite a job to brush them, but it will pay in the picking alone. For varieties, I planted 24 quarts of Laxton's Alpha, 12 quarts of Champion, and 6 quarts of Yorkshire Hero. By the way, these last are a very fine pea. They grow about three feet high, with very strong vines, and require but very little brush, and for quality they are unsurpassed. For brush I use mostly beech, as this is usually fan-shaped. I set the brush on each side of single rows. I have not found double rows desirable, as in that case the peas are not usually planted deep enough. Peas should be planted at least five inches deep, and the soil left light upon the seed—not pressed down as in case of shallow planting; and if from heavy rains the soil becomes crusted before the peas are up, a rake may be drawn lengthwise of the rows with benefit. ADELBERT WAKEFIELD.

Oneida Co., N. Y.

[Several years ago we tried the experiment of planting peas at various depths from one to six inches. Those planted at a depth of three inches were most productive.—EDS]

Field Crops.

ABOUT POTATOES.

E. WILLIAMS.

Top, or Eye Ends, versus Butt, or Stem Ends.

SOME people assert that there is no difference in the yield of either end; others are equally positive to the contrary; others, again, go so far as to reject the butt ends as useless, regarding the eye or top end only as fit for planting. I have tested the matter several times during the last dozen years, chiefly with Early Rose and Ohio, and the results have always been in favor of the butt ends, yet I should not discard either end as unfit to use.

Seeing a statement last Spring by some would-be authority to the effect that there was no difference, or, if any, it was in favor of the top ends, induced me to try once more to prove the correctness of my position. I used Early Ohio and Beauty of Hebron with the following results, as my notes show:

The butt ends were ahead in strength and vigor the season through. The difference was so apparent that any one could see it at a glance. On the first trial of the Ohios the butt row gave the best yield. Again, July 28, during "Horticola's" visit, further trial was made for his inspection, with the same result. On August 4th a part of the butt end row gave 51¼ pounds, while the same length of the top end row alongside gave 41 pounds—a further confirmation of all previous trials, so that I am willing to regard the fact as established respecting this variety at least, and I am not ready to except the Early Rose until an equal number of trials result differently.

Now comes the Beauty of Hebron which seems to take the negative side of the question. On August 24 the same length of rows as of Ohio were dug alongside the latter, the butt row giving 74 pounds and the top row 81¾ pounds. Again, on September 13th an equal length of Beauty of Hebron rows was dug with the following results: butts, 63¾ pounds; tops, 65 pounds, the excess in each case being in small potatoes. With this variety the difference is slightly in favor of the tops and if further trials should result similarly it would seem that varieties vary in this respect and this may account for the different opinions entertained in this matter. The facts are valuable as *facts*, even if unimportant in other respects.

I have grown the Early Ohio ever since its introduction, even before it was christened (it was first sent out as Early Reese or Reese's Early), and I have yet to find a better early potato or an earlier one. It lacks productiveness with me, but there are comparatively no small ones. Some have claimed that it is as productive as the Early Rose or more so, but I do not find it so. The Beauty of Hebron is nearly or quite as good, not quite as early but more productive and a valuable acquisition. Thanks to the RURAL for doing so much towards disseminating it. I hope the White Elephant will prove as valuable, but "Jerusalem!" what a name for a potato; it is a load to carry of itself. I suppose thousands of RURAL readers are in a fair way to realize what it is to have an elephant on their hands. Potato bugs are unusually numerous. Fight them *early* and *often*; to destroy the first crop of beetles is the *most important* step, as they are the advance guard and main army combined.

Montclair, N. J.

CORN FERTILIZATION.

A NOTE on page 341 of the RURAL attracts my attention somewhat. It is with reference to the pollenation of corn. It is very difficult to show how so many varieties intermix. It can be clearly and easily shown how three or four standard (fixed) kinds may mix and how the tassel of a single stalk will produce no grain unless fertilized by the pollen of another.

Corn is monœcious—having the staminate (male) and pistillate (female) in different flowers on the same plant. If one kernel each of a standard white dent, yellow dent, sweet and pop corn be planted close together and all

tassel and silk at the same time, I venture the assertion that there will not be a grain found in their progeny exactly like either of the four grains planted. I further assert that the tassel of no single stalk will fertilize its own silk, or, in other words, no corn can be produced with less than two individual stalks.

I have made almost every conceivable experiment on corn and have proved the truth of such assertion beyond a doubt. By covering one ear with muslin until the silk is fully developed and then putting the pollen of its own stalk upon it, it has in eight different experiments produced no grain at all upon the cob. On the other hand, by putting upon selected ears a liberal supply of pollen from other stalks, ears of the finest type are invariably developed. Often it is for the want of pollen that the lower ears of the stalk do not fully develop. PROF. A. E. BLOUNT.

WOOD REED-GRASS (Cinna arundinacea).—This is a large perennial growing in moist woods and shaded places, attaining a hight of four to seven feet. The panicle is six to fifteen inches long, and is well shown in the drawing. I removed a small quantity of the roots to dry, sandy land which is moderately fertile. The grass there grows about three feet high and looks rather harsh and of poor quality, somewhat like most of our species of bromus. It has not been tested to determine its nutritive qualities; but, judging from the way the grass is allowed to grow where cattle have access to it, I should not place a high estimate on it.

PROF. W. J. BEAL.

Farm Topics.

A MISTAKEN IDEA.

A GOODLY number of people get an idea either from reading descriptions of farming out West or from a too hasty personal inspection, that farming can be made a success far more easily here than in older and thicklier settled States. This may be true in some respects but in others it is not nearly as true as one would suppose. As a rule, Western farmers practice mixed farming, except in the Far West where stock raising and feeding are followed exclusively. This is as a general thing a necessity, made so by the lack of facilities and opportunities for disposing of a large stock of any one sort of grain; and a disposition on the part of the farmer to raise on the farm as much as he can of the food of all kinds used in the household. With this idea he keeps sheep for their wool out of which his wife and daughters spin yarn and in many cases weave the cloth for the coat and pants he wears and which are made at home. He keeps cows for milk and butter; geese for feathers; hogs for meat to eat; wheat for flour; corn for stock and for meal; for very few Western farmers will consent to eat many meals without corn bread. Oats and hay he raises for stock horses to ride and cultivate his land, while he invariably tries to raise sufficient garden truck, such as potatoes, beans, turnips and the like for his own use. He has but little money because he needs but little. He raises all he eats and wears, and he needs very little money for any other purpose. A great deal of what he purchases from the store is paid for in what surplus stuff he has over and above what will feed and clothe his family.

A man unaccustomed to this way of living, who has always been in the habit of selling the products of his farm for cash and then buying from stores what articles are necessary to his comfort, whose wife knows nothing of spinning or weaving, thinks the average Western farmer has learned nothing and imagines he can come out West and farm just the same as he did at home and make it a success. He imagines he is going to show Western men how to farm, and knowing nothing of the relation of supply and demand and of the difference in market prices caused by being close to a good market and being obliged to haul fifteen or twenty miles to market, he fails to make money as fast as he expected; gets discouraged; is ready to sell out and go away to some other promised Eden. I do not by any means claim that in all things Western farmers are perfect; but our experience proves to us that what will do in one section of country will not do in another, and the man who comes West must expect to find some things different from what he left behind. And, most of all, he must not expect to farm successfully without hard work both physical and mental.

There is no doubt that to some extent money can be made more easily here where land is cheap and rich than where land is high owing to competition for it, and poor, owing to long-continued cultivation without due regard to returning to the soil at least a part of the fertility taken away in the crops. Still more, however, could be made if the same pains were taken here to farm closely as are taken in the older States. Simply because a man can make a little money by farming in the careless, slipshod manner that too many Western farmers practice, that is no reason why the farmers should not make more, and considerably more, by following in many respects the experiences of farmers in the older States.

Miller Co., Mo. N. J. SHEPHERD.

MELILOTUS AS A GREEN-MANURING PLANT.

C. E. THORNE.

FOR several years I have noticed that some thrifty plants of Melilotus alba were the sole occupants of a plot of clay subsoil as hard as the floor of a brick-yard, from which the surface had been washed away, but the peculiar significance of this habitat was not impressed upon me until during a recent drive over a newly made road, I saw this same plant growing upon the bare clay of the road-side, whence the soil had been scraped in making the road-bed, and where even White Clover was making but a scant living although the melilot was already twice as tall as the Red Clover on the fertile soil of the neighboring field.

This plant—otherwise known as Bokhara or Sweet-scented Clover—has become naturalized here at a comparatively recent date, but has long been known as a forage plant both for cattle and bees, being well adapted to soiling, as it makes a growth of four to six feet during the season and is said to bear two or three cuttings; while its sweet-scented blossoms afford a favorite pasture ground for the honey gatherers. The German analyses give to its hay a feeding value of $15 per ton, against $16 28 for "very good" Red Clover hay, while its habit of growth is such that I should expect it to yield a much heavier crop than Red Clover.

WOOD REED-GRASS—CINNA ARUNDINACEA. —FIG. 301.

But without discussing the value of the melilot as a forage plant, the observations I have noted indicate that we may possibly find in it a counterpart of the Southern cow-pea as a recuperator of exhausted soils, and at the same time find it better adapted to our climate and circumstances than the cow-pea. As it grows much more rapidly than Red Clover, whether from the seed or from the root, and seems to thrive so well on sterile soils, apparently growing by preference in such places, it would seem well worthy of trial as a green-manuring crop.

A further reason for a more general examination of the merits of the melilot than has yet been made in this country, is the probable failure of the Red Clover from the depredations of the European clover beetle, which, according to the statements of Professor Barnard, in the report of the Cornell University Experiment Station, is already threatening the total destruction of that crop in some sections of New York.

Ohio State University.

The Herdsman.

FEEDING YOUNG CATTLE.

PROFESSOR J. M. SANBORN.

IN the East soil feeding is a positive prerequisite to successful farming. We have open to us two grand sources of materials for soil fattening—the animal and the chemical. Growing experience and extended inquiry lead me to rank very high the influence that chemicals exert in developing the prosperous era in Eastern farming that is on the eve of being ushered in, to stay; yet of these two sources, that furnished by our domestic animals is the greater; that is, the better and the cheaper source. Both must be used, but the better the more freely. I would advocate more feeding and better management because in the older-settled States cheap crops rest upon cheap manure, cheap manure upon cheap beef, and cheap beef upon skill. The grand essentials in stock breeding for meat products are, the right animal, warm quarters, early maturity, a daily sufficiency, and no excess, of each constituent of animal growth, and feeding rich manure-making foods.

Feeding the Calf.

A look into the chemistry of the calf reveals the fact of rapid development of muscle and bone in the young beast. The foods commonly fed by the better class of farmers to the young calf are well calculated to supply all its wants. Early, but gradually changed from new milk to skim-milk, supplemented by easily digested mixed meals in small quantities, it makes a cheap growth, and may even be thus fed till it has attained a weight of from 300 to 400 pounds and kept fat and fit for the market. In the mid-winter of 1879, I grew two calves in this way on skim-milk and grain after they were three weeks old, and in 87 days they had attained a weight of 355 pounds at a cost of three cents and one-fiftieth of a cent per pound, while they were salable at four cents per pound for veal. I call attention to this because to raise calves in this way is more profitable than to keep them on new milk till four weeks old and then sell them for veal. It is not my purpose to discuss here the best methods of feeding the young calf, but I wish to insist that for the best profit the Spring calf must come to the barn with a minimum weight of not less than 400 to 500 pounds. In order to do this, the calf must be kept near the house in a special lot where it may receive either skim-milk or grain, not corn-meal, however. It is generally after passing out of early calfhood and into older age, and as one-year-olds and two-year-olds, that the better class of farmers (those most likely to read a paper devoted specially to agriculture) make the mistakes that interest me now in writing this article. I constantly meet good farmers interested in feeding problems, that feed grain according to the weight of the animal; that is, I find many who are trying to make straw, swale hay and corn fodder equivalent to good hay by adding food rich in flesh-makers, and in doing so they would give to a two-year-old nearly twice as much as to a year-old, and feed an ox at rest in the stable upon a little better hay than that given to those growing and a little more grass. This practice is all wrong. From a table compiled by Wolff and given in Prof. Armsby's Manual of Cattle Feeding, facts are stated as follows:

	Steer.	Calf.
Fat	26.3	13.1
Proteine	13.7	15.3
Ash	3.9	4.5
Water	44.6	60.1
Contents of intestines and stomach	12.0	7.8

Theorizing, one would say from this table that the younger the animal the larger the ration of albuminoids, or flesh-formers, required in the food. Theories invite, but facts force belief. German feeding trials find for the calf a ratio of one of albuminoids to five of carbhydrates, varying from this standard according to weight. As the age and size increase, the ratio required widens until one to twelve is found to answer for a mature ox at rest. The translators of Wolff's tables report a requirement of one and one-quarter pound of digestible albuminoids daily for a 500-pound steer; 1 4 pound for a 700-pound steer; 1.36 pound for an 850-pound steer, and seven pounds for a 1 000-pound steer at rest. I have before me an analysis, by Prof. Collier, of corn fodder that I am feeding to animals varying in weight from 500 to 1,000 pounds each. The 500 pound animal, I find, will actualy consume from 10 to 12 pounds daily of this corn fodder, that will furnish .36 pound of the digestible albuminoids actually needed. I am feeding, as a complementary food, cotton-seed meal whose analysis I know, and to furnish the theoretic amount of albuminoids still needed will require, in addition, 26 pounds of this meal daily. My 700-pound steer will consume 15 pounds of corn fodder, giving .46 pound of digestible albuminoids. To make up the theoretic amount he will want three pounds daily of the meal. The 850-pound steer consumes 18 pounds daily, giving .55 pound of digestible albuminoids. To complete the amount required will call for only 2 6 pounds of cotton-seed meal, while if we were to consider the 1 000-pound steer to represent an ox at rest, such as many farmers practically have in the Winter, the corn fodder would alone very nearly supply the muscular waste going on; or, if he was growing, he would still require only substantially the same amount as the growing calf or one-year-old.

Practically, in feeding, animals of different ages and weights require substantially the same amounts of concentrated food for growth. The saving of the better hay from older stock and feeding it to one-year-olds or two-year-olds is the reverse of the correct process. The older animals require a relatively large amount of carbhydrates, as seen by analysis and practical feeding trials, and the poorer classes of food, like straw, swale hay and corn fodder, are relatively rich in these materials. Our chief concern in feeding young animals when these poorer foods are given is to furnish rich flesh-formers within the ration given. I have decidedly come to the opinion—but it is hardly more than an opinion—from what facts I have gathered in experience, that the ratios for this country, with its cold Winters, need hardly be so narrow as those found necessary in Germany. If it should prove so, then it would give more emphasis to the points to which I call attention. If environment affects animal growth, then we have a cold climate, and our natural fodder, the grasses, analyze very much wider ratios than do German grasses, as though nature was anticipating cold Winters, and pro-

viding a heat-supporting food. Be that as it may, our better grasses analyze only approximately one of albuminoids to ten of carbhydrates. This for our warmer barns is certainly not the best ration for a growing young animal. So that for the best results, even with good hay, additional grain is needed. This grain must be nitrogenous, not corn-meal, always so tempting to use, for even if fed wholly it would furnish a narrower ratio than is required for the younger animals; hence it could not afford the best theoretic ration, nor the best practical ration either. This I have demonstrated by the careful feeding of sets of steers with weighed hay and grain for two Winters.

The question of profitable feeding does not hang so heavily upon the hay supply as formerly supposed, as it is rather a question of so much albuminoids, carbhydrates, fats and ash. We are left free to get these materials from such sources as we may find cheapest. I have tried, by the scales, many combinations cheaper than hay, made up from cotton-seed meal, blood, meat, fish, bran, clover hay, or rich nitrogenous foods with straw, corn fodder and swale hay. Thus I have just ended an experiment with four heifers, weighing, in round numbers, 600 pounds each, for a period of 66 days. They have gained 97½ pounds each, only a fair gain, but it required a ration of corn fodder and straw, of which 12½ pounds each were eaten, two to three pounds being left for bedding, and three pounds mixed cotton-seed and corn-meal (had the corn-meal, and the common weakness to use it), ratio, one to eight; cost of corn fodder, $7½ per ton (say for 14 pounds, charging for one-half of fodder left for bedding), and meal at $25 per ton, making a total of 8 3 cents per day. For a growth of 66 pounds in 66 days, 15 pounds of hay per day would have been required, at $15 per ton, 11¼ cents, or if the comparative value of the straw or corn fodder by the side of hay is sought, these fodders would bring over $11 per ton and make better growth. I can give from my record of experiments abundance of similar results.

I will add that in several experiments clover and straw have given as good results as good hay. The best of clover hay is nearly twice as rich in flesh-makers as Timothy hay, and I find when I mix three parts of clover hay to two of oat-straw, that the mixture is as efficacious as all clover hay or all good hay. This fact alone, when properly used, should make very much difference in the case of steer growth. Both foods are home-grown and within the reach of all. So valuable have these coarse foods proved with me, that I am entirely changing my system of farm management and introducing a broader system of tillage crops, and can commend it to Eastern farmers; for large results only come of large operations.

Recurring to hay rations, or hay and corn-meal rations, for the purpose of a suggestion, I note that careful inquiry will reveal the fact that for the growing steer neither much of our hay alone nor hay and corn-meal will furnish phosphoric acid available in sufficient quantities for a rapid-growing animal. Under such circumstances the best results cannot be expected. Almost any other grain or meal with the hay would furnish enough of phosphoric acid for bone construction. I am confident of the statement—but for the present I must rest on assertion—that beef can be grown in the East and pay market rates for foods, except round the centers of high prices, and that the farm animal is our cheapest source of plant food.

College Farm, Hanover, N. H.

Management of Working Cattle in the Spring.

Do not turn them out to grass till all the heaviest part of the Spring and early Summer labor is finished, as it is more necessary to keep working oxen strong and in good condition at this season than at any other throughout the year. The only way to do this is to keep the cattle in a stable or in a dry yard with good shed shelter, and feed them, as during Winter, on hay and meal. There is little nutriment in grass at this season. It is so succulent it scours cattle and otherwise weakens them, rendering them unfit to do a fair day's work, even if their ration of meal is continued to them.

After the heaviest labor is over, and the grass has become more nutritious, cattle may be turned on to it by degrees, say a half hour or so the first three or four days, then gradually increase the time daily till they can remain entirely at pasture. It is advisable to also continue the meal with a gradual daily diminution or not, according to the work required. In the course of a few weeks, if the labor is light, cattle will do well enough on pasture alone, provided there is plenty of it and of a good quality.

THE PREAKNESS FARM THOROUGHBRED SALE.—The annual sale of yearlings at Preakness Farm, owned by M. H. Sanford, near Lexington, Ky., on May 26, resulted in the sale of 38 head of the get of Virgil, Glenelg, Monarchist, Ten Broeck and other good sires. Eighteen colts sold for $17,050, the average price per head being $947. Of these 18, there were seven by Glenelg, and they brought $9,240; five by Monarchist sold for $2 600; two by Virgil went for $4 200; two representing the great Ten Broeck went under the hammer aggregating only $810, and lastly a Baywood and a King Lear declined to $100 each. The average on fillies was a fraction over $400, the full amount for 20 of these disposed of being $8 025. It appears that three out of the 20 in question were by Glenelg, and they sold for $995; the seven by Virgil sold for $3 550, and the ten by Monarchist for $3,470. The amount received for the 38 head disposed of was $25,075. Most of the purchases by Col. Bruce were for James R. Keene.

THAT ANTI-SELF SUCKING DEVICE referred to in the RURAL of May 21, is an old contrivance. In a late issue our esteemed contemporary, the Country Gentleman, says that it was described in its Illustrated Annual Register ten years ago, and very naturally objects to our crediting its origin to Professor Sheldon's Dairy Farming, where it was described as a device employed in the neighborhood of the writer.

We have just received a note from T. B. Garoutte, of Fannin Co., Texas, who says: "That device for a nose-piece is not at all recent: I have used it for 50 years and my father used it in New Jersey long before."

RELIEF FOR CHOKING CATTLE.—Apropos of several ways of relieving choking cattle, mentioned in a late RURAL, our friend, C. A. R., writes us from Perrysburg, N. Y., that a safer and better way than any there alluded to, is to pour from half a gill to a gill of oil—sweet oil, castor oil or linseed oil—down the throat of the afflicted animal, having first turned its head up to facilitate the operation. As soon as it reaches the obstruction, relief is instantaneous, as the apple, potato or whatever it may be, can be easily swallowed or ejected along the oiled passage.

Dairy Husbandry.

THE DAIRY COW. NO. 34.

HENRY STEWART.

Care of Pregnant Cows.

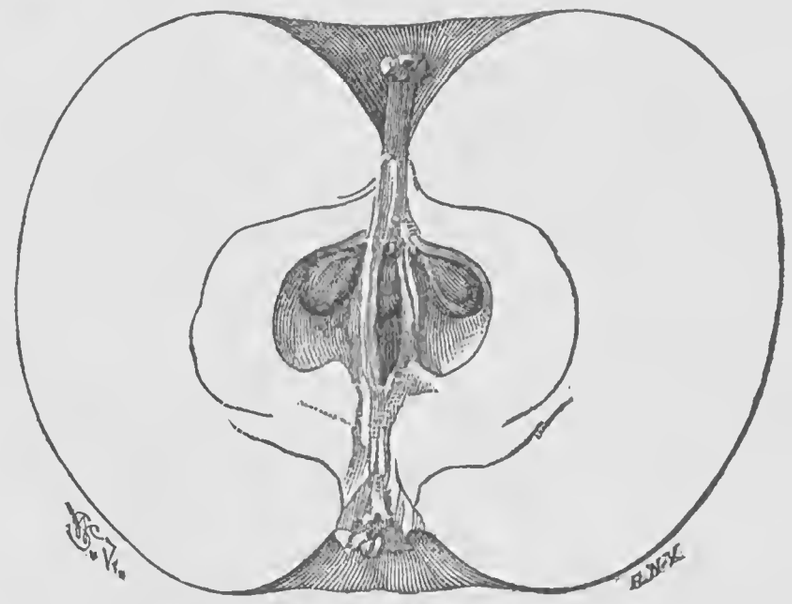
(IN the preceding article by some oversight some errors were made which should be corrected. In the second column, 4th line from the top, page 367, the word bull was intended to be male. A few lines further down, in the summing up of the results of breeding in the second flock mentioned, the aggregate should be 54 (not 55) males, and 31 (not three) females. How the one should have displaced itself and played such tricks with the matter is a wonder beyond explanation. As regards the diagram of the bull yard, the following references were omitted. The bull yard is at A with the stable connected, having a feed trough and partition five and half feet high and a feed passage opening from without; so that the bull may be fed and watered without the attendant being obliged to enter the stable or yard. The cow stable is at B; the cow yard at C, the water trough at D; this smaller yard is separated from the larger one by a gate; *g, g, g*, are gates for driving in or out of the yard.)

The greatest and most frequent troubles in dairy herds are with the in-calf cows; and special care and management are required to carry the cows through this period. Soon after a cow has become pregnant the milk yield generally begins to fall off, and it has been supposed by some persons that the escutcheon has something to do with this habit; or the habit has something to do with the escutcheon; which is which, however, has not been made very clear. The dairyman has to deal with matters of fact and not of fancy, and the whole business regarding the escutcheon in this connection may be discarded as not of practical value to him.

Feeding has much more to do with the milk yield than the direction which the hair upon a cow's hind legs may be apt to take, and it is beyond reasonable doubt that much of the decreased milk yield is due to a neglect to increase the cow's ration of food in proportion to the new demands upon her productive powers, or the new direction which they are made to take. How much food the condition of pregnancy exacts is not by any means certain and varies very much in different cows; but I am inclined to believe that it is very considerable and more than would be needed if only physical requirements were to be met. But nervous force consumes a much larger proportion of food than mere vital or muscular force, and as the nervous condition of a cow is greatly modified by her state of pregnancy, the more food will be required to maintain the flow of milk while in this condition. Recent careful experiments with two cows have convinced me that the continuance of the full milk yield in pregnant cows is greatly a matter of feeding. Two cows whose records were strictly kept last year and the present, and which gradually fell off in their milk yield last year from their becoming in calf, have this year not yet fallen off at all and one has considerably increased under more liberal feeding. The increased consumption of food is from 25 to 50 per cent and the latter increase has enlarged the milk product a little more than one-fifth. The cow which gave 26 pounds of milk daily very steadily for three months after calving, has increased to 32 pounds after having been a month in calf, with an increase of three pounds of meal and 15 pounds of grass. Some of the increase may be supposed to be due to the better condition of the grass, but the increase of butter is still larger in proportion, and the effect of the grass seems to have been exerted chiefly in the production of cream. Another cow six months in calf still gives more milk than immediately before service at which time she had been nearly six months milking. Her extra allowance of feed is also three pounds of meal and 15 pounds of grass: when on dry feed the extra hay given was five pounds, an addition of 50 per cent on the previous quantity, which was but 10 pounds daily, with eight pounds of meal. As this cow progresses in her pregnancy her eagerness for food is quite remarkable, and although before a very quiet cow she is now very noisy until her feeding is attended to. These cows are fed in the barn wholly and their food is accurately measured to them.

It seems to be reasonable that a pregnant cow should require more sustenance than in her previous condition; and while from want of sufficient experience in this direction, having but recently given close attention to this matter, I cannot as yet determine with any precision what the amount demanded may be, yet I feel confident that dairymen will find it to their interest to study this subject with some degree of carefulness, as it is of much pecuniary importance to them. The family cow especially should be studied in this respect, because a steady flow of milk is very desirable where but one cow is kept.

The general management of a pregnant cow should be such as to keep her free from excitement; safe from violent accident; to give her ample exercise when not at pasture and in such cases to provide a yard in which she may spend a portion of her time. The greatest risks of danger are from falls, from sudden attacks by dogs, from exposure to infection from aborting cows; from congested and inflamed udder caused by chills from exposure to sudden rain storms after severe heats, and from exposure to the sun's intense heat without the protection of some shade. The great bugbear of the dairyman is abortion, which is becoming seriously prevalent, and which may be produced by any of the causes above mentioned. One more source of danger may be referred to, and that is the use of stanchions. A cow confined in stanchions can rise only with a great effort in which severe strain is thrown upon the muscles of the loins and abdomen. If a cow thus confined, is watched as she struggles to rise when hampered and held down by the stanchion, the dangerous character of the muscular strains will be readily seen. It will be a safe and profitable arrangement in every dairy to provide a few separate pens for the accommodation of cows about to calve, to which they may be removed as soon as they are no longer milking; and to either provide a separate yard attached to these pens or to let these cows into the general yard only when it is vacated by the others.



THE GARDEN APPLE.—FROM LIFE.—FIG. 302.

Pomological.

THE GARDEN APPLE OF WESTCHESTER CO., NEW YORK.

PETER B MEAD.

SIZE, medium to large. Form, oblate-conical. Color, pale yellow when ripe, occasionally with a pale pink cheek in the sun, and small red dots at intervals over the surface. As apples are usually described, the skin would be said to be a little clouded; but as this clouding is usually done by flies, it is just as well to omit it. Calyx closed, in a moderately small, slightly wrinkled or corrugated basin. Stem very short and stout, inserted in a small cavity, which occasionally shows a distinctly formed nipple. Flesh, yellowish white, exceedingly tender, nearly sweet, with a peculiarly agreeable flavor, which is rather spicy than otherwise at the beginning of the season. Quality nearly or quite best. Season from October to the beginning of March.

This is a valuable addition to a small class of apples which are too much overlooked, and of which the Primate is an excellent example. I allude to those apples which, besides being agreeable to the palate, are also tender-fleshed and easy of digestion, and might very well be designated *food* apples. They are peculiarly acceptable to those whose mastication and digestion have become more or less impaired by age, and who find it difficult to eat or digest such high-flavored but tough-fleshed apples as the Newtown Pippin or the Spitzenberg. By-and-by we shall come more and more to regard the apple and other fruits from the stand-point of food, and a greater and juster value will then be put upon tenderness and digestibility.

The Garden Apple is not only excellent as a dessert fruit, but is one of the best for baking and other domestic uses. I know of no apple of its season that I prefer, and I seldom eat any other when I can get it; and its local reputation is such that very little of it finds its way to the open market. The tree is a vigorous grower, of an upright rather than a spreading habit; but the growth being rather slender, the branches become somewhat pendulous from the weight of the fruit.

There are two or three apples known by the name of the Garden Apple, but they are quite distinct from the one under consideration, which thus far is a local apple, now for the first time described. It is a native of Westchester Co., N. Y., and its origin goes back more than a hundred years. It is an apple well worthy of cultivation.

The Kieffer Hybrid Seedling Pear.

I was very much surprised by the statement in a late RURAL to the effect that the last severe Winter had not harmed the peach blossoms in the least at the Rural Farm, and that "the Kieffer Hybrid Pear was killed to the ground." This is just contrary to to my experience. Here and almost over the whole peach region of the United States the peach buds were frozen in the Winter except only on elevated ground or hills. With me not a peach or an apricot flower was seen, yet my Kieffer pear tree was not injured in the least. I have had the Chinese Sand Pear, or "Sha Lea," off and on for about 48 years, having lost it three times by cold Winters, but as I had given grafts to several friends who live on high ground, I have each time been able to recover it. Thus I now have the original "Sha Lea," and six crosses of it; not one of them was injured further than having their flower buds killed, and all are now growing vigorously. My Kieffer Hybrid is only a graft of last Spring, and so is the "Le Conte," the "Japan" and the "Cincinci," but the Japan variety even had some flower buds uninjured and now has a few pears. J. B. G.

KIEFFER HYBRID SEEDLING PEAR, obtained from Mr. Parry, Cinnaminson, N. J., was planted here a year ago, and is doing well. No pears on the premises look better. J. C.

Matapan, Mass.

BEST TIME TO PRUNE FRUIT TREES.—Various opinions exist as to the proper time for this work, but I wish to give RURAL readers the result of my experience and observation. A few years since I began pruning a large orchard of young trees in February, and got through with about one-fourth of the orchard during that month. Owing to a pressure of other work the remainder of the orchard was neglected until a year from the next June, when I finished the whole. Now at the end of two years from the latter time, the trees which were pruned in June are more nearly healed over where limbs of from three-fourths of an inch to two inches in diameter were taken off, than those trimmed in February, more than a year earlier, and I have noticed similar conditions at other times, proving conclusively to me that June pruning is preferable.

Croton, N. Y. E. J. BROWNEL.

Veterinary.

INTERNAL PARASITES OF THE BOVINE SPECIES.

It may perhaps be a surprise to those persons who affect a dislike to pork on account of the numerous disagreeable parasites and the many diseases the pig is heir to, to learn that the ox is as subject to these troubles and ailments as the pig. The ox, in fact, becomes the host to numerous internal parasites, some of which are exceedingly injurious to the health of mankind, and others are destructive

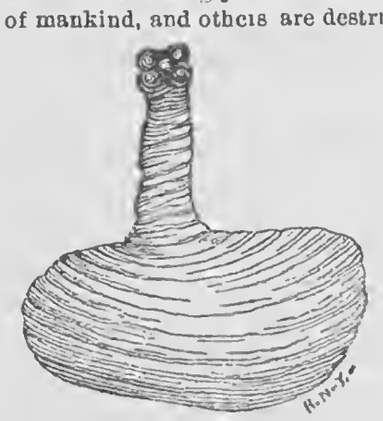


FIG. 303.

to its own existence, while it has its share of external parasites which annoy it and cause trouble to its keepers. Of these parasites some are vegetable but the most serious of them are animal. To describe all of these would occupy more space than could be here spared, but an enumeration of the most important of them and a description of some of them may be useful and interesting.

To begin with the most minute of these, we may mention the microscopic parasitic organisms which have been called "cattle-plague bodies," and which, infesting and disorganizing the blood, produce those specific febrile diseases which devastate our herds. Each of these diseases seems to be caused by a distinct organism, but all of them have a generic likeness. They belong to the class of unicellular vegetation which has the power of a most wonderfully rapid increase by the bisection—

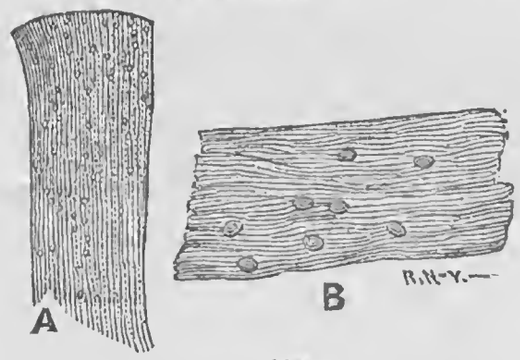

FIG. 304.

so to speak—of the cell and the production from it of two separate cells, which, in their turn, bisect and again separate *ad infinitum*. Anthrax fever, the well known Texan or splenic fever, rinderpest or the popularly know "dry murrain," the cattle plague of Europe as well as of our own plains, apthus fever, the frequent foot-and-mouth disease, happily very little, if at all, known here, and not indigenous in its virulent form; contagious pleuro-pneumonia; cow-pox; malignant anthrax, the too common "black leg," "black quarter," or carbuncular erysipelas which destroys so many calves and young cattle; tuberculosis or scrofula, and, lastly, epizootic abortion; all these are the effects of these minute but disastrous germs which are almost indestructible by time or chemical agents, and whose germs float in the air and are carried on the wings of every wind, washed to the earth by every shower, floated on every stream, and are even carried through the very earth itself by the waters of the springs. Ever-present, they are a constant threatening and danger to our cattle, and at times, when circumstances favor their development, they become enormously destructive, slaying hundreds of thousands of cattle, and ruining thousands of persons at one fell swoop.

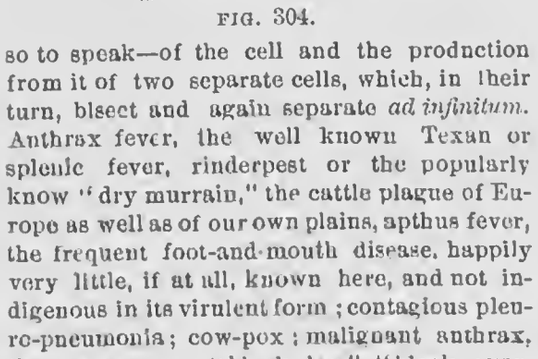

FIG. 305.

No less destructive if unchecked, but more amenable to treatment, are the animal parasites which infest the lungs and air-passages, the kidneys, the heart, the liver, and the flesh of the ox. The so-called thread-worm—*Strongylus micrurus*—or small-tailed strongle, is chiefly destructive to calves, causing the disease known as husk, hoose or "worms in the throat and lungs." This worm is prevalent in all parts of the country, and causes much loss among calves and yearlings. The mature female measures three inches in length, and the male half as much. Both sexes infest the bronchial tubes of young cattle and cause death by blocking up the air-passages, as they gather in knots and masses surrounded with frothy mucus. Various unsuccessful remedies have been proposed for this pest, but the only truly effective one seems to be the inhalation of chlorine gas made by dissolving salt in sulphuric acid in a close room.

Four other species of strongle infest the ox. S. ventricosus occupies the small intestines; S. inflatus is found in the large intestine; S. radiatus infests the gall ducts; and S. gigas is found in the kidneys. These parasites are also found in other animals, notably in the sheep, deer, rabbit, mink and pig; and are therefore plentifully distributed through the eggs which are scattered over the pastures or are washed into the waters and thence find their way into the stomach.

The lungs, the heart and the flesh are occasionally infested with the immature forms of several tape-worms, as well as with the well known spiral flesh worm, Trichina spiralis. The tape-worm larvæ appear in the so-called measle which has been found in the flesh of the calf as well as in that of the ox, and which is very similar to the pork measle. A beef measle is shown at Fig. 303 magnified to nine diameters, and the appearance of the flesh of an infested calf and of infested beef is shown at Fig. 304, A B. These parasites enter through the stomach, being taken up with the herbage in pasturing, or in the water, in the form of eggs or sections of the mature worm. The mature

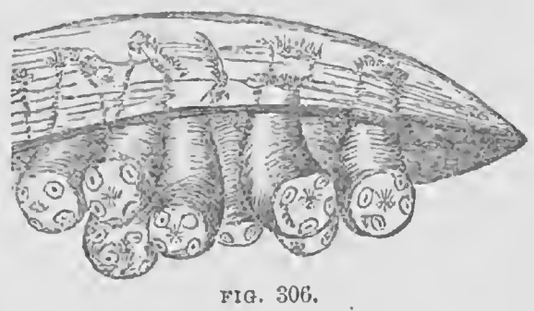

FIG. 306.

worms, of which several species are concerned, inhabit the intestines of mankind, the sheep, the dog, cat, rabbit and several other animals. Four species are known to infest cattle, the flesh measle, Fig. 303, Cysticercus bovis; the bladder worm found in the lungs, Echinococcus veterinorum; another found in the lungs Figs. 305, 307, Cysticercus tenui-collis, and one found in the brain Fig. 306, Cœnurus cerebralis, the same which causes the gid or sturdy in sheep, a disease marked by a conspicuous sympton, viz, that of a peculiar rotary motion, staggering, and a sidewise stiffening of the neck. The lung bladder worm, shown at Fig. 307, usually has the head and neck drawn within the bladder and then appears as in Fig. 305. The brain bladder worms congregate in the bladder, as shown at Fig. 306, which represents a portion of the bladder with several of the larvæ attached to the membrane, highly magnified. The fluke infests the gall bladder and ducts and the substance of the liver. A mature fluke, Distoma hepatica, is shown at Fig. 308 its natural size. This pest is very common among sheep, and is found in the deer, antelope and rabbit as well as in the ox.

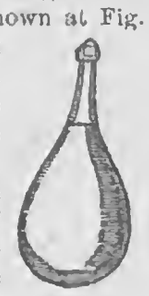

FIG. 307.

FIG. 308.

Unfortunately the remedies against these pests are ineffective; prevention alone avails anything. The top-dressing of pastures with sheep and hog manure is the chief source of the evil, which fortunately is not nearly so prevalent in our country as in Europe and more especially in India where few cattle are exempt from one or several of them. It is well to be forewarned, however, for we have these parasites in too great plenty already, and it needs only a more common manuring of pasture and a more intensive system of cattle feeding to encourage the spread of them from our flocks to our herds. The effects of these parasites are two-fold. They are injurious to, and frequently destroy, cattle in an unsuspected manner; and the bladder worms and measle infect the flesh and convey themselves to the human stomach and intestines in which they mature as tape-worms. This result, however, is avoided by the thorough cooking of the meat and abandoning the prevalent habit of eating it "rare" or half cooked. Fortunately we as a people are not given to eating raw flesh, and so long as we avoid passing these disagreeable creatures through our own systems they cannot make much trouble in our cattle. Smoked beef, sometimes eaten raw, is dangerous and should be as well and thoroughly cooked as fresh meat.

Scientific and Useful.

CORRECTION.—In Bulletin No. 60 the Nitrogen in E. Frank Coe's Superphosphate, No. 586, should be 2 34 per cent., and the valuation $35 12. Cost, $36.

In the same Bulletin, the Reverted Phosphoric Acid in Rafferty & Williams' Ammoniated Superphosphate, No. 590, should be 1.23 per cent. instead of 7 23 per cent.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN NO. 59, MAY 5, 1881.

Fertilizer Analyses.

POTASH SALTS.

571. German potash salts. Imported by Rafferty & Williams, New York, sold by F. Ellsworth, Hartford.

595. Muriate of Potash, imported and sold by Mapes F. and P. G. Co., Hartford.

	571	595.
Potash	12 51	51.21
Chlorine	27 23	
Equiv. sulphate potash	23.20	
Equiv. muriate potash		81.11
Selling price	$2 per 200 lbs.	$42 per ton.
Cost 100 lbs. potash	$8.00	$4.10

The "potash salts" contain a good deal of sulphate of magnesia and common salt and may, now and then, have a fertilizing value beyond supplying potash. This grade of potash salts wholesales now at $7.25 per ton.

BONE.

582. Bone, No. 1.

583. Bone, No. 2. Manufactured and sent by G. H. Harris & Son, Eagleville, Ct.

584. Strictly Pure Ground Bone, made by G. B. Forrester, 188 Pearl St., New York, sold by S. B. Wakeman, Saugatuck.

585. Peter Cooper's Pure Bone, sold by Simon Banks, Southport, Ct.

The last two samples were taken and sent to Station by G. P. Jennings, Greens Farms, Ct.

Mechanical Analysis.

		582	583	584	585
Fine,	smaller 1-50 in	2	3	16	51
Fine medium,	" 1-25 in	2	8	14	15
Medium,	" 1-12 in	8	17	36	13
Coarse-medium,	" 1-6 in	34	27	34	15
Coarse,	larger 1-6 in	54	45	0	6
		100	100	100	100

Chemical Analysis and Valuation.

	582	583	584	585
Nitrogen	4.05	3.66	4.18	1.40
Phosphoric acid	21.83	7.74	21.80	9.93
Cost in market, ton	28.00	28.00	34.50	35.00*
Estimated value	$28.33	$24.68	$33.04	$26.48

* In Southport on trial, $33 in New York.

Sample 583 was rather moist (12 per cent. water) which reduces its value somewhat.

585 has had a good share of the gelatine extracted, hence is poorer in nitrogen and richer in phosphoric acid than raw bone.

COTTON AND CASTOR SEED.

579. Cotton Seed Meal, made by B. G. Stanton, New London, sold by Coles & Weeks, Middletown. Sampled and sent by J. M. Hubbard.

580. Castor Pomace, sold by Wilson & Burr, Middletown. Sampled by J. M. Hubbard.

Analyses.

	579	580
Nitrogen	3.56	6.01
Phos. Acid	1.70	1.70
Potash	1.57	1.20
Selling price	$30.00	$21.00
Estimated value	$14.84	$22 35

579 is evidently cotton seed ground with the almost worthless *hulls*. Decorticated cotton seed meal contains nearly twice as much nitrogen, etc., and is worth about twice as much.

SUPERPHOSPHATES.

557. "Bone Phosphate," made and sent to Station by David Dickinson, Middle Haddam.

577. The same. Sent by H. L. Stewart, Middle Haddam.

558. "Ammoniated Bone Phosphate," made and sent to Station by David Dickinson, Middle Haddam.

576. The same. Sent by H. L. Stewart, Middle Haddam.

581. "Phosphate made and sent to Station by Geo. H. Harris & Son, Eagleville.

578. "English Phosphate," imported by H. J. Baker & Bro., New York, and sold by Wilson & Burr, Middletown, Ct. Sent to Station by J. M. Hubbard, Middletown.

Owing to present advanced prices the Station valuations are, in most cases, too low, as respects nitrogen and potash, by about the difference between the wholesale cost of raw materials and a fair retail price for manufactured fertilizers. S. W. JOHNSON, Director.

Miscellaneous.

BOOKS, CATALOGUES, ETC.,

THE TWENTY-EIGHTH AGRICULTURAL REPORT OF THE MASSACHUSETTS STATE BOARD OF AGRICULTURE makes a book of 400 pages. The Secretary briefly reviews the agricultural profit and progress of the last year, and says the farmers' institutes have increased greatly in number and value. The value of the hay and fodder interest makes ensilage a highly important issue, and the Secretary is evidently almost persuaded. He says: "The evidence of the persons using the ensilage is strongly in its favor. The success so far has met no check, and if half that is claimed for the system is realized in practice, there will be a great change in our methods of farming. It is proved that silos can be easily and cheaply constructed; that any green crop can be preserved by a simple process; that cattle readily eat it and large quantities may be fed without injurious effect; that cattle so fed require but a small quantity of water." He adds, however, that corn meal or cotton-seed meal must be fed with ensilage, and it is an important question how much value should be attributed to the former and how much to the latter. More time also is necessary to show the effect of such food on the health of cattle and the vigor of the race. The dairy product of Massachusetts is second only to hay in value and of great importance. An increase in the number of cows goes along with an improvement of the breeds. Co-operation is desirable between consumers and producers of milk at Boston and other cities to secure good milk from well-fed stock at the lowest price. The daily consumption of milk at Boston is now less than half a gill per inhabitant. No doubt that a consumption of a pint each would vastly improve the general health, as well as profit the dairy interest. In corn, the next most important interest, the report says that 40 years ago it cost $18 to cultivate an acre of corn, the equivalent in labor of $30 now, but the introduction of the horse-hoe

has reduced the cost of the labor outlay upon the corn which takes the premiums in our societies, to less than $7 50 per acre; the horse-hoe is not only more rapid, but by pruning the corn roots actually increases the yield of grain and reduces the amount of stock or stover The report laments the decline in sheep culture, but reports a great increase in poultry. Among the valuable discussions and papers of the report are one had by John Robinson of Salem on ornamental trees; on setting milk for cream by Edward Burnett of Southboro, one of the famous farmers of Deerfoot Farm; the growing of corn by Dr. E Lewis Sturtevant of South Framingham; farm architecture by E. C. Gardner of Springfield, who says a good word for the old style farm-house, because the designer knew what he wanted and stopped when he got it; silos by Prof. Goessmann and others. There are also judicious selections from the society reports.

A Practical Treatise on the cultivation and manufacture of sugar cane—soil, seed, planting and cultivation, harvesting; mills, evaporators, skimmers, furnace; making sirup, defecation and clarifying, etc. Published and furnished free by J. A. Field & Co., 1622 North Eighth St., St. Louis, Mo. Also, by the same firm a catalogue and price list of Big Giant and Improved Big Giant Feed Mills, sugar cane and fanning mills.

Dr. Ryder's American Fruit Drier or Pneumatic Evaporator by the American Fruit Drier Manufacturing Co., of Chambersburg, Pa. An illustrated pamphlet of 35 pages setting forth the progress made in evaporating fruit—correct and erroneous principles; evaporating fruit as a business, directions, statements, testimonials, etc. Sent free to our readers upon application to the above concern.

J. E. Hayner & Co's Testimonial Circular of Walter A. Wood's Twine Self-binding Harvester. Letters from those who used the machine last harvest—36 large pages. Apply to J E Hayner & Co., 945 and 947 N. Second St., St. Louis, Mo.

The Boomer & Boschert Cider and Wine Press. Syracuse N. Y. A finely illustrated catalogue of 37 pages showing the different power presses with detailed cuts and explanations. Sent without charge to applicants.

RURAL BRIEFLETS.

And now let us drop the long-accepted view that certain leguminous plants obtain their nitrogen from the atmosphere. Dr. Lawes published in the R. N-Y of Feb. 19, p. 120, the following:

"I am disposed to hold the same opinion as yourself, that the bone has little to do with the immense yields. At the same time the food must come from somewhere. All our experiments are tending more and more to draw the line between the food which plants obtain from the atmosphere and that which they obtain from the soil. When once this is done; when we cease looking up to the air for the fertility which is all the while lying under our feet, we shall then see plainly very much which is at present obscure."

In his concluding article on "Fertility" in the London Agricultural Gazette, Dr. Lawes says:

"While I do not deny that plants may take up some carbon from the soil; and that they, or the soils in which they grow, obtain some combined nitrogen from atmospheric sources, still, the results of the Rothamsted experiments, relating to the chemical statistics of agricultural production, *clearly show* that the atmosphere is the *main*, if not the *exclusive* source of the *carbon of our crops* and that the *soil* is the *main*, if not the *exclusive source of their nitrogen*." The italics are ours. . . . . .

Mr. Waldo F. Brown of Ohio, a well-known agricultural writer, made the statement a month or more ago that Blount's White Prolific and the Peabody Branching Corn were the same. We submitted the statement to Prof. Blount whose reply appeared in this journal of two weeks ago. He denies that there is any further relationship than that existing between the many varieties of Indian corn. Lately we were talking with a New York firm that first offered the Peabody for sale years ago. The firm had tried both kinds and assert very positively that Prof. B's statement is correct.....

Among new hybrid perpetual roses, we notice "Mrs. Jowitt." It is introduced by the Cranston Nursery and Seed Company of England. It is described as of a brilliant glowing crimson, shaded with lake, while the flowers are very large and globular—bold, well-built, of grand form and substance. The habit is robust—the flowers fragrant. It is said to be one of the best English roses ever raised.....

Mr. Wyson, our accomplished Virginia contributor, writes as follows in a letter to one of the editors:—

I have examined the flowers of peaches, pears, and apples. In the case of peaches, I have pretty well satisfied myself that fertilization in nearly all cases takes place before the flowers expand. With pears, I found two trees in which it occurred after the flowers expanded, and one in which it did so before. I noted that the tree which was fertilized before the flowers expanded set fully twice as much fruit as the other two. The same remark applies to apples as to pears.....

What Others Say

Onions for Chicken Cholera.—We have frequently called the attention of our readers to the fact that there was no better food or medicine for fowls than raw onions, and now a correspondent of a Canadian paper, according to the Sun, asserts that this strong-scented bulb is a sure preventive, if not a specific, for chicken cholera. He says that while his neighbors for several miles around lost nearly all of their chickens by the so-called chicken cholera, his were entirely exempt from this disease after a first attack, which was cured by feeding raw onions mixed with other food once a day for several days in succession, and afterward only once a week. A little ground ginger was also added occasionally, with plenty of green food, such as celery tops, turnips, &c. The remedy is certainly worth a trial.

Hogs versus Babies.—The Scientific American thinks it a pity that babies have not a market value, like hogs. A death-rate among the pigs less than one-third the death-rate among children in our large cities moves the government to costly investigations of the cause, and to diplomatic correspondence with foreign nations, while Produce Exchanges get excited on the subject, and all the newspapers join in the discussion. The babies die by the thousand in New York and other overcrowded cities, and scarcely any notice is taken of the fact.

Improvement in Peeling Peaches.—The work of peeling peaches in peach-drying establishments has been simplified by the following process, says the Journal of Chemistry. A crate filled with fruit is dropped into a vat containing hot lye, and there shaken. It is then removed to a tank of pure cold water, and the lye is washed away. The skins of the fruits by this process become so separated from the pulp that they are drawn off with one movement of the hand. This saves much time, labor and expense. The new process causes the fruit to dry more readily, and a very little loss in weight ensues.

Percheron-Norman Horses.—The following is from the N. Y. Sun: Mons. Lavalard, who has the general care of the stables of the Paris General Omnibus Company, tells us through Wallace's Monthly that the animals which are now and have been for some years past imported into this country as Percherons are merely overgrown beasts picked up in various parts of France, and are really not Percherons or a distinct breed at all. He calls them "Mastodons," and in this at least he is correct, for they are ungainly creatures at best. Mr. Wallace says: "There is no use in attempting to controvert the assertions of a man of Mons. Lavalard's knowledge and position;" and if this is true, the so-called Percherons so much talked of, and largely introduced into Illinois of late, are frauds, at least in the way of pure blood. It looks as though somebody had been badly sold, and there is a good chance for a little newspaper controversy over the elephantine specimens of horse-flesh imported from France during the past ten years."

[We should much like to know if M. Lavalard's statement has a foundation in truth.—Eds.]

We see an account of one tract of over 9,000 and another of 2 500 acres of flax in Iowa, says the Farmers' Review.....A Western editor, who started a newspaper, called it "The Small-Pox," so that everybody would take it when they got where it was.....The Cleveland Leader thinks that America has not enough navy to back'er.....Says the Inter-Ocean, two ten cent drinks will supply a family with flour—that is, if the drinks are not taken and the money is invested in flour.....They were looking at the new carpet, and he said, "But what are those plants in the center:" "I don't know, my dear, unless they are Brussels sprouts."".....Dio Lewis presents some strong authorities as opposed to the practice of checking horses. He says: "When you compel a horse to contract the muscles just under the top of the collar, in order to sustain the head a foot, more or less, above its natural place, and then hold them thus contracted, the strain on these muscles soon produces great harm. If you don't believe it, watch the animal; look at his eyes and ears! I am sure you cannot misunderstand that face. See him carry his head around on one side, and then away around on the other side. Now, in a moment you will see him throw his nose up in front as high as he can, three or four times. That struggle for relief he continues all day long. When you take off the check, he will hang down his head low, and show in his face a sense of relief which I am sure you cannot misunderstand. The long strain wastes the muscles and produces that ugly hollow which is now so common under the collar."..... Some of the Boston papers predict that the mails will be carried between that city and New York in pneumatic tubes within three years. O! wait until 1885 and "shoot" reports of that world's fair to us.

Everywhere.

RURAL SPECIAL REPORTS.

California.

Santa Rosa, Sonoma Co., May 30.—We have had an unusually fine Spring—nearly a month earlier than usual. No drying north winds. Haying is now well under way. The fruit crop promises to be abundant, the late frost not having done as much damage as was supposed. The season for the wild flowers is passing, and the dry ridges on the hills and mountains are changing from the red, yellow, blue, white and green with which they have so lately been clothed to the dry brown of a California Summer. L. B.

Florida.

Starke, Bradford Co., May 28.—We are having delightful weather: during the day there is a fresh, cool breeze, and the nights are so cool it brings a suspicion of frost in more northern latitudes. Orange trees are now making the second growth, and they look nearly as well as before the freeze last Winter. All vegetation is looking remarkably fine. Our corn has just been plowed for the last time. We have one acre fertilized with Stockbridge manure, which is very fine. We have some of the finest Irish potatoes I have ever seen in this country, also fertilized with Stockbridge. There is great complaint of potatoes rotting this season; ours do not at all; they are large, smooth and not worm-eaten. We now have for vegetables peas, cucumbers, spinach, tomatoes, sweet corn, cabbage, carrots and turnips. We still have plenty of strawberries from the same bed we have been picking from since the middle of February We had a bed of Charles Downing which was full of nearly ripe berries when the December freeze came; the plants were so badly hurt we feared they would all die; they are now growing fast, and are full of large, ripe berries. The bed has had nothing done to it; it has not been even watered during the dry weather. I do not understand why they bear so long here, on this light, dry soil, when on your rich, heavy soil the season is so short. I supposed at first it was because they only ripened a few at a time, but I find if we make the ground rich they fruit quite as heavily as they do North. I. S.

Kansas.

Manhattan, Riley Co., May 30.—We are just finishing the shortest, latest, wettest, hottest and generally the most favorable Spring season of the eight that I have passed in this State. It has rained, on an average, three nights every week for the past month, with two or three all-day rains thrown in for full measure. However, if we have to die this is the disease we wish to perish by. Wheat is recovering rapidly from the great injury it sustained last Winter by freezing. At the present time it looks as though the crop would be from two-thirds to three-fourths of an average, taking the whole State. A very large area of corn is being planted, much of it the second time, for the complaint of a failure of seed is very general. Listing (?) is all the rage this season and bids fair, upon our bottom lands at least, to supersede all the old methods of corn culture. By this method a man and three horses will alone tend 100 acres of corn. A. B C.

Parsons, Labette Co., May 28.—Weather showery. Weeds gaining on the corn, though both growing apace. Wheat damaged one-fourth by insects. Harvest in ten days. Away West, the wheat is most promising and there are the Kansas wheat fields. From Arkansas complaints come of grass and weeds crowding corn and cotton. Wheat at Waco in Texas is cut. Crop good but acreage a quarter short. Corn in Texas promising. J B

Salina, Saline Co., May 30.—Our wheat is now filling and is very fine in this neighborhood, although I hear there are many poor pieces of wheat in the county, in which I see by a local paper that there are 100 000 acres under the crop. A. G W.

South Haven Sumner Co., May 26.—Plowing here commenced in earnest about the 25th of February, after the coldest Winter ever known in this country: since that time but few days have been lost from the plow up to last week. Considerable corn was planted in March, and it was about all in by the 25th of April. Now about one half is plowed over the second time. We have a splendid stand all over. Some wheat was hurt by the Winter, but the present stand and prospect are sufficient to warrant 15 to 20 bushels per acre. It is all in head at this time except some late pieces. Oats afford a fine prospect at this writing. Prairie grass is tall enough to make a good swath. Peaches will be plentiful over a large portion of the county. Of apples but a few trees are in bearing; prospect good where there are any trees. Small fruit prospect good. Onions, peas, radishes, etc, have been in use for some time. Potatoes will be plenty in a week or ten days. Rural seeds all planted, all came up well. The White Elephant Potato has advanced one-third ahead of other sorts planted by its side some days before it. The Rural Branching Sorghum came up pretty well, and is doing better than I expected from what was stated regarding its slow growth in the early stage. Its growth almost equals that of other sorghums. A. G. B

Maryland.

Chesapeake City, Cecil Co., May 23.—From the White Elephant Potato the Rural sent me, I planted 16 eyes on April 20, 15 of which sent up vines which are now six inches high. I can't think they are an old variety, as some of your readers do. The vine is a very hearty-looking one and so far I am much pleased with it. G O. M.

[The columns of the R N-Y. are ever open to our friends for a free expression of their opinions. Those who have supposed the White Elephant Potato to be an old variety will soon find out their mistake.—Eds.

Missouri.

Caldwell, May 28.—Prospects for wheat fair; some chinch bugs. Potatoes fine; weather seasonable. R W. E.

Nebraska.

Brownville, Nemaha Co., June 3.—The "great flood" in the West, drowned us all out, especially along the Missouri River Valley. We Western people are wonderfully recuperative, however, and another season will leave no traces of the disaster. R. W. F.

New York.

Eddytown, Yates Co., May 23.—Spring has been backward and, until the past week, severely dry. We had a few hot days, the thermometer registering 90 degrees and over in the shade. On account of the dry weather much of the Spring seeding was delayed The few pieces that were sowed early in good condition are just "booming," and all are coming on finely. Some corn is planted, though not very much, I think. Wheat has suffered severely from the hard Winter, and more from the dry, cold Spring, except now and then a piece where all conditions were right, such as thorough cultivation, soil in high condition of fertility, and early sowing. The prospect for a crop of hay is not encouraging at present, though the late rains may change the outlook. Apples are now in full bloom, or just passing out of that condition; but this is the "off" year with most orchards in this vicinity. Peaches on Keuka Lake, the principal section for that fruit, promise well, and so do cherries and plums. Strawberries, the few that are grown, are looking fine, and are in very abundant bloom. Grapes are getting rapidly to be the staple production of the lake regions of this county, as well as of Steuben and Schuyler; they have come through the Winter in good order, and are coming forward rapidly, quite as much so as is desirable. A great addition has been made to the acreage by the planting of new vineyards this Spring. Judging by the number of vines that have been sold, probably in the neighborhood of 200 acres will be set out, and I think this estimate is quite a low one. There has been some little talk among farmers about sorghum planting, but whether it will amount to anything I cannot at present say. W H. O.

North Carolina.

Seaboard, Northampton Co., May 27;—We have had in this vicinity lately two very severe hail and wind storms, and several of our farmers have been compelled from their effects to plow up and replant their cotton crops. Except for these disasters, crops of all kinds are looking well and promising; these storms however, were confined to a small portion of the country. The fruit crop is short; almost a failure in some localities, but in others the crop of peaches, apples and berries of all kinds will be abundant. E. N P.

Texas.

Honey Grove, Fannin Co., May 30.—The wheat prospect is fair and the crop will be cut in a few days. Oats give promise of more than a usual yield. Corn is looking fine, though a little late. Cotton is doing well, but the weather is a little too wet for it just now. New peas and potatoes are in abundance. Strawberries were excellent, though those planted in hills were winter-killed. I have only two kinds, Wilson and Peabody. Grapes were lessened in quantity by frost, but they are better than usual in quality and size. I have the Concord, Clinton, Isabella and Delaware, and a fine lot of California raisin grapes not bearing this year. Large fruits were killed by the late frosts. The White Elephant sent by the Rural produced a plant from each eye. Asparagus is up and doing finely. The Rural Branching Sorghum grew well but is much injured by insects. T. B. G.

The Querist.

ANSWERS TO CORRESPONDENTS.

The Jumping Sumach Beetle, etc.

J. L. P., Worcester, Mass., sends specimens of "bugs" which are severely injuring the Smoke or Fringe Tree in his neighborhood, and asks an account of them; 2, a pastnre adjoining his own is being destroyed by what he calls "wire-worms," and he asks whether an application of salt would be likely to arrest their progress.

ANS.—1. The bugs are the Jumping Sumach Beetles (Blepharida Rhois) and not only do they attack the Fringe or Smoke Tree (Rhus Cotinus), but several of our native species of sumach. Prof. Riley, in his 6th Missouri Report, gives, in substance, the following description of their habits:—As soon as vegetation starts in the Spring the beetles, which have passed the Winter, as such, in sheltered situations, may be seen upon their food plants, sometimes in great numbers. Very soon after the appearance of the beetles, the stems and branches of the plants named, if carefully examined, will be found more or less covered with little elongated pellets of excrement, dark when fresh, but becoming paler and grayish-brown when dry. If more carefully examined, they will each be found to contain five or six pale, yellow eggs. These eggs give birth, in a very few days, to little dark-yellow worms with conspicuous black heads. This worm no sooner begins feeding than it besmears its back with its own excrement, the object of this filthy habit, no doubt, being the moistening and protection of the soft body from the sun's hot rays. When it has attained its growth it descends into the ground where in due time it changes to a pupa, the beetle emerging in a little more than two weeks, after which the second brood of worms soon make their appearance. It often happens that the first brood have not all disappeared before some of the second brood hatch. The second brood disappear about the 1st of July, and there are none to be seen during the hot Summer months. In September another brood appears, the beetles from which pass the Winter in some sheltered retreat. The beetles may be jarred from the trees on a sheet or on paper, and killed, though it is probable there will be nothing so effectual for both beetles and worms as Paris-green or London-purple, in the proportion of a tablespoonful to a bucket of water, stirred well and the tree sprinkled with the mixture. 2. We suspect the cut-worms spoken of as destroying the pasture are Army-worms. It is impossible to say positively that they are Army-worms without seeing them, but we know that they have a cut-worm habit as well as a migratory, the first being the more usual habit when they are not very numerous. They have probably gone into the ground to pupate ere this. There may be a Fall brood, though it will not probably be numerous. If they prove to be Army-worms and travel, the usual remedies can be resorted to. Salt will be of little service. If the pasture were very smooth rolling would kill many.

Treatment of Currant Bushes.

W. S. T., Upper Red Hook, N. Y., has an acre of Cherry Currants in their third year. They have been thoroughly cultivated and are making a rapid growth, and he inquires, 1, whether it is not well to keep the strong outside sprouts pinched back well to make them more stocky, after they have grown a foot or so; and, 2, whether some of the long, spindling shoots from the inside of the base should not also be pinched out to admit light and air; 3, is it well to allow a strong bush of the above age to ripen a full crop of fruit.

ANS.—1. Our own way is to cut out the old wood each Fall or Winter as occasion permits. We do not approve of pruning the currant very severely, as some direct. The object is to have a maximum of large fruit, and this is best gained by so pruning each year that the bushes maintain a symmetrical form, free of old, black wood. 2. We should not pinch back the young shoots. If too many shoots start, rub them off entirely when they first appear. So treated, we should allow the bushes, when three years old, to ripen all the fruit they will. In this connection let us remark there is nothing better for the currant than *mulching*. Mulch before the dry weather sets in with manure, grass, hay, straw, corn-stalks, or anything of the kind. But the very best mulch is cow manure. 3. Yes.

Remedy for Wire-Worms.

M. W., Cohocton, N. Y., asks how to destroy wire-worms.

ANS.—The most thorough method of ridding land of wire-worms on a large scale, where they have been destroying field crops, is to starve them by summer-fallowing the land, plowing it often enough to keep the weeds in check, as otherwise the worms could feed upon their roots. When the expense of letting the land lie idle is too great, it will be found profitable to raise a crop of buckwheat—a crop which the worms are said not to touch—but the thoroughness of this is impaired by the fact that weeds will grow among the buckwheat and furnish food for the worms. Upon a small scale—in flower beds and vegetable patches—the worms can be profitably trapped in slices of potato which may be either placed upon the surface of the ground or beneath boards. The potatoes should be examined every day and the worms destroyed.

Miscellaneous.

A. G. W., Salina, Kan., asks, 1, whether soil can be made too rich for strawberries; 2, are there two sexes among strawberry plants.

ANS.—1. Many kinds of strawberries require rich soil to do well, as for instance, the Great American, President Wilder, etc., others will thrive in a comparatively poor soil, as the Wilson. All are benefited by a rich soil, some are rendered unprolific by too much manure, the plants growing to leaves at the expense of the fruit. 2. Yes, there are two sexes in every strawberry flower. In many, however, the stamens become sterile and the pistils must receive their pollen from other plants. Thus Hovey's Seedling, the old Scotch Runner, Crescent Seedling, Golden Defiance, etc. are *pistillates*, having imperfect stamens. Such plants must be grown near other kinds having perfect flowers—like the Wilson, Charles Downing, etc. Insects or the wind carry the pollen from the one to the other.

E. J. A., Centre, N. C., asks the cause of the black heads in wheat, and the remedy for them.

ANS.—They are due to a fungus commonly known as smut, scientifically as Uredo caries, which attacks the grains of wheat and causes an abnormal enlargement and forms a black fungoid mass. To prevent this growth the seed wheat should be steeped in a strong brine or in a solution of sulphate of copper. This may be done as follows:—Dissolve a pound of the sulphate in a couple of gallons of hot water, pour the solution into a tub and add three or four gallons more of water. Then place a basket in the liquid and turn the wheat slowly into it. Let it soak 20 minutes, then take out and spread the seeds on the floor. Sift plaster on the seed to dry it, and sow at once.

C. L. H., Mendon, Mich., asks how to get rid of moles which are very troublesome.

ANS.—In our own experience we have found that while moles are abundant one season, they often disappear the next. We have been exceedingly annoyed with them at the Rural Grounds and have tried at various times every means of killing or driving them away, that we could hear of. The result has been that we take them as they come. Moles prefer animal food such as worms and insects. We have confined them in pens and have found that they refused corn, potatoes and the like until driven to eat them by hunger. It is therefore impracticable to poison them. Coal or gas tar placed in their runs will drive them off for the time. There are several kinds of traps now made which will catch and kill them. But where they abound, these traps will be found a very slow and unsatisfactory method of exterminating the moles.

G. B. M., Charlemont, Va., asks, 1, what soil is best suited to the tea-plant; 2, how is it cultivated; 3, will it live out-of-doors through the Winter.

ANS.—1, Almost any good arable soil, free from stagnant moisture, is well adapted to this plant. Frequent rain-falls are advantageous. It is said that the tea plant will flourish wherever the currant and blackberry will. 2. The seeds are gathered in November, but are not properly ripe until the next Autumn. They are then kept in sand until the following Spring when they are sown, commonly in seed beds, but sometimes in rows where the plants are to grow. In the former case the seedlings are planted out, when a year old, in rows from three to five feet apart. When the plants are about 18 inches high, they should be pinched back. They yield a little the third year. 3, The varieties thus far tried have not proven hardy in Washington.

S. M., Nunda, N. Y., asks what is a good proportion for the ingredients in a wash of aloes, carbolic acid, etc., to prevent the depredations of the borer in the orchard, and how should the wash be applied.

ANS.—To a gallon of water, add a teaspoonful of aloes (powdered), a tablespoonful of flour of sulphur. We usually cut up half a cake (¼ lb.) of carbolic soap. But it may be just as good without it. Add tobacco water, a little salt, or even hellebore (tablespoonful); or Paris-green (teaspoonful) may be used. The object is to make the wash offensive to the insect. A quantity of lime sufficient to make the liquid of the consistency of thin whitewash should be added. We wash our trees in May and June and again in the Fall.

C. S., Dayton, Wash. Ter., sends some specimens of insects that are injuring his apple orchard, and asks their name and character. To get rid of them he has stripped the trees of their leaves.

ANS.—After your pains we are sorry we cannot serve you. The box was received in order, but its contents were one black, decayed mass in which we could not distinguish any insects. We should presume that the insect is likely to be the louse or aphis which of late years is taking possession of all sorts of fruit trees. A syringing with Paris-green water or with whale-oil or tobacco water would in that case have been preferable to stripping the leaves, which must, of course, impair the health of the tree.

B. T., Stevensville, Mont. Ter., asks, 1, where can cranberry cuttings be obtained; 2, the name of a good work on cranberry culture.

ANS.—1. Joseph J. White, Juliustown, Burlington Co., N. J., can supply cranberry vines. They may be planted up to June. There are three different varieties, the Bell, the Bugle and the Cherry Cranberries, each distinguished by its shape, from which the name is derived. They differ only in shape, and are about equal in quality. They have all been brought into cultivation from wild beds. Perhaps the Cherry—a round fruit—is most commonly grown. 2. White's Cranberry Culture is the only book published on the subject. It is a good and practical work.

J. A. W., Sulphur Springs., Tex, asks which is the best sulky cultivator.

ANS.—There are a great many excellent cultivators and what one man would call the best, another wouldn't. In most of them the points of difference are very small. We can recommend the Buckeye made by P. P. Mast & Co., Springfield, Ohio; and the Thompson, made by Edmiston & Waddell, 281 Greenwich St., this city. The Buckeye is made in several different styles to suit different parts of the country. It has wooden standards while those of the Thomson are iron; there is also some difference in the style of shovels. Both parties will send descriptive circulars on application.

A. J. C., Salt Lake City, Utah, desires to know, 1, how old Sugar Maples must be before yielding sap for sirup or sugar; 2, where he could get huckleberry bushes to plant; 3, would the RURAL recommend fastigiate maples for wind-breaks.

ANS.—We have seen trees of a foot or less in diameter that yielded a fair flow of sap. The age we cannot state. 2, We know of no better way than to apply to nurserymen. They do usually offer them for sale, but might procure them for you. 3, Almost any of the maples would be useful for this purpose. Most of them assume a roundish, fastigiate shape. The Silver Maple is the most rapid grower.

G. W. S., Patchogue L. I., asks whether the Angers Quince is worth cultivating for its fruit; he also sends some corn with a request that we would plant it and fertilize it with Chester Co., Mammoth and send him some kernels of the cross.

ANS.—The Angers is used chiefly as a stock to dwarf the pear. It is rather late. The fruit is quite like that of the apple quince, but harder. We thank you for the corn and would gladly comply with your request except we fear it might mix with other varieties with which we are experimenting.

F. H., Tilton, N. H., sends for name an apple which, as we did not recognize it, we sent to Mr. Charles Downing, who replies:

"I do not recognize it as any variety that I am acquainted with, that is, if it is a representative specimen. It appears like a long keeper, but the quality is not more than second-rate, yet being late and handsome it might be valuable for market."

L. J. B., Highland Station, Mich., asks whether London-purple will kill potato vines if used too liberally.

ANS.—Yes.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JUNE 11.

NOVELLO!

DITSON & CO. are the sole agents for the United States for the magnificent Novello List of Oratorios, Operas, Glees, Part-Songs, &c. The separate Anthems, Choruses, or Glees, cost but 6cts. to 10cts. each, and are very largely used for occasional singing. The following are excellent and practical instructive works, and are called "Primers," but are really a great deal more:

1.	**Rudiments of Music.** By Cummings.	$ .50
2.	**Art of Piano Playing.** By Pauer.	1.00
3.	**The Organ.** By Stainer.	1.00
4.	**Singing.** By Randegger.	2.00
5.	**Musical Forms.** By Pauer.	1.00
6.	**Harmony.** By Stainer.	1.00
7.	**Instrumentation.** By Prout.	1.00
8.	**Violin.** By Tours.	1.00
9.	**Musical Terms.** By Stainer.	.50
10.	**Composition.** By Stainer.	1.00

LIGHT AND LIFE.

A new Sunday School Song Book. By R. M. McINTOSH. Price 35 cents. Liberal reduction for quantities.

"Light and life to all he brings,
Risen with healing on his wings.
Hail, thou heaven born Prince of Peace!
Hail, thou Son of Righteousness!"

From the attractive title to the last page, outside and inside, the whole book is full of Life, and Full of Light. Send stamps for specimen copy. Specimen pages free.

OLIVER DITSON & CO., Boston.

C. H. DITSON & CO., 843 Broadway, New York. J. E. DITSON & CO., 1228 Chestnut St., Phila.

The Literary Revolution.

To keep in good humor the good people who delight in good books; to wake up the slow booksellers who are inclined to go to sleep in the summer, instead of, like a 'possum, in the winter; and to prevent our friends, the book publishers, from forgetting us, we have concluded to publish a few more cheap books. If we are to name him at all, we must, of course, head the list with the immortal Shakespeare, and will give you either his "Merchant of Venice" or "Hamlet," or any one of his fourteen other principal plays, in beautiful type, for 5 cents. At the same price you may have Macaulay's "Life of Frederick the Great," former price $1.25, or Carlyle's "Robert Burns," or Lamartine's "Life of Mary Queen of Scots," or Thomas Hughes's "Manliness of Christ." Washington Irving's wonderful, delightful, heretofore inaccessible "Sketch Book," which contains the incomparable Rip Van Winkle, you can have for a dime. For the same price we will give you "Tom Brown at Rugby," the best boy's book ever written, except "Robinson Crusoe," which you can have also for 10 cents. To charm those who delight in fiction, we give also for 10 cents each, Cooper's "Last of the Mohicans," one of the most justly celebrated American novels, and Charles Kingsley's "Hypatia," which worthily ranks at the very front of famous historical fiction. These are only specimens of the cheap books we publish, are all in good type, neatly printed, and are not in the broad side or any other "side" or "square" style, but handy pocket volumes, of course in paper binding. Our motto, however, has always been that a book worth reading is worth preserving, as well as worth owning, and our large list of standard books, to which we are making additions, with speed unprecedented in the history of publishing, are all elegantly and strongly bound, in cloth or better style, and sold at prices proportionately low with those in paper covers. We issue these few only in pamphlet form, as specimens of the quality of our good literature, and these special terms will not be long continued throughout the United States and Canada are prepared to either abundantly supply or liberally slander our publications. We give liberal terms to clubs where no bookseller acts as agent. Descriptive Catalogue, and illustrated pamphlet describing book-making and type-setting by steam, will be sent free, on request. AMERICAN BOOK EXCHANGE, 704 Broadway, New York.

Cheap Books. Shakespeare. Three Cents. Washington Irving. A Dime. Tom Brown at Rugby. Crusoe. Cooper's Mohicans. 5,000 Booksellers

JOHN B. ALDEN, Manager.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, JUNE 18 1881.

OF all the raspberries at the Rural Grounds, Caroline, strange to say, bids fair to yield the most fruit. We are glad indeed to have commended this variety so warmly to our readers. It will be remembered that this is a yellow berry of excellent quality.

WE are this season experimenting with a number of grasses new to the Rural farm. Among them are Meadow Fescue (Festuca pratensis); Orchard Grass (Dactylis glomerata); Alfalfa (Medicago sativa); Italian Rye Grass (Lolium Italicum); Tall Oat Grass (Arrhenatherum avenaceum). Most of them are sown with oats.

WE have three specimens of the Dwarf Catalpa. All were killed nearly to the ground by the past Winter. Near one of these grows the golden Catalpa, a variety of the Common Catalpa, C. bignonioides. This was not injured in the least; while not far off the species was cut back several feet. Near this last is a specimen of the Catalpa speciosa; which, like the Golden Catalpa, was not harmed in the least.

A BEAUTIFUL shrub—quite neglected in our special shrub and tree number—is the Lilac Josikœa. The leaves do not resemble the common lilac at all, being longer, more pointed, less heart-shaped and glossy. They quite resemble the leaves of the Fringe Tree—Chionanthus Virginica. It bears its flowers not until the other lilacs have passed away—being now, as we write (June 10), in full bloom. The shrub is quite shapely in growth and extremely hardy.

WE present a fine portrait of Geo. B. Loring and a sketch of his life by Levi Stockbridge, president of Massachusetts Agricultural College. The RURAL has no personal acquaintance with Dr. Loring and can therefore have as little to say in his praise as against him. We do but express the fervent hope that he will not disappoint the just demands of our farmers and that he will fully appreciate the great good which a faithful administration of his office may confer upon the first interest of our country.

DR. LAWES tells us in another column that his experiments at Rothamsted (England) lead him to the conclusion that the influence of one dressing of dung may not be entirely at an end for 20 or 30 years or perhaps even a longer period. Again he says: "On the whole, as regards the question of economy, I am therefore inclined to advise that the dung should be carted from the yards to the field, and there be left in a heap until required for application; or that it should be applied direct from the yards. All labor expended upon dung adds certainly to the cost, but does not add with the same certainty to its value."

THE only use that has heretofore been made of the hulls of cotton seed, as they come from the oil presses, is as fertilizers. Experiment, however, shows that they may be substituted for cotton waste in packing journal boxes, especially of railroad cars, with great advantage, not only making a great saving to the company in the cost of the material, but also it is claimed, in the oil necessary, as well as rendering the heating of boxes impossible. We understand the officers of many of the principal roads in the country are giving the hulls experimental trials with a view, if satisfactory, to their general adoption.

THE NATIONAL DEBT.—The financial affairs of our Government are in good condition, and no particular noise is made about it either. Last month the national debt was reduced $11,150,721 and a further reduction this month of $10,750,000—which will probably be made—will make the total decrease for the fiscal year ending June 30th a round hundred million. It is a satisfaction to know that, amid all the hurly-burly of politics, there is a wholesome work going on in the financial department of the the Government, and the splendid record which the United States is making in reducing the public debt so largely is something of which we may well be proud. Add to this the fact that in three months over $745,000 have been saved to the Government by discontinuing unnecessary mail routes, and we get some idea of what may be done by thorough-going officials. If we mistake not, there is still much to do in this work of reform, if we can judge from what has already happened.

THE INSECT PLAGUE.—Insects are on the march again sweeping all before them. This year the locust reappeared, and from the South comes the cry; "The woods are full of 'em." In North Carolina, Alabama and Georgia they come in clouds and swarms, making so loud a noise as to drown an ordinary conversational tone. In Central Illinois the Chinch bug and Hessian fly are doing much damage to Winter wheat, and the farmers are plowing thousands of acres of it under, and planting with corn. The market gardens of New Jersey and various parts of N. Y. State are suffering from the ravages of the Army-worm. Indeed in the vicinity of Watertown several fields of grain have been destroyed and hundreds of acres of pasture have been stripped of everything green. The Colorado beetle also is doing even more than usual damage in many sections of the country. We hope to have no discouraging reports from the Northwest at any rate. They have had their share of trouble from snow and floods.

THE OUTLOOK FOR HONEY.—The past Winter has been an exceedingly severe one on bees, large losses having been suffered in nearly every part of the country. Nothwithstanding this fact, the outlook for a good honey-crop, as far as can now be ascertained, is quite favorable. Colonies have built up rapidly since warm weather came on, and those apiarists who have been fortunate enough to carry their colonies through with little loss, may look for good yields and remunerative prices. In the Northern, Central and Northwestern States a heavy Summer harvest may be expected if nothing unfavorable arises later, but in California the prospect is not as good, some of the best honey-yielding blossoms being a failure in many localities. In Los Angeles County it is thought that little or no surplus honey will be produced. Foreign reports say that Europe will produce scarcely honey enough this year for local consumption, so we may find a market for much of our surplus over there.

ABSTEMIOUS CATTLE.--One of the American officers in the Egyptian Service, Major Prout, reports that the nomadic Bedouin tribe known as Bagarra, who roam over an arid district in Kordofan, have large herds of cattle which have developed a remarkable capacity to live with little water. It is said that they require drink only every second or third day. As Major Prout puts it, the grazing area around each drinking place is consequently limited by the distance which cattle, grazing, can go in a day and a half. This power of withstanding thirst is a fact of no small interest from the physiological point of view, and it may possibly come to have in the future a practical bearing upon the question of the utilization of some parts of our "Great American Desert." The Bagarra cattle are of the humped variety and are reported to be both docile and beautiful, though, naturally enough, the cows give but little milk. The bulls are commonly trained as saddle or pack animals.

BEST SEASON OF THE YEAR FOR COWS TO CALVE.

WITH cows for the ordinary purposes of the farmer, March into May, according to the climate, is the best season to calve. For the dairyman who wishes to make Winter butter, September and October are the proper months. With the high-priced improved breeds, there is a difference of opinion as to the best time for them to drop their calves. Some prefer Spring, as the young then have six months before them of warm weather in which they grow more rapidly than in cold; and as the Winter approaches they get sufficient size and strength to enable them to go through its rigors without check, and come out lusty yearlings. Others, however, prefer Autumn, as they contend the calf gets a finer, thicker coat of hair, and turns out a hardier animal, for having its first few months of growth in cold weather. These maintain that if they provide warm shelter and good, dry bedding for the calf, and feed it properly, the Winter will not check its growth, and at three years old it will get as large a size as if dropped in the Spring. But then, we may ask, with all this warm cosseting, how can it acquire extra hardiness more in Winter than in Summer?

Another argument in favor of Winter rearing, is that the calves are not tormented with flies as in the Summer, which pests often check their growth. To this we answer, that during the day in those months when insects are most annoying, we shut up our calves in roomy, well aired, darkened stables, where flies do not enter, and let them out into a grass pasture for feeding and exercise during the night. In this way we keep them from being tormented and insure a rapid, steady growth.

PRICES OF IMPROVED CATTLE.

IF rather an extraordinary price is paid at any time for a superior bull or cow, a great hue and cry is set up against it on the part of many, and a person thus investing his money is stigmatized as foolishly extravagant, although in so doing, he may not only benefit himself, but, what is much more important, greatly enrich his country by the subsequent highly valuable produce of these animals being disseminated over it. At the same time these people who so sharply criticise such investments, turn round and pay perhaps much more extravagant prices for jewelry, pictures, statuary, bric-a-brac, luxurious furniture, and many other things which are of no real utility, and which, instead of adding to the wealth of the country, tend rather to impoverish it.

For a century past or more, the most intelligent and enterprising breeders of domestic animals in Great Britain, have been in the habit of paying five to ten times as much for superior stock as the breeder of other European countries. Now see the wealth derived from so doing. The whole intelligent stock-breeding world is their customer. Consider the United States, and what high prices our intelligent breeders have paid abroad in the first instance for superior animals, and the large profits they are now deriving from the rearing of their produce.

We began upwards of a century ago with the importation of blood horses; next came Merino sheep; then followed Short-horn and other choice breeds of cattle, together with mutton sheep and improved swine. Now look at our enormous exports of fine carriage and roadster horses; improved cattle, sheep and swine, together with their fresh and salted meats. Had we not first imported the originals of these, although obliged in many instances to pay exorbitant prices for them, and since bred and reared with intelligence and care, we could at this moment be exporting scarcely a dollar's worth, instead of the many million dollars' worth we now send abroad; nor could we be able to feed and clothe our people as comfortably and well as it is done at the present time.

BREVITIES.

ATTENTION is called to the communication of C. E. Thorne of the Ohio State University, as possibly of great importance to our farmers in the near future.

THE veteran editor, Mr. A. B. Allen, says, "The Cattle Number is superb, and makes the RURAL worthy of distinguished and honorable mention the country over."

THE Russian White Oats so extensively advertised the past season are behind any of the other ten kinds growing at the Rural Farm. They may, however, yield better.

OUR specimen of the new Magnolia hypoleuca five feet high was killed back three feet. Soulange's Magnolia, growing within 30 feet, was not harmed in the wood, though all of the flower buds were killed.

IN the ground plan of the Friesian farm house and cow stable in last issue, the following explanation should have been inserted:—A. A, cow stables; B, B, B, B, B, living-rooms; C, wagon house; D, horse stable; E, brick sidewalk.

THE Black Polled Angus is not the only polled breed that "nicks" well with the Short-horn; at the last fat-stock show in London the Prince of Wales took the cup for cross-bred steers with the produce of a Short-horn bull and a Red Polled Norfolk cow.

ATTENTION is called to the fact, as stated in the Notes from the Rural Grounds, that of all the kinds of grapes growing there, Victoria, a Concord seedling of the late Mr. T. B. Miner, was the only kind not harmed by the past trying Winter.

THE Rural Farm is looking for an almost complete failure in its Indian corn crop this season Incessant rains or cloudy skies and cool weather prevent any growth. The plants are small, tender and yellow. Many are dying from rot—or what florists might call "damping off."

MANDRAKE is recommended by the Mark Lane Express of London, for the destruction of the liver fluke in sheep. This Mandrake is botanically Podophyllum peltatum found almost everywhere in rich woods. It is sold by all druggists and from ten to twenty grains, mixed with meal, are recommended for a dose.

THAT adversity has its uses for nations as well as individuals is shown by statistics referring to the expenditure for intoxicating drinks in Great Britain. During the year 1880, the expenditure was 122,270 272 pounds sterling, which is less by 5,864,555 pounds than in the previous year, when the country was more prosperous, and the history of Great Britain in this respect, has for many years shown that the amount expended for intoxicating drinks has invariably been in proportion to the national prosperity. It is a fine method of displaying gratitude.

SALT FOR CATTLE is absolutely necessary for their health, and if they do not get it pretty regularly they are liable to disease. The very best kind of salt for cattle is the Liverpool rock. It comes in large lumps and can be broken up to any convenient size for use. When in stable always keep a lump of this in the feed box for each animal to lick at pleasure, and when the cattle are turned out to pasture put a large block of salt into an open box for their use. Rain does not dissolve it. If fine, common salt is put into a trough for them, rain dissolves it and the cattle are apt to take too much at a time; but of the rock salt they lick just as much as is necessary for them and as required for their health.

WE have now, for the purpose of testing it, 600 feet of barbed wire fence—three wires—making 1,800 feet of wire. The posts are set 11 feet apart. The cost for wire and labor was $14.00. The fence runs along a little creek in which the cows love to stand in hot weather. On the other side of the fence is a wheat field. The first day after completion, a young Jersey cow made her way between the wires into the wheat field, causing several wounds upon her back, which, though they bled freely, did not prove very serious. We do not presume that she will do so any more; but it is to be hoped that farm animals in general may learn the efficacy of barb-wire with less liability to serious accidents. That the cow escaped with injuries so slight is a mystery to us. Her hair was found on five different barb-points.

WHAT the "Derby" race is in England the "Grand Prix" is in France. Each is the great race of the year in its own country. To win the "Derby" is the highest ambition of every British lover of horse-flesh, commoner, lord or prince, and next to winning the "Derby," to win the "Grand Prix" is the highest ambition of every French horse lover. Within a fortnight the honor of winning both these races has fallen to Americans, Mr. Lorillard's Iroquois having, the other day, borne off the "blue ribbon" of the English turf, and Mr. Keene's Foxhall having yesterday carried off the "blue ribbon" of the French turf. Already America had beaten "creation" in breeding choice cattle, and now it seems it has done the same in breeding the highest equine type—the thoroughbred. As a nation of producers seeking markets everywhere, whatever serves to advertise American enterprise and skill is of advantage to us, and these two victories, following each other closely, cannot fail to force the admiration of foreigners for the products and producers of this country.

A FINANCIAL and agricultural society has just been formed in Paris with the professed object of seeking in this country compensation for the losses French agriculture has suffered by competition with our breadstuffs and meat. The prospectus of the company tells some wonderful "yarns" as an inducement to the gullible to take shares—yarns almost as marvelous as those in some of the prospectuses of mines in the Far West. The company has purchased 100,000 acres of land in Texas for the modest price of $25 an acre, from which it expects a yearly return of $40 per acre. It seems that there are two seasons in the Lone Star State. "From November to May is the season for wheat, and from May to November is the season for corn. The country is of surprising fecundity and is traversed by the great railroad of San Francisco." Texas is yet in its infancy, the projectors say, but this is just the "psychological hour" for investing money profitably there; first, because the profit on wheat is to amount to $21 per acre while the corn fields are to return $20.75 per acre!!! The French consuls in Texas or the French Minister at Washington should investigate this agricultural El Dorado, which, the prospectus says, is situated in "Parker and Palo Pinto" counties. The map places these counties away in northwestern Texas, a region that is subject to "vexation" from Indian incursions. Unimproved land in these two counties should be worth from 25c. to $2 50 an acre.

IN no place on the globe is such nicely discriminating attention given to the quality of meats as in the London market. Accordingly the prices paid there for the beef of different breeds of cattle form a fair criterion of its excellence. The cattle brought to the Smithfield market are of two kinds, according to the season—grass and stall-fed. In the first class are included a small supply of West Highlanders, slow to mature, but affording such choice joints that they generally make prices above the ordinary top figures. These have never been introduced into this country, but in view of their extreme hardiness and the gamey excellence of their flesh, they ought to "pay" in bleak mountainous sections where they would have to work hard for a living, as they do in their native home. Next comes the Hereford bullock, which comes to market only as grass beef in late Summer and Autumn. The superior quality of grass-fed Hereford beef, and the top prices for it in the London market are doubtless not the least among reasons for the growing popularity of this breed on the Western plains, where grass is the only, or almost the only, feed and, whence a great deal of the best beef goes to the English market. Devons, Short-horns off grass, Welsh cattle and those from the Netherlands and the Spanish Peninsula follow in order. From Christmas to June the supply is of stall-fed beasts, and of these the first cross between the Polled Angus and the Short-horn—long a favorite sort in the Smithfield market—brings the highest price, followed by the Polled Scot, the Devon, Short-horn and imported stall-fed cattle.

For Women.

CONDUCTED BY MISS RAY CLARK.

A DIME'S WORTH OF SPRING POETRY.

In the Spring the merry house-wife ties a rug around her head,
In the Spring she breaks the furniture and dislocates the bed;
In the Spring she has the carpet beaten till the welkin rings,
In the Spring she swaps her husband's clothes for china dogs and things.

In the Spring what's called "house-cleaning" occupies the female mind,
In the Spring your wife some "bargains" gayly starts her out to find,
In the Spring she pays two dollars for a tub that has no hoops,
In the Spring she buys flat-irons, and arranges them in groups.

In the Spring the prudent husband buys himself a book of prayer,
In the Spring he soon discovers that he's better off elsewhere,
In the Spring he lets the women turn things over till they're tired,
In the Spring he finds it healthy to be more or less retired.

DECRIPTION OF CUT.

EMBROIDERED DRAPE FOR BRACKET.

FIG. 312.—The drape is of maroon velvet; the centre flower is of pale blue velvet, with calyx of moss-green velvet appliqued to the foundation with gold-colored silk. For the stalks and leaves, which branch out to the sides, and which are worked in chain-stitch, shades of bronze-green silk are used. The flower in herringbone is worked with rose-colored silk; the other flowers are worked with blue silk in long stitch. The knot-stitches are worked with gold-colored silk It should be lined with maroon silk, and be finished with gold and maroon fringe.

THIMBLE-CASE AND EMERY-CUSHION.

FIG. 314.—A small pill-box is used for the foundation of the case; it is padded inside and covered

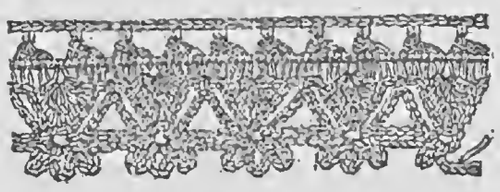

FIG. 310.

with velvet, leaving just sufficient space in the center to admit the thimble; the bottom of the box must be sewn to a larger circle of cardboard covered with velvet; a round cushion filled with emery powder and covered with velvet is placed on the top of the lid, the sides of which are ornamented with a band of embroidered perforated card.

FIG. 311.—EDGING, CROCHET AND POINT BRAID.

1st Row of heading: Fold the braid as shown in the design, work six singles into the folded part, six chain, fold the braid again, and repeat.

2nd Row: One treble into a stitch of last row two chain, pass over two stitches, and repeat.

1st Row of edge: One single into the corner of a fold of braid, six chain, one single into the next corner, ten chain. Repeat from the beginning of the row.

2nd Row: One treble into the second of ten chain, one chain, pass over one stitch, one treble into the next, one chain, pass over one stitch, one treble into the next, three chain, one treble into the same stitch, one chain, pass over one stitch, one treble into the next, one chain, pass over one stitch, one treble into the next, pass over two stitches, one double into each of five next successive stitches. Repeat from the beginning of the row.

3rd Row: One double into one chain of last row, three chain, pass over one stitch, repeat as for 3d row, five times more, one double into each of five next successive stitches, three again. Repeat.

FIG. 313—STRAWBERRY PANEL.

This design for decorative work can be utilized to advantage at this particular time when the natural subjects for reproduction are to be obtained.

FIG. 315—Design for border embroidery.
FIG. 310—Design for crochet trimming.

A GERMAN MAY-DAY.

BERTHA A. WINKLER.

QUITE a merry bustle prevailed in the village on the eve before the first of May.

The young folks especially seemed in their most frolicsome mood. Those black, and blue, and

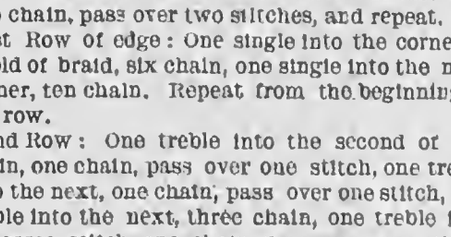

FIG. 311.

brown eyes, how merrily they danced in the little heads, and how those little bare brown feet skipped over the dusty road in restless, joyous anticipation of the next day's festival, though they were still put to work in the twilight, sweeping the road in front of their respective houses; others pounding sand between two great stones for strewing the floor, and still others busy in cleaning an array of boots and shoes. Within, the busy housewives were taking the last cake out of the oven, or looking over the garments and linen of their household for missing buttons. The men-folks were in the stable currying the cows and oxen and cutting an extra supply of fodder, all in preparation for "May Day."

With the first gray streaks of dawn the young folks started in bands to the forest for the wild flowers which grow in luxurious profusion on its borders. Their gay voices and laughter, echoing through the forest, awoke the feathered songsters far and near. Then there was music—gay, thrilling, joyous carols from lark and finch, with the deep notes of the cuckoo, and the cooing of the wild dove in the background, filling the air and welcoming the brightening dawn like the mingling of praise and prayer; as though 'twas an invisible communion of the Creator with creation, so thrillingly joyous and withal so solemnly grand was this sudden awakening of life in the forest.

The young villagers did not seem so much impressed by it, for they continued their chattering with each other as they crouched among the bushes for flowers. But then, it was nothing new to them, being treated to this early Spring chorus every morning on their way to the fields Well supplied with bouquets and wreaths, they at length started for the nearest town, about six miles distant, to celebrate the festival with all the neighboring villagers, who there congregated.

The grounds on which this festival is held here is a sort of park, several squares long and only one square wide, bounded on both sides by deep, rushing streams. The park is named "Malla," from the romantic legend of a beautiful *fraulein* of that name, who is said to have leaped into the stream from the spot on which her lover expired in a duel he fought for her sake. And, indeed, when one sits there under those shady chestnuts and broad-leaved poplars, listening to the soft rustling of the young foliage overhead, the murmurs of the stream, the distant hum of water wheels, then sees the numerous rustic bridges which span the stream, with here and there a solitary figure gracefully balancing primitive stone jugs on their heads, one feels at once transported to the Middle Ages, when lovely maidens and noble cavaliers were promenading in the moonlight on these banks—when the clink of the cavalier's sword was heard in the early morning wiping out insults and defending honor—in blood.

From these dreams of a chivalric warring past, one awakens to find the reality of the present no less interesting. Early in the morning the city regiments come here to drill and parade; the school-children, in a body, headed by their teacher occasionally promenade on the broad avenue in the afternoon; and in the evening everybody comes to witness the gymnastic exercises of the *Turners*, whose wonderful feats of bodily strength and agility create intense excitement and admiration.

Now, in close proximity to this scaffolding of the *Turners*, were erected the swings, May-poles, flying coaches and booths for the festival. The small bridges bent and creaked discontentedly under the weight of humanity that tramped over them filled with exuberant joy. Strains of music from the dancing grounds announced the

FIG. 312.

opening of the festivities and the gay, motley crowd began to separate into family groups and lover's corners. The old folks drank beer and discussed business prospects; juniors made their way to the girls and dancing-floors. Boys climbed their May-poles to be laughed at or applauded as they fail or succeed in securing the huge golden-colored cake which is fastened in the top for the best climber who then presents it to some favorite girl. The young girls enjoyed the swinging; little ones were lifted in flying-coaches by fond mothers; while the organ-grinder's free concert and the juggler's open exhibition attracted the strolling multitudes.

Towards noon the booth-restaurants were crowded with hungry, noisy customers. Sausages, cheese, bretzels, beer, wine, cider, everything palatable was called for and the *kellner* was flying to and fro most frantically. The quiet hard-working peasants had suddenly changed into jolly jokers, whose foaming glasses clinked together with a hearty "*prosit nachbar*," and sentimental lovers who quoted Schiller and ate cheese; while the boisterous little world was crowding as much pleasure as possible into the only too short day.

When the merry multitudes had departed for their homes and the bright moonlight threw the shadows of some remaining couples upon the rippling waters, we again contrasted the past with the present. Then, the splendid equipages, the dashing horsemen, the glittering swords, and the waving plumes. Now, the simple peasant, the plain artisan, the loud colors and the boisterous mirth. But, though we sigh for the splendor, the romance, and the chivalries of the past, we rejoice in the sunken power of Feudalism, the broken fetters of vassalage and the progress of a humane civilitzaion which has opened these pleasure-gardens of the mighty few to the humble many. The actors have changed, but the stage, the scenery and the grand old drama "Love," still retain their wonted charm. Still the old sweet word is whis-

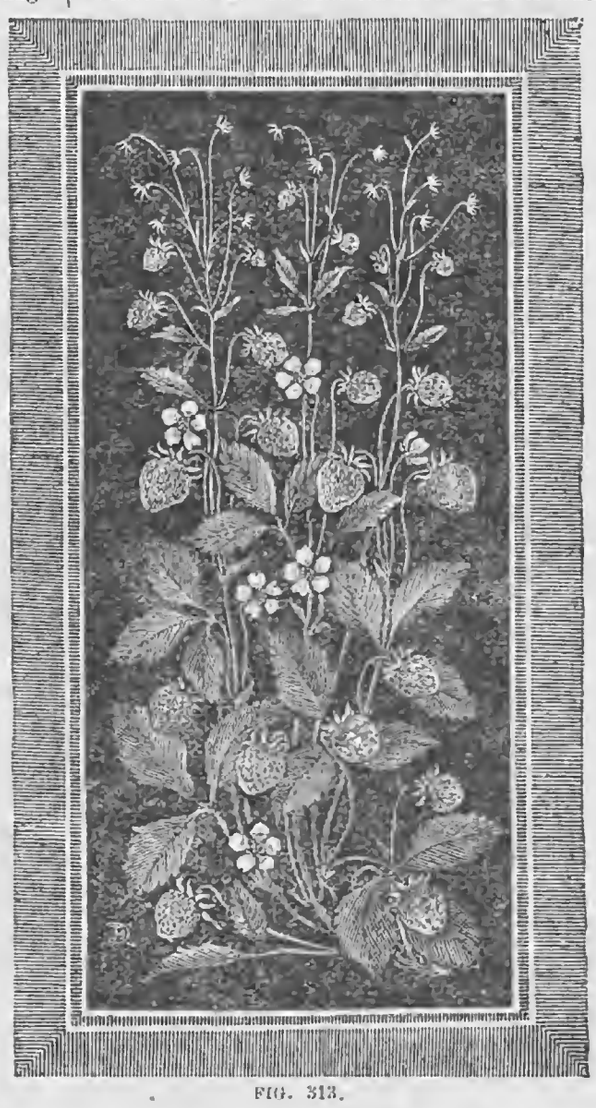

FIG. 313.

pered on May Day eve beside its rippling stream.

"Shine out, stars! let night assemble
Round us every festal ray;
Lights that move not; lights that tremble
To adorn this eve of May."

PLEASANT HOMES.

A LITTLE time and labor, at this time of the year will make the grounds about the house look tidy, neat and inviting. There is no use in having the yards all covered with sticks, chips and last year's burdock stocks, to stick their hateful burs into clothes and stockings. A garden rake, and a wheelbarrow; with a pair of strong hands, will clean up all the refuse stuff, and if there are dry leaves drifting around so much the better, it will all make a good absorbent for the manure shed or piggery. No matter if the house is old, or brown, or moss grown with age, if it is cleaned up neatly, it will look as if it were comfortable and give a favorable impression of the inhabitants, and a few flower roots set out and trimmed up nicely, will make the homliest place look pleasant. A few vines, running up the sides of the house so as to shade the windows and doors are as much of an ornament to an old house, as they are to a fine mansion. A pretty porch can be made over the door, by setting long poles each side of the steps and passing strings over the top backwards and forwards. If hop vines can be obtained set out some roots close by the poles and train the vines up the poles and string across the top. If you cannot get hop vines, plant beans, morning glories, or sweet peas; and train them to run up, and you will have something that will give pleasure all the long Summer days. Boys will enjoy helping, if you only show them how to do it, and it will be a life-long pleasure to them to know how to make things look pretty.

Do not think it will take too much time for what is time for, only to make one happy and good. Children can be taught early in life to make themselves useful, and there is no child but that likes to see a pleasant home, and if they know how to do it, will take hold and help make it pleasant.

We all of us form an idea of a person's character, when we pass his dwelling. If we see the yards all in a litter and pigs, calves and chickens, hopping over logs and chips; we are immediately impressed with the belief, that shiftless people live there. A row of sunflowers, or a clump of hollyhocks are an improvement to any place; and look far better, than rank pig weeds, or mayweed, growing everywhere. There is no excuse for the surroundings of a farm house to be filthy and cluttered up, with every thing; only just sheer laziness, and *don't-careitiveness*. I guess that is a new word, but it is as expressive a one as I know. If I cannot find one to make my ideas plain I make one that will fit the case and express my thoughts. GRANDMOTHER.

FASHIONS.

IT will perhaps be useful at this time of the year to give a few hints upon the various details of Summer fashions. To wear in fine weather, even out of doors, fashion favors semi-high shoes, laced or buttoned over the instep. To be in good taste, however, such shoes should not exhibit the various fancies which are adopted for those meant to wear at home; they should be of plain kid, at most stitched with white silk. It is the same with hose. There are colors which one should never wear to walk on foot in the streets. Need we say that among these are red, pink, or ciel-blue stockings? We think not. We will add only, that iron-gray stockings, or those of any shade of gray or beige, can alone be used for walking about in the streets. On the other hand, colored under-skirts are completely out of fashion it may be black—cashmere or silk—to wear under a black or dark-colored dress; but with all light-colored dresses, such as are generally worn in Summer, it is required to be white, and white only. The under white petticoat is made quite plain, with perhaps a border of Bretonne or fine Torchon lace round the edge; the upper one, that which is worn next to the dress, has one flounce round the bottom, much fuller behind than in front, and trimmed with a deep border of white embroidery, or else with some thread lace. Two gathered flounces are added at the back only, high enough to support the fournure of the dress, and strings are added to tie back the skirt. This is an underskirt to wear with short costumes; to suit trained shaped toilets a train is added, completely flounced from top to bottom, and trimmed at pleasure with embroidery or lace. For walking all dresses are made with short round skirts. In fashions for dresses the greatest variety continues to reign—separate bodices as well as princess robes, and even the polonaise, on condition of submitting to certain rules and modifications. Thus the polonaise, in order to be in accordance with present fashions must be of the same color as the skirt, and draped at the back. The similarity of material is, however, far less indispensable than that of color.

Thus, one sees polonaises of a different material from the skirt, but with their draped back widths of the same fabric as the skirt. This is, indeed, the only case in which it is admitted to use for the polonaise a different material. But, in such a case, the polonaise is reduced to a bodice and two lappets composing the fronts. All the rest of the toilette is of the same tissue as the skirt. In a word, the polonaise all of a piece, all of one material which could be worn with any skirt, no longer exists.

The question how to trim Summer costumes of fancy woolen material is often asked. The fact is the style of trimming remains the same, being of silk of some sort—surah, satin, or brocaded silk—but the arrangement is different. It depends so much, indeed, upon personal taste and fancy that it is difficult to lay down strict rules on the subject; and all we can do is to suggest a few hints. Indian cashmere, Indian veiling, and muslin-delaine look pretty matched with new surahs; and while many are best pleased with bright plaid and Bayadere striped surahs, others prefer the more sober style of plain surah matched to the woolen fabric.

The following is a pretty way of making up a Summer costume of any light woolen tissue, and trimming it with surah, which may be either plain, plaided, striped, or figured.

FIG. 314.

The skirt has two deep pleatings in front, each edged with a band of surah; above this a scarf drapery is pleated upwards across the hips. At the back, the skirt falls from below the basque-edge in soft limp puffs down to a few inches from the bottom, where it is trimmed with three tiny flutings of cashmere; a bow of the surah is placed on the left side, at the junction of the front and back of the skirt, below the hip. The bodice is a basque-waist, round in front, the back pieces, with five seams, prolonged and gathered up into a small puff, with a bow of surah; the basque is trimmed round with a band of surah, the neck with a fine fluting and torsade of the same, which both come down on each side of the bodice, the center being occupied by a row of olive-shaped satin buttons. The sleeves have plain revers and fine flutings of surah; they are, as well as the neck, filled in with crepe lisse flutings.

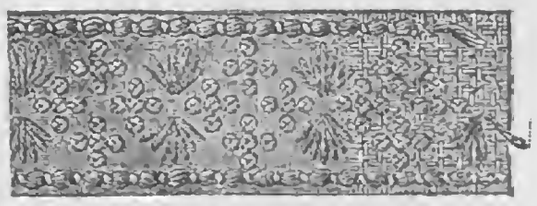

FIG. 315.

As for Summer manties, the visite shape, long or short, and more or less fitted to the waist, is decidedly the favorite; it has no rival but the small mantelet, which will come in for the very warm weather.

CORRESPONDENT'S CORNER.

DEAR MISS CLARK.—Please ask your readers, through the columns of the RURAL, if any one will kindly send me specimens of Pixie (Pyxidanthera barbulata;) Mountain Pike (Phlox subulata;) Dutchman's Breeches (Dielytra cieullaria;) Yellow Corydalus (Corydalus flavula;) March Marigold (Caltha palustris;) Staggerbush, (Andromeda Mariana.) I had all these, but unfortunately have lost them, so cannot complete my herbarium. If possible and desirable, I will exchange for them other, later specimens, from the neighborhood of Philadelphia. Those who wish to favor me, please enclose the pressed flowers in envelopes, send to my address, (Ardmore, Pa.,) and receive my hearty thanks Let them state also what flower they wish, if any. MARGARET B. HARVEY.

In answering "M. E. H.," in issue of June 4, the recipe for making rosemary tea was omitted. We now give it: Take one ounce of rosemary and steep in one quart of boiling water. Let it cool before using. B. & C.

Literary Miscellany.

MARJORIE DAW.

(Continued from page 393.)

"No," said Marjorie, laughing. "I have seen that beautiful Madonna of Raphael's, and you must know she is quite fair. I am a black woman compared with her!"

"Black!" echoed he. "With a throat and brow like alabaster! Oh, Marjorie! my dear, you are far too beautiful to be caught up and married to a village clown!"

Miss Marjorie Daw tossed her head.

"I think I should have to be consulted before I became the wife of a clown."

Old Mr. Peter bent his head and looked admiringly at Marjorie's beautiful averted face.

"You, with your black hair, and dark eyes, and fair skin, are far more lovely than Raphael's 'Belle Jardiniere,' my dear!" said the old man; "and I say that you ought not, you must not, be sacrificed!"

His queer old rough face was crimson from emotion. He was sixty-five years old, a tough, strong old man, whose boast it was that he had never had an ache or a pain in his life. Colds were unknown to him; rheumatism and gout were mere shadows, like the bogies which unprincipled nursemaids conjure up to frighten children. He had never had a headache nor a fit of indigestion in his life. His appetite was excellent. He could sleep on a deal board. He could walk for a whole day, and scarcely feel fatigued. His familiar name in polite circles was the "Rhinoceros," and he knew it, and rejoiced in the title.

He had been a childless widower for thirty years. He had been supposed impervious to the shafts of love during that space of time. His morals were unimpeachable. He had traveled much, but with all this he was a miser—one who ground the last guinea out of his tenants, and refused on principle to do anything to improve the condition of their farms. Add to all this that he was the richest of land-owners, this "great little, poor old rich man"—thus the wicked Marjorie called him behind his back—had fallen desperately in love with the daughter of his tenant Thomas Daw.

CHAPTER II.

Marjorie tossed her head again. She guessed what was coming, and her heart beat fast—oh, so fast! She knew who was waiting for her by the side of the stream—a young man with flashing dark eyes and a stalwart form. How impatient he must be by this time!

"Ah! if the positions were only changed," said Marjorie to herself.

But alas! in this world it sometimes seems to us that people are not in their right places.

"Marjorie, my dear," said old Mr. Peter, and his voice shook, "will you become my wife? Many a high born girl, my dear, would jump for joy if I asked her that question. I will settle all the lands on you, my dear, except the entail; that must pass to my second cousin, of course; unless"—

He did not finish the sentence, but Marjorie understood what great possibilities were offered to her and her children after her.

"We would go away to London in May—to Italy in the Winter—to the Swiss lakes or to the Scotch Highlands in the hot Summers. Oh! what a life! What lovely things he would buy me! How I would dress! I would cut out Mrs. Langtry in the London season! The world at my feet—the world!"

Then she looked at him, and she said to herself

"The world? But the heart empty and hungry? Ah! what a pity one has a heart!—it is in the way of one's happiness!"

And all this while Mr. Peter stood there in his shabby brown coat, waiting for an answer. The red light was fading fast in the pale sky, the shadows were creeping over the woods; the moon was getting up behind the old barn in the rear of the Yarrow Farm.

"He has gone home now!" said Marjorie to herself, thinking of the handsome youth by the side of the stream who was waiting for her. "After all, what has Rufus Gorse to offer me? Not even a humble home! True, there have been times when I have felt that I could be happy with him even in a garret: but that was when we thought he was dying with fever last autumn. I know I should hate a garret, even with *him!*" And Marjorie was right. "Still, I must talk to Rufus first," she said to herself; then aloud:

"Mr. Peter, your offer has made me giddy with surprise; it is too much honor, sir, for me."

"Is that to be my answer, Miss Daw?" said he, in a hard, haughty tone; if so, it does you honor; it is cutting, and yet courteous enough to have been spoken by some beauty in Mayfair."

"I meant no more than I said," Marjorie answered, simply; "really I can hardly believe that I had such an offer."

Old Mr. Peter chuckled; he was pleased again.

"My dear," he said, "it is the truth, and you need not think it such an honor. Your beauty should almost buy you a throne, and my happiness is wrapped up in you. Speak, Marjorie; will you be my wife?"

"Dear Mr. Peter, let me sleep on this; let me think all to-morrow, and then in the evening at this time, I will make up my mind."

"Then am I to come for my answer, Miss Marjorie?"

"No; I will write it this time to-morrow night, and run down to the village and post it; you will have the answer by the day after to-morrow."

"No," said Mr. Peter, "I can't wait my dear; I hate suspense. If you refuse me I shall go away and stay for a couple of years."

Mr. Peter had an odd trick of blinking his eyes when he was agitated; he did so now most furiously even in that faint light; the fact was evident to Marjorie. She had a horrible inclination to laugh—a nervous laugh, half triumph, half fear, half regret.

"Oh, Mr. Peter," she said, "I will tell you to-morrow; I am sorry I can't speak now, but——"

"No, don't—no, don't, my dear!" he interrupted. "Take your time; I can wait until to-morrow night, but not a minute longer, so now I'll go. You can just tell your people that I was passing, and that I came in to see the flowers. One word more, Marjorie: if you refuse me will you keep this a secret? It's a great deal to ask a girl to hide the fact of such an offer, but I think you are generous, my dear, and I do ask you."

But a spirit of coquetry arose in Marjorie.

"I have not refused you yet," she said. "Wait until I do."

So the old Baronet was compelled to be contented with that; he went away after saying good night, and holding Marjorie Daw's hand for a minute within his own.

Marjorie stood at the gate, and watched the figure of the old man, seated on his little sturdy beast, move slowly down the steep lane. Man and horse seemed cut out against the pale, Spring heaven. At last they dipped down out of sight, but Marjorie could still hear the pattering of the pony's feet in the lower road.

She leaned on the gate and listened. The choice of two lines was offered her—splendor without love, or penury made brilliant by the fires of passion. She was proud, capricious, ambitious but her blood ran sometimes like liquid fire in her veins; she was a spoiled girl, but she had a heart. She at this time only guessed at half its depth, its capacity for affection, its yearning for love.

"I suppose," she said to herself, softly, "that I shall become Mrs. Peter; yes, yes, I suppose so. I could do a great deal then for my friends; father's farm should be improved, and he should only pay half the rent he pays now. Some day the lands would be mine! then Rufus—I can help him—give him a thousand pounds, and send him to Italy to study music there, and then he might marry a lady of rank when he became famous. No, no, no, I could not bear that. Poor Mr. Peter is old though so strong. When one is sixty-five one can't expect to keep on living always."

"Ah," said a musical voice, tinged, though only pleasantly, "ah, faithless one! I have waited for you, Marjorie, until my heart felt heavy as lead. Why did you not come, then, as you promised?"

The young lover stood in the moonlight, a very different figure from old Mr. Peter, a tall, erect fellow, with a certain manly grace of attitude. His face was beautiful, Marjorie thought as some exquisite cameo. The lines of level brow and curved nostril and finely-moulded upper lip were so pure. Certainly Rufus Gorse, Village schoolmaster, and organist of the tiny parish church, was handsome enough to attract the attention of the fine visitors in the squire's pew on Sundays. He had such deep-set flashing gray eyes, with so many lights and shadows in them, and the whole expression of the face was at once so manly and so sweet.

"What kept you away, my Marjorie?" asked Rufus again.

"Not your Marjorie yet," she said sadly; and then she added, impulsively, "Oh! Rufus, I wish that you were rich, or that I were rich, that would do as well!"

"My darling," he answered, simply, in a voice that shook with passionate joy, for were not the girl's words a confession of love? He came up to the gate and laid his hand—his firm, warm, strong hand—upon her shoulder, "Will you promise to be my wife, Marjorie?"

"Oh, Rufus, you have asked me that before. You know that my father has only about five hundred pounds to give me, and the old furniture at the Yarrow, when he and mother die, and you have nothing."

He took his hand from her shoulder, stood back a little way, and folded his arms.

"I have nothing, Miss Daw, that is true, only my love and my life to lay at your feet. But, Marjorie,"—drawing a little nearer to her—"if you will give me time, I will make money—a fortune even—in time."

"Yes, when we are both old," said Marjorie, sulkily. "Who wants to wear satin and diamonds for the first time when one is wrinkled and gray?"

He laughed softly, for he loved Marjorie. He was accustomed to her caprices, and he believed that she loved him in her heart.

"My darling, I will promise to give you a handsome home, long—long before your hair is gray; but must you wear diamonds, Marjorie?"

"I should love to wear diamonds!" she answered, sulkily.

She had a little piece of sharpened stick in her hand, and she was scraping the gate with it and looking down at it pettingly, just as a child might who is out of temper when refused some treat.

"Diamonds!" he said, looking up into the sky and smiling. "I did not know you had set your mind on royal gems so strongly. Well, Marjorie, I will buy you a diamond ring of betrothal before this day twelvemonth—will that do?"

But Marjorie, still scraping away with her bit of wood, was thinking of the splendid family jewels up at Beaucourt, and the single diamond ring, for which she must wait a whole year, looked paltry in her eyes.

"No, Rufus; if I can't have everything to match I don't want one diamond ring!"

"My darling Marjorie, I can never hope to make all your daily life ablaze with diamonds; I am not a prince."

"No," said Marjorie, to herself; but Mr. Peter has five thousand a year!"

"Then, Marjorie, do you refuse me?"

"Not quite; I like you—you know that."

"Then you accept me?"

He came up to the gate and laid his hand again upon her shoulder.

"Not quite," said Marjorie, without looking up.

"Marjorie, why do you so delight in torturing me? it is not noble."

"I don't profess nobility," she said.

In her heart she was terribly perplexed.

This Rufus Gorse she respected more than any human being under the sun, but she was not sure if she loved him quite passionately enough to accept penury for his sake. At the same time, she knew that she could not confess to him that she was inclined to sell herself to old Mr. Peter for the sake of position, without feeling a deep sense of shame. She knew the lofty contempt in which Rufus held such barters of soul and body.

"Then you won't give me your answer to-night, Marjorie?" he said sadly.

All the same, he was daring enough to stoop and imprint a light kiss on her white brow.

She thrilled at the caress; It was almost the first he had ever bestowed on her, though he had been talking of his love for her for the last year.

She looked up now and extended her hand.

"Good night, Rufus," she said; "in a day or two I will give you my answer. Leave me now to think."

He clasped her hand and walked away without another word.

"She has some new, strange notion in her head," he said; "somebody, perhaps, has been setting her against me."

For when one is very much in love, even if one is naturally wise and calm, one is apt to take all sorts of foolish notions into one's head.

CHAPTER III.

Rufus Gorse was only the son of a very poor farmer in the neighboring county; he had a crowd of young brothers and sisters; but from his childhood he had manifested a love for books and a talent for music.

He only went at first to the village school, but after that interest was found and he was sent to a training-college, and there developed so great a musical genius, that he was instructed in the piano and organ free of cost.

Afterwards the humble appointment of schoolmaster and organist in the village of Barwell fell to his lot, and there he fell madly in love with Marjorie Daw—madly, for he would have sacrificed himself in any way to win her; and though he was ambitious, and had his grand dream of one day making his mark in the world in the shape of an oratorio or an opera, he still felt that the brightest crown that earth could offer him would be but as a paltry wreath of paper flowers unless Marjorie were by his side.

As for Marjorie, she went into the house presently, bright, bustling, as if nothing had happened. The Williamses were to stay to supper, so she helped her aunt to lay it in the great kitchen. Her father, a warm-hearted, simple-minded man, came in cheerful and hungry.

She was chaffed about her interview with the landlord, who had only gone with her into the garden to see her tulips.

"Since thee is such a favorite with the old man, lass," said Thomas Daw, "I wish thee would ask him to put a new roof on to the barn."

Marjorie smiled.

"So I will," she said.—[To be continued.

NEW PUBLICATIONS.

A Nameless Nobleman.—Boston. James R. Osgood & Co., Publishers. Price $1.00.

This is the title of the first volume of the "Round-Robin" Series of anonymous novels, which is to contain works of prominent American writers. The nameless author of "A Nameless Nobleman," while outlining the characters of the story with delicate precision and consummate art, has given them free life and movement in a most ingenious and complicated plot, equally removed from sensationalism and from dullness. The scenes are laid in Paris and Provence, Quebec and New England, and the actors are French nobles and Puritan rustics, moving in the most quaint and picturesque years of the colonial era. The interest will not be diminished when it is known that the plot is founded on the actual traditions of an honorable family in the Old Colony or Massachusetts,—a region where ancestral legends are handed down for centuries, with religious care.

The Beacon Light.—A collection of Hymns and Tunes for Sunday Schools. By J. H. Tenney and E. A. Hoffman. New York: Oliver Ditson & Co., Publishers. Price 30 cents.

One more new collection of Sunday School songs. Although there are many, the demand is large, and new ones are not objectionable, provided they are up to a high standard. The compilers announce that out of a large pile of manuscript, only about one in five songs were chosen, as first-class ones for the book and its contents may therefore be considered as choice. It will be noticed that very many of the songs are in unison with the pretty title page and its motto:

"I am the Light, the true Light, which lighteth every man that cometh in the world."

How Persons Afflicted with Bright's Disease ought to Live. By Joseph F. Edwards, M. D., Philadelphia; Presley Blakiston, Publisher.

Nothing would seem to be of much more value in a physiological point of view than a work on the subject of kidney disease. There has been so great an increase or (probably more properly speaking) development of this complaint that an intelligent consideration of the necessary precautions of those afflicted should meet with universal approbation. Explanation of symptoms and clear, common sense revelation of the proper mode of living is the object of this treatise, and the author has succeeded well in the transmission of knowledge.

We have received a roll of attractive music from O. Ditson & Co., and notice in it, first, a song for Decoration Day, entitled "Lay the Flowers Lovingly;" a powerful ballad by Edward Oxenford, called "The King's Champion;" and one of Stephen Adam's inimitable sea songs, by the name of "Ben Lee." There is also a Waltz for Piano, from the new and popular opera, "The Mascot;" a rustic dance, "Les Paysans;" and one of Smallwood's pretty lesson pieces, "Jenny of the Mill." With the music we also receive a copy of Ditson & Co's. Musical Record, which is a standard in the way of musical news, and costs $2 per year.

Stories of the Arabian Nights—Edited by Samuel Eliot. Boston: Lee & Shepard, Publishers.

The stories are authorized for use in the Boston public schools. In the words of the preface: "These tales are perhaps Arabian, perhaps Persian, or Indian, in their origin. At all events, they come from a different world than ours, and have the charm that belongs to highly imaginative literature. Their appeal to the imagination of our children is the reason for introducing a few of the best among them into the schools."

Theological Unrest.—Discussions in Science and Religion. New York: A. S. Barnes & Co., Publishers. Price, 25 cents.

This is one of the Atlas Series of Essays. Its contents are: Science and Theology—Ancient and Modern; Parts I., II. and III., by James Anthony Froude; Conflict of Religion and Science. By Rev. E. A. Washburn, D. D. This one, with others of the series, is certainly of great interest, and no doubt will be appreciated by the thinking minds.

Short Studies of American Authors.—By Thomas W. Higginson. New York: Lee & Shepard, Publishers, Price 75c.

This little book is a revision of brief papers published in "The Literary World." Hawthorne; Poe; Thoreau; Howells; Helen Jackson and Henry James, Jr., are the writers considered. This is particularly interesting.

Country Love and City Life.—By Charles Henry St. John, Boston: A. Williams & Co., Publishers.

The above is a title of a selection of poems originally designed for public recitation, but later clothed in book form. We trust the contents may be appreciated as much in the new relation.

MAGAZINES FOR JUNE.

The American Naturalist.—Contents: Archæology of Vermont; Larval Habits of Beetles; Late Explorations in the Gaboon; Pueblo Pottery; Recent Literature; General Notes; Botany; Zoology; Entomology; Anthropology; Geology and Paleontology; Geography and Travels; Microscopy; Scientific News; Proceedings of Scientific Societies; Selected Articles in Scientific Serials.

Ancient Works in New York.—There are within ten miles of Watertown, N. Y., many ancient fortified village sites, not to speak of those obliterated by the plow. We cannot use the term mound as applicable to this locality, for there are no artificially constructed mounds found here. One of the most marked features is that all these sites were fortified or defended with ditches. They are nearly all located upon the sandy moraines of extinct Adirondac glaciers, or sand-strewn hills. A few fishing stations along the shores of Lake Ontario and Black River Bay are the exceptions, and even these are upon sandy slopes. There seems to be no uniformity in the shape or construction of the lines of defence; one at Black River Bay had the ditches in the form of circles, one within the other, and a lunette towards the water, with a protected roadway to the shore. One in Rutland, on the farm of Mr. Gragg, has the trench cut across the base of a peninsula, between two forks of Sandy Creek, a steep hill serving as embankment for the rest of the inclosure, and usually the lines run along the edges of an escarpment. I am informed by several of our elderly inhabitants that these lines of entrenchments near our cemetery were a mile and a half long, and some of the trenches five feet deep. Pottery of the usual forms, and nearly always broken into small pieces, is a constant accompaniment of these fortified sites, and and it is generally blackened on the inside with charred food, showing that the owners cooked with heated stones thrown into the vessels. The jar or pot, the most perfect specimens I have met with, was dug up in the town of Rutland many years since, and is owned by Mr. J. A. Lawyer of this city. Arrow-heads, stone axes, scrapers, knives, bone awls, charred corn, etc., found West and South, are dug up from the graves of these people, or strew the sites of their homes.—David S. Marvin in Am. Naturalist.

Scribner's Magazine. Contents:—The Remedy: The Farragut Monument; An August Morning with Farragut; Sketch of the late Earl of Beaconsfield; Joan of Arc listening to the Voices; The Westminster Play; Some New Berries; Practical Floriculture; A Fearful Responsibility; A Rainy Day with Uncle Remus; Madame Delphine; Fritz; Along the North Shore of Long Island; Lobster-fishing and Lobster Canning; The Largest Extinct Volcano; Poems; Sic Semper Liberatoribus: Farragut; Latitude Unknown; Poems from a Scrap-book.

How New York should dispose of its Refuse Matter.—The first idea that suggests itself to all who consider such questions is that, in the interest of the people, the immense amount of fertilizing matter contained in the offscourings of such a population as that of New York should be turned to profitable account. Experiments in this direction have been made and are being made at London, Berlin, Paris, Danzic and elsewhere. Thus far, all that has been proven in its favor is that it offers a good means for the purification of the effluent. The hope of profit, or, indeed, of any important return for the cost of the work, has apparently been abandoned. Possibly at some future time a change of the agricultural conditions of the country may enable us to realize this theoretical profit. At present the only aim that can be pursued with the hope of success is the purification or the inoffensive disposal of the effluent matters. Their discharge into the deep water of the Atlantic Ocean at a point off some unoccupied portion of the south shore of Long Island, were this possible, would be entirely satisfactory. Their disposal in wide surface irrigation on the sandy land of the Long Island coast would secure such

purification that the effluent might flow off from the shore without offense or danger. The area required for this purpose would be large, and the operation would be costly; but some form of disposal which shall secure the purification of the harbor is sure to become in time, if indeed it is not now, a commanding necessity. Whatever the system adopted, and whatever the means of purification, it is already manifest, that the proper disposal of the entire sewerage, not only of New York but equally of Brooklyn, cannot be too early taken into serious consideration.—Colonel Waring, in Scribner for July.

HARPER'S.—CONTENTS:—The White Mountains; The Dead Child and the Mocking-Bird; The Mad Maydes Songe; Our Ruby-Throat; A Neglected Corner of Europe, I. Lisbon; Ballads and Ballad Music Illustrating Shakspeare; Edwin Booth, William Winter; Anne, A Novel; Benedetto Civiletti; The First Settler's Story; The Trial of Jeanne Darc; Mrs. Millington and her Librarian; Kentucky Farms; A Laodicean; Editor's Easy Chair; Editor's Literary Record; Editor's Historical Record; Editor's Drawer.

WARS OF THE HUMMING BIRDS.—Whenever it happens that two of the species meet among my flowers, they signal the encounter with a shrill war-cry, and dash at each other in fierce antagonism. The spirit of Bellona inflames their souls. For an instant they close together, then give each other chase, and with the speed of meteors are lost to my view. Shortly after, the return of one alone announces that the victory has been quick and decisive. Diminutive as are these puny sprites, they are heavily charged with combativeness. The entire race are pugnacious and quarrelsome to an extraordinary degree, impudently assaulting each other, and birds of much greater size which venture into their neighborhood or occasion them a fancied annoyance. Even the hawk is not safe from their attacks, and has been seen worried and whipped by them. Mr. Bates remarks, in delineating their truculent disposition, and the perpetual battles occurring in every flowery nook in the tropics where they congregate, "One will knock another off its perch, and the two will go fighting and screaming away at a pace hardly to be followed by the eye."—MRS. SARA A. HUBBARD, in Harper's Magazine for June.

ST. NICHOLAS.—Contents: Frontispiece; The A. Steeles; What the Birds Say; The Lost Stoppor; How Shocking! verses; The Mastiff and his Master: Enchantment, verses; Ostrich Farming; "Candy is Not Good for Children," picture; Phaeton Rogers; The Fountain in the Park; Butterflies, poem; "The Children's Artist;" Pease-Porridge Cold; A Quiet Time for All Concerned, picture; The Frog's Tea-party, verses; In Nature's Wonderland, Chapter VIII.; Was Kitty Cured? "Strawberries! Ripe Strawberries!" The Month of Roses, picture; The Treasure-box of English Literature; Saltillo Boys, Chapters IV., V. and VI.; An Italian Fisher Boy Mending his Nets; The Giant Picture Book; For Very Little Folk; Jack in-the-Pulpit; The Letter-box; The Riddle-box

"STRAWBERRIES, RIPE STRAWBERRIES!"

"Strawberries! Ripe strawberries!"
Shouted big Johnny Strong:
And he sold his baskets readily
To folks who came along.

But soon a tiny voice piped forth,
"Me, too!" Nell could not shout
As John did. Yet she too must sell
The fruit she bore about.

"Ho, straw-berr-e-e-s!" roared lusty John.
"Me, too!" piped Nell, so sad.
And Johnny made good sales that day,
But Nell sold all she had.
—St. Nicholas for June, 1881.

PHRENOLOGICAL JOURNAL.—Contents: William Windom; Responsibilities of Genius; Studies in Comparative Phrenology; Does Death End All? Sir Josiah Mason; Plant Organization; Some Thoughts on the Problem of Poverty; A Puritan Child; The Young Folks of Cherry Avenue; What is a Cold? Hygiene of Railway Travel; Bread-mold in the Microscope; Notes in Science and Agriculture; Editorial Items; Answers to Correspondents; Personal—Wisdom and Mirth—Library—Publisher's Department.

Physicians of all Schools use and recommend Hop Bitters; take their advice.—*Adv.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CONCERNING HOUSEHOLD HELPS—CONCLUSION.

MARY WAGER-FISHER.

THE greatest difficulty lies with women who have kind husbands, but whose circumstances are such that it seems impractical or extravagant to hire help even when it can be had, and the strength of the wife is overtaxed to meet the deficiencies of income. She is ambitious and economical, and desirous of "getting on" in the world, and still intelligent enough to see that she *is* overworking, but obliged, as she *thinks*, to keep on overtaxing herself, and all the time hoping for more ease in the future.

For such women there is nothing to do but to stop at once, and let things go, just the same as if they were sick or unable to get about. When I I was a young girl I was extremely fond of needlework, and often applied myself so closely to it as to produce a "pain in my shoulder." My father, upon learning of it, commanded me, with great severity, to drop my work of any and all kinds the moment I felt the pain; and the discipline was one that I commend to others, and especially to all women who are mothers. In the family the life and health of the mother is the highest of all considerations. It is better for children to grow up in poverty than to be deprived of their mother, and the mother should make it a rule of her life to save herself at all cost. To wear one's-self out in cooking, cleaning, sewing and mending that is not absolutely essential is rank folly, and I am convinced that the majority of women who overwork themselves do so in the performance of work that is *not* absolutely necessary. Some mothers, for the sake of keeping the children in school *every* day, will never keep one at home on the busiest day to take steps for her that she well knows should be taken. The "last straw" of others is in scrubbing and scouring, in running the sewing machine, in making a rag carpet, in spraining the back at house-cleaning time by lifting heavy things, or in getting up an elaborate dinner. A physician said to me not long ago, "The curse of American women is having a pain in the back; it means being TOO MUCH ON THE FEET." And undoubtedly the greatest and most important reform, fraught with the highest benefits to the American nation, would consist in inducing American women, at all hazard, to take better care of their health. The first and chief thing in the rearing of a daughter is to make her a fine animal, and to so thoroughly permeate her mind with the idea that she must take such intelligent care of herself that her health will always be robust and perfect, as to make it the great fact of her existence, and that if it be the chief end of man to glorify God and enjoy Him forever, in the language of the catechism, it is the chief end of woman to have good health. A healthy woman in her very existence of sweetness and beauty glorifies her Creator, and she certainly enjoys Him and His creations infinitely more than can a woman who has no health in her.

With many women Sunday is no more a day of rest than Monday. To such let me commend the way of a lady whom I know, and who is a very rare lady, indeed, in the best sense of the word. It is a law in her household that on Sunday no work but what is purely essential shall be done. If the floors get dirty, or things get out of order, they remain so. There is no sweeping, or "brushing up," or ordering of things. Her idea is that in the week there shall be *one* day of almost total abstinence from work, and she makes that day Sunday. It would be well if all women would oblige themselves to observe certain hours *every* day for sitting down—*come what will*. I believe it is the only safe way.

Another very safe way for farmerines is to sit out-of-doors. Many country women live more indoors than city women do. After the work of the house is over, instead of sitting in the open air, they drop into a rocking-chair in the house for their rest. When there is a cool, shady porch or tree near the door, it will be found refreshing to do as much work as is possible there, away from the heat of the kitchen. Vegetables can be prepared, fruit picked over, and all the sewing and repairing during Summer can be pleasantly accomplished in the open air. It saves, too, a great deal of litter and dirt in the house. In order to restfully enjoy a porch it needs furniture, such as comfortable chairs, a table, and if one has an old lounge or settee for it, it will be found that the "men folks" will "take to it," and thereby save much sweeping, dusting and cleaning in the house. Hang a rack or pocket for newspapers there, too.

There are some things that seem to result in precisely the opposite way to what they should. One would suppose that farmers' wives, for example, living in the country, and commanding pure and nutritious food, would be rosy-cheeked, plump and fresh-looking, while the fact is, they lose their youth and fine color sooner than any other class of women. They have a faded, thin, dragged out appearance by the time they are forty, that no woman ought ever to have at any age. I think it is better to wear out, than to rust out. But I know of nothing that earth can give that equals in value good health, or is a compensation for a broken-down body. And when women work beyond all reason, do they ask themselves, "for what good?" If a woman loves her husband who loves her, and loves her children, in what better way can she express her affection for them than by taking the best possible care of herself, so that her life may long be spared to comfort and counsel them? We all are apt to make one common mistake, and that is, to act upon the idea that what we *do* for our loved ones, is worth more to them than what we *are* to them. This is all wrong. A mother who is a complete invalid, may be worth more to her family than any twelve women who can work. To put the whole matter in a nut shell, any woman who works beyond her strength, unless in an extraordinary case of life and death, is, without question, foolish beyond excuse. Nobody in her family loves her better for it. She gains nothing by it in the long run, and loses in the end. If I could put what I feel in regard to this weakness of women, into words, I am sure that every mother who reads this would take better care of her health than ever before. My own mother was one of those delicate, ambitious women sacrificing herself without stint to her family, and she broke down at the early age of thirty-eight, and her children were left motherless. I never think of her untimely death, of her unnecessarily laborious life, of her ambition for her children gratified at such a terrible cost, without a feeling of indignation that so valuable a life as hers was sacrificed for such paltry considerations. And there are thousands of mothers such as she was. May they be warned of their folly before it be too late.

There is a vast difference in men. Occasionally there is a man who protects his wife against herself, but as a rule, if a woman is inclined to be careless, indifferent, or stupid in regard to overtaxing herself, her husband will not be a stumbling block in the way of her shortening her life, so that if a woman does not look out for herself, she will be poorly looked after. And so long as she has common sense she ought to look after her own welfare. That is what she was given brains for, and she should not expect others to do for her what she should do for herself. The instinct of self preservation is probably the strongest instinct our Creator has placed within us, and we ought to remember always that in order to preserve our bodies, we must use our strength with due moderation. There is nothing more delightful and enjoyable, than to be able to work with enjoyment, to feel strong and full of vigor, and to maintain this ability to the very end of a long life, is to use life to the very best advantage, so far as happiness is concerned. So, remember that *life* is *more* than meat, and the *body* more than raiment.

As for "busy seasons" on the farm, do not allow yourselves to be overtaxed then. If men can be hired for the farm, have one detailed a part of each day, or so much as is necessary, to help in the house. Such help should be as much a part of seed time and harvest in-doors as out-of-doors. And *insist* upon having the help, for it is better that grain go ungathered than that you make yourself ill by overwork.

Here in the East, we hear much of the efficiency and cheapness of Chinese "help" in the house in the West. If any RURAL-reading woman has such help, I for one will be glad to have her give her opinion thereupon.

DRINKS FOR HOT DAYS.

Lemon Sirup.

SQUEEZE the juice from 12 good-sized lemons, grate the rind of half into it and let it stand over night. In the morning strain, squeezing as much oil from the grated rind as suits your taste, add to it six pounds of white sugar and boil until it becomes thick. Bottle and cork. A tablespoonful of this sirup in a glass of cold water makes a very refreshing drink.

Raspberry Vinegar.

Fill a stone jar with raspberries, red or black, cover with pure, strong vinegar and let stand a week. Then strain, pressing out all of the juice from the berries. To each pint of this liquid add a pound and a half of lump or granulated sugar and let boil until the sugar dissolves, removing scum that may arise. Let cool, bottle and cork tightly. Two tablespoonfuls of this in a glass of ice water make a delicious drink.

Cream Nectar.

Two pounds of lump or granulated sugar, two ounces of tartaric acid, juice of one lemon, half a cup of flour mixed smooth in a little water, and three pints of water. Boil five minutes. When cold stir in the whites of three eggs beaten to a stiff froth and a half ounce of wintergreen or any other flavoring one may fancy. Bottle and keep in a cool place. When wanted put a fourth teaspoonful of soda into a glass of ice water and then add two tablespoonfuls of this sirup.

DOMESTIC RECIPES.

Cabbage Salad.

A SMALL, firm head of cabbage sliced fine, a cup of good vinegar, a tablespoonful of butter, two beaten eggs, a tablespoonful of sugar, pepper and salt, and a cup of rich, new milk or thin cream. Put the vinegar on to boil, add the butter, sugar, salt and pepper. When almost boiling stir in the chopped cabbage. Scald but do not let boil. Have the milk or cream heating in another vessel; when it boils thicken with the beaten eggs. Turn the scalded cabbage into a deep dish, pour over the thickened milk, toss up the mixture, cover and place where it will cool at once. Serve cold and garnish, if you like, with cold boiled eggs.

Snow Cakes.

One scant cup of butter, two cups of white sugar, a small cup of milk, whites of five eggs, three cups—rounding full—of sifted flour, two teaspoonfuls of baking powder sifted with flour, vanilla or lemon flavoring. Bake in small round tins.

Chocolate Caramels.

Into a saucepan put one cup of thick sweet cream, two cups of brown sugar, a tablespoonful of corn starch stirred smooth in a little of the cream, a tablespoonful of butter, and a bit of soda, size of a pea. Boil slowly half an hour, stirring to prevent burning. Mix smooth with a little cream or milk seven tablespoonfuls of grated or scraped chocolate. Draw the saucepan to the side of the range and add the chocolate. Put over the fire and boil ten minutes longer, stirring constantly. When it makes a firm, glossy coat on the spoon it is done. Flavor with vanilla just as you take from the fire. Pour into buttered, shallow tins. When firm enough check with a knife into squares. Milk may be substituted for the cream, but add another spoonful of butter.

Ripe Currant Pie.

One coffee-cupful of crushed currants, one of sugar, a tablespoonful of flour mixed smooth in one of water, yelks of two eggs. Bake with an under-crust only. Beat the whites stiff, sift in two spoonfuls of powdered sugar, spread over the top of pie and slightly brown in oven. MARY B.

Bread-making.

The following is an improvement in bread-making: At noon throw the scalding hot potato water on a pint of flour, stirring in two or three mashed potatoes. When tepid add a small cup of yeast and set it away until evening. Then make corn mush, one part to three of flour, mixing in hot weather with cold water, and in cold weather with warm water. In the morning it is ready to make into loaves and by the time the oven is hot they will be light enough to bake. In this way the housewife can get her baking all out of the way by eight o'clock in the morning. P.

A Cheap and Good Paint.

Make of unslaked lime, two gallons of white wash, add to it two and a half pounds of brown sugar and three ounces of salt. This, when applied, becomes perfectly hard and glossy. By mixing lampblack a beautiful lead color can be obtained; for yellow, yellow ochre; for red, venetian red. This is a strong and durable paint. RUTH.

Don't physic, for it weakens and destroys, but use Hop Bitters, that builds up, up!—*Adv.*

News of the Week.

HOME NEWS.

MONDAY, June 13, 1881.

There was a little excitement at Albany on the 9th inst., when Assemblyman Bradley informed the House that he had received $2,000 to vote for Depew. The money was handed him on the evening of the 8th, and Bradley, considering it a bribe, handed the money over at once to Speaker Sharpe. When the voting took place on Thursday Mr. Bradley said that he had received the amount mentioned and had handed it to the Speaker, which statement the Speaker verified. Mr. Bradley called for the appointment of a committee to investigate the charges of attempted bribery. The committee consisted of seven and its jurisdiction was extended to comprise in its investigations any other cases of bribery which may be discovered. At the first meeting of the committee the testimony of Mr. Bradley was heard but nothing definite was accomplished. The charges of bribery were laid upon Senator Sessions, who appeared before the committee and denied them *in toto*, but did not deny that he had tried to persuade Mr. Bradley to vote for Depew. "Much excitement" is predicted for this week and it is thought that some of the leaders of both factions will have a chance to tell what they know about the bribery case. The voting for Senators has not changed materially during the past week.

THE New York State Press Association held its annual meeting this year at Utica. Geo. Wm. Curtis delivered the oration. Ellis Roberts of the Utica Herald gave a reception to the members on the evening of the 9th. On the 10th inst. the party took a trip to the Thousand Islands. The next convention will be held at Jamestown, Chautauqua County.

On Tuesday the 1st, the Whittaker trial was brought to an end by Major Gardner's summing up for the Government. The Court met again in secret session on Friday, but the public will not know the result of its deliberations until the President announces his approval or disapproval of the decision of the Court. It is said that the total cost, to all parties, of this trial and the Court of Inquiry at West Point is $37,500.

The graduating exercises at West Point Military Academy and at the Annapolis Naval Academy took place on the 9th inst. There were 52 graduates at West Point, of whom John Mills of Michigan stood first. At the naval academy John S. Schock of Pennsylvania ranked first in a class of 67.

A terrible conflagration destroyed nearly a fifth portion of Quebec, Canada, on the 9th inst. It is said that 1,500 families are made homeless, and the total loss it is thought will reach $2,000,000. The fire originated in a stable, and the alarm not being given promptly, it soon became impossible for the firemen to control the flames. Complaint of a lack of water is made. The magnificent edifice known as St. John's church, worth $100,000, was reduced to ruins.

The recent heavy rains have caused a great destruction of property in the Alleghany region in Pennsylvania. Travel has been entirely obstructed on some railways by wash-outs and land slides, the loss in lumber washed down stream is great, and dwelling houses in Alleghany City were submerged. At Oil City railroads were abandoned and hundreds of acres of land were under water.

The position of Commissioner of Deeds, to which Fred Douglass has been appointed, is worth $7,000 a year. Sheridan, who was displaced by Douglass, says he liked the position and told the President he wanted to keep it, although he was overworked. His office hours were from half past 12 to quarter of 1 every other Wednesday. Well, $18 a minute for actual office work isn't bad.

East St. Louis has been lighted by the tower electric lamp system, the water tower on the river, a building over 200 feet high, being utilized for this purpose. On this a light of 32,000 candle power was fixed. The experiment was a success, lighting up the town and river for over a mile at a cost of $5 a night.

They have discovered a receipt for the sale of waste paper by Pitney, of the Treasury Department for $2,000. The cash book was examined and no entry of the item was discovered anywhere. Pitney can't explain. That's the way the money goes.

Mrs. James Vick, Sr., mother of the Rochester florist, died last week. She was a remarkably kind-hearted and self-sacrificing woman.

A terrible hail and rain storm passed over Deadwood, D. T., lately, doing great damage. Hailstones of the size of hen's eggs fell for over two hours. One stone measured over 22 inches in circumference. The whirlwind struck in Deadwood gulch, near the confluence of Whitewood and Deadwood gulches, completely destroying four houses, killing one woman, and seriously injuring three other persons. Hundreds of trees on the hillside were uprooted and hurled, in some instances, a distance of 500 feet. Telegraph poles were torn up for a distance of nearly a mile.

St. Louis has begun the war with the inevitable. A number of her wealthy citizens have signed a vigorous protest regarding the charter of an elevated railway, at present under contemplation. The protest would be more formidable were it not for the fact that equally wealthy and influential citizens urge the establishment of such a road.

A memorial Hall erected at Brown University, Providence, R. I, by the Hon. William F. Sayles, as a monument to the memory of his son, has just been presented to the Corporation of the College.

Mrs Garfield who has been sick for several weeks with malarial fever is recovering, and the Presidental family will soon leave the malarial atmosphere of the White House for the more wholesome air of the Soldier's Home.

Had Slept Little for Forty-Eight Hours.

A gentleman writes: "I had an acute attack of *Bronchitis and Asthma* when the Compound Oxygen Treatment arrived, and had slept but little for forty-eight hours. Took Treatment for two days. My Bronchitis and Asthma about gone." Treatise on "Compound Oxygen sent free. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia Pa.—*Adv.*

AGRICULTURAL NEWS.

Gov. Cornell of this State, has vetoed as unconstitutional the Sheldon anti-oleomargarine bill which provided that wherever the stuff was used in hotels, restaurants and boarding-houses, notices should be conspicuously put up to the effect that "imitation butter" was used there. The same unhappy fate for the same reason has befallen the Fenner anti-oleomargarine bill which was gotten up as the result of the visit to this city of that nincompoop investigating committee. Long ago we expressed our fear that these bills would never become law, and although Fenner's bill was amended somewhat in accordance with our suggestions, the amendments were not radical enough. It is to be hoped that by next session of the Legislature a bill will be framed wisely enough to escape the dangers which have killed these abortions. .....The freight on wheat from N. Y. to Liverpool is 4s. 6d. per ton; the railway rate from Liverpool to Birmingham is 12s. 6d.....News comes from Algiers that in the departments of Oran and Constantine cereals, fruits and vegetables are all lost. The French settlers are selling their beasts of burden and the natives their flocks for a mere nothing, as it is impossible to find feed for them.

In Boyle County, Ky., the fly has almost destroyed the wheat crop.....Locusts are splitting the limbs of fruit trees in Oconee County, S. C., so that they die..... About two-thirds of the apples in Ohio have blighted and fallen off the trees... ....Wheat birds have totally destroyed large fields of the growing grain of McLennan County, Texas.....In Fannin County, Texas, grasshoppers are found in millions, and farmers are in a great state of alarm..... Nevada is completely overrun with grasshoppers. They consume a crop, leaving nothing green behind them. .....The farmers around Kirksville, Mo., report the country alive with chinch bugs that are doing great damage to the crops.....Grasshoppers are on the march on the Truckee, Cal., meadows. They ate up forty acres of prime wheat for one farmer.....The corn in much of the State of Indiana has been so thoroughly damaged by wire worms and grubs that replanting has become necessary.....The North Carolina locusts are doing great damage to young apple orchards. They split the fruit-bearing twigs, which soon wither and fall to the ground.....Grubs or frost have made very many missing hills among the hop fields of Oneida, N. Y. Many new fields are being set out, but the crop will be short for a year..... Reports from Strausstown, Pa., say that the army-worm is destroying the corn as fast as it makes its appearance above the ground. It ruins a tobacco field in a single night.....A parasite has appeared in the orange groves of the West Indies, Florida and California that has ruined vast numbers of trees, and threatens to seriously interfere with orange culture..... Kitchen gardens in Bergen County, N. J., are many of them ruined through the cut-worm and rose bug. Tomatoes are now in blossom and melons in their their third leaf, but the worm turns the former upside down by cutting it off just under the ground, while the bugs will eat up every vestige of the latter in a few hours..... The Charlotte, (N. C.) Observer announces the appearance of the seventeen-year locusts in that vicinity by millions, and they are eating up everything. It says: "They cover the landscape over with their yellowish-brown damask wings like Summer dusters on parlor furniture. They come, millions upon millions, they come. From every direction they call to each other, 'Come over here and help us eat them up.' The woods are filled with them; the ground is alive with them."..... ....The chestnut trees around Echo Lake, in Passaic County, N. J., look as if scorched by fire. A pink-headed worm three-quarters of an inch long is found rolled up in the leaves. The pests have so thoroughly sapped the trees that it is thought they will die.....At Carrolton, Ill., since May 20 locusts have been coming out of the ground until now the woods and orchards are resonant with their music.....At Vandalia, Ill., the woods are full of them, and persons riding on railway trains in passing through woodlands can distinctly hear the din of the locusts above the rattle of the cars... ....At Belleville, Ill., their numbers are beyond computation.....At Eldorado, Ill., a woman died after eating some mulberries which were supposed to have been impregnated with locust eggs.....At Paducah, Ky., the locusts are swarming in myriads, and the noise made by them is a matter of complaint to those who live in suburban places,.....At Little Rock, Fort Smith and Hot Springs, Ark., they appeared recently in large quantities but have disappeared.....At Mobile they are making deafening noises in the woods. The locusts are not generally destructive, but they frequently injure young orchards and occasionally sting a human being, sometimes fatally.....It is stated that the Canada Pacific Railway Company has sold to a group of French agriculturists 200,000 acres of land at $1.25 per acre, and that the buyers intend to colonize the land and promote Canadian competition with the United States.

Mr. Gladstone has become a life member of the Edinburgh Agricultural Society.....The island of Cyprus is overrun with locusts, which are making fearful ravages among the wheat crop.....

The Kansas Supreme Court has decided in a recent case that if a farmer stacks his hay "near" the railroad track (in this instance it was 150 yards away), he is bound to take notice of the increased danger and guard against fire. If he does not, he is guilty of contributory negligence.....Whole fields of promising strawberries have been ruined in Long Island by a minute wire-worm that attacks the roots.....A dispatch to the Chicago Evening Journal from Des Moines says that the losses to Iowa farmers this year from poor seed will amount to $2,000,000... ....The Short-horn breeders of Canada have formed an association, the principal object of which is to establish a Canadian herd-book with a higher standard than that which obtains in the herd-book now published by the Agricultural and Arts Association The latter publication will now cease..... ...The London Mark Lane Express of the 6th inst. says:—"Wheat made a strong and healthy growth under last week's brilliant Summer weather. All other crops are retarded by the same cause, except where there have been occasional thunder showers. A steady rain Sunday and throughout the night will greatly help all crops."

Entries for the fifth volume of the Holstein Herd Book will close July 1st, 1881. Blank forms for application for record and transfer of animals, also for milk record, will be furnished by the Secretary, T. B. Wales, Jr., So. Farmingham, Mass. Owners of Holstein cattle desiring to have records of butter published in the Herd Book, may forward the same to Mr. Gerrit S. Miller, Peterboro, N. Y. .....The following from upper Silesia three month ago throws light upon the enormous arrivals at Castle Garden: "No grain, no potatoes, no food for cattle, no seed for sowing. Snow and cold without, hunger and sickness within," Soup houses and public kitchens have been started in seventeen villages.

Reports were received in this city yesterday to the effect that the recent rain storms would injure the crops in Western States. It was stated that in the southern part of Illinois thousands of acres of farming land were covered with water. The potato crops in some of the Southern States were injured. The fruit crop has been damaged in many places, and it is thought that if a season of extremely hot weather follows the crop will be entirely destroyed. No news of any accident to vessels was received at the ship news office yesterday.....The following telegram was received here on Saturday. Nashville, Tenn., June 10.—"Full advices from the peanut region of Tennessee confirm the reports of a comparative failure of the present crop. Many farmers have plowed up their land, and it is said that many others will be satisfied with a fifth of a crop." The day before this telegram was published the peanut dealers and brokers in this city received the following notice signed by a large peanut firm in Nashville: "We can state to you that the coming peanut crop will be a complete failure this season." These notices come, there's little doubt, from a syndicate who wish to make a fortune by "cornering" peanuts, the Tennessee crop having been bought by a few speculators who have it stored in Cincinnati.

Tell the Sick.

Thousands of lives are destroyed by diseases of the kidneys and liver. Kidney-Wort would save them. Tell the sick of it, and that it is for sale by all druggists in either dry or liquid form.—London Times.

I have used Higgin's English Salt and consider it superior to Ashton's. I ordered Higgin's Salt, but the Ashton's was sent me and I returned the Ashton's. O. M. RICHARDS.

Elmo, Wis., March. 9, 1881.

Women that have been pronounced incurable by the best physicians in the country, have been completely cured of female weakness, by the use of Lydia E. Pinkham's Vegetable Compound. Send to Mrs. Lydia E. Pinkham 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

When the brain is wearied, the nerves unstrung, the muscles weak, use Hop Bitters.

BURNETT'S COCOAINE

Has Received Universal Endorsement.

No other preparation possesses such remarkable properties for embellishing and strengthening the hair and rendering it dark and glossy. It cures baldness and eradicates dandruff.

Burnett's Flavoring Extracts are the best.

The Markets.

BUTTER—Only a small local inquiry for choice creamery and fine dairy, and market quiet and rather weak. Offerings liberal; creamery at 19@20c. for choice to fancy; good do., 17@18c.; dairy at 13@16c. for fair to choice and fancy in a small way at 17c.; white and streaked, 8@9c.; grease stock, 6@7c. per pound; fresh-made, ladle-packed, 12@13. HOGS—Demand good; market active but steady; poor to good mixed packing, $5 55@5 85; light, $5 80@9 95; choice heavy, $5 90@6.20; culls and light Yorkers, $4 50@5.50. CATTLE—Market active and very strong; exports, $6@6.30; good to choice shipping, $5.75@5.90; common to fair, $5.25@5.65; distillery-fed, $5.50@6.10; far West corn-fed, $5.60@6; Northern wintered Texans, $4.50@5 50; through grass Texans, 3 25@4 40; native butchers active but steady at $2.50@5; stockers and feeders strong, with a fair demand at $3.50@5. SHEEP—Market very weak; all sold; Texas shearlings, $3 65; common to medium, $4@4.50; choice, $4.60@4 80; lambs, ₩ head, $2@2.60.

Cincinnati.—WHEAT firm; No. 2 red Winter at $1.12@1.16. CORN strong; No. 2 mixed 46¼@47½c. OATS quiet but firm; No. 2 mixed 40c. RYE dull; No. 2 at $1.05 asked, $1.03¼ bid. PORK quiet at $16 26@16 50. Lard nominally unchanged. Bulk-meats firm; Bacon—shoulders $6 50; clear rib, $8 95; clear sides $9.35. HOGS steady; common and light, $4 25@5 85; packing and butchers', $5 30@6.15. BUTTER—Fancy creamery sells at 21@22c.; prime do. at 20c.; choice dairy at 15@16c; prime to choice Western Reserve at 14@15c.; prime to choice Central Ohio at 12@14c., and common do. at 10@11c. ₩ lb. CHEESE.—The receipts have been light, but the market has ruled somewhat easier, for good to prime factory at 7@8c. ₩ lb. At the close there is a light supply of prime stock and a firmer tone prevails, but inferior is dull and sells at 5@6c. EGGS.—The market has been stronger and prices have rapidly advanced under light receipts, with sales at 16@17c ₩ doz., but at the close the advance seems to have culminated and a decline is anticipated. NEW POTATOES.—The receipts are more liberal, but they consist largely of small size and stock in bad condition. Prime to choice sell at $4 50@5.50 ₩ bbl., but prices range down to $1 for inferior

St. Louis.—WHEAT No 2 Red Fall, $1 11½@1 11¾ cash and June; $1 10½@1 11½, July; $1 09¾@1 09¾ August; $1 09½@1 09 ⅞ September; $1 08⅝@1 08⅞ all the year; No 3 do, at $1 05¾; No 4 do $1 00½ bid. CORN 45c@45½c, cash; OATS 36c@36½c cash and June; Pork quiet; jobbing, $16 75. Lard firm at $10 55 asked. Bulk-meats in good demand and firm; Shoulders, $5 65; Clear Rib, $8 40; Clear Sides, $8 60; large sales of Winter Clear Rib for smoking on private terms. BUTTER.—Creamery 20@23c; dairy 16@18c—selections slightly more; prime 12@14c, common 7½@8c; Dear-by make (in pails) ranges from 7c for low to 10c for sweet yellow. HEMP.—Common undressed dull at $80@90; prime to choice in light supply—at $95 to $100; dressed $145@155; shorts $115 to $125; hackled tow $50 to 55. FLAXSEED scarce and wanted at $1 05 here and $1 06 in East St. Louis, pure test. Castor Beans prime in car lots ready sale at $1 40. Hemp Seed quiet at 95c@$1 for clean. Hogs fairly active; Yorkers, $5 60@5 65; mixed packing, $5 30@5 75; choice to fancy, $5 80@6; Cattle market active and firm; prices 10c@15c. higher on some; exporters, $5 65@6 10; heavy shipping Steers, $5@5 60; light do., $4 50@5; butchers' Steers $4 20@4 90 feeding Steers $4 80@5 15; stockers' Cows and Heifers, $3 25@4 25; grass Texans, $3 20@4 25. Sheep market firm; demand exceeds supply; fair to choice $3 25@4 50.

There are more cures made with Hop Bitters than all other medicines.—*Adv.*

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, June 11, 1881.

BEANS AND PEAS.—There has been no wholesale demand for beans and quotations are all the market will bear, even for moderate use. Fancy beans are almost nominal. Green peas dull at $1.50@1 55 for Wis. Southern B. E. peas in light call at $3.25 per 2-bush bag.

Marrow beans, prime, $2.47@2.50; other, $2.30@2.40; medium, prime, $2.42½@2.47½; other, $2.20@2.35; pea, $2.25@2.50, white kidney, $2.30@2.50; red kidney, prime, $1.57½@1.62½; fair to good, $1.40@1.45; black or turtle soup, $1.40@1.45.

Receipts for week, 2,413 bush.

Exports do. 269 pkgs.

About 4,000 bush. California beans are on the way.

BUTTER.—Prices have held their own during the week and at the close there is a good steady tone for prime table qualities. Western arrives freely but State still leads the trade especially in creamery goods. All butter now shows good pasture color and any white or fodder-fed remnants that have not been worked off will have to be marked cheaply. In this way common Western will suffer the most. The loyal butter dealers are much displeased with the governor's veto of the oleomargarine bills. If the fears of good students of this subject of pure butter and substitutes should be realized it certainly looks as if interior business will be seriously disturbed on the price point. Even Western dealers who now have the swing of the low priced trade fear the competition of imitations.

Creamery—Western, good to prime, 20@21c.; State and Penn. 20@22c.; poor, 18@19c.; sweet cream, 19@20c.; State pails and half tubs, choice, 20@21c.; fair to prime, 18@19c.; Welsh tubs, 18@19½c; poor State, 14@17c.; firkins yellow, 19@22c; Western imitation, 16@18c.; dairy, fine, 16@18c.; other, 14@15c.; factory or ladle-packed, best, 15@16c.; other, 10@14c.; very poor Western, 9c.

Receipts for week, 24,800 pkgs.; exports, 8 895 do.

CHEESE.—Easy prices have ruled the entire week and shippers have cleared the market of most of the upper grades of State. The pretty large remnant of low grades is hard to move. Buyers would rather take best at highest present price than risk the slow sale of inferior goods. Export business for the month ending June 1st compares well with last year. Western cheese is not of attractive quality and few make the extremes.

State factory, fine, 9¼c., fair to prime, 8@9c; poor to fair, 7@8c.; Ohios, fine, 8¼@8¾c.; other 7½@8c; part skimmed, 3½@4½c.; full skims, 2@3c.; Wisconsin poor to fine factory 7@8½c.

Receipts for week, 3 814 boxes.

Exports for week, 77,993 boxes.

Liverpool cable, 50s.

Steam to Liverpool, 20@25s.

COTTON.—The market has indicated considerable vigor without any very notable heavy dealings.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

The close of the market for futures was officially reported as follows: June, 11.07@11.09c.; July, 11.10@11.11c.; August, 11.18@11.19c.; September, 10.74@10.75c.; October, 10.32@10.33c.; November, 10.20c.; December, 10.20c.; January, 10.32@10.33c.; February, 10 44@10.45c.; March, 10 57@10.59c.

Receipts for the week 13,158 bales.

Exports do. 11,416 do.

DRIED FRUITS.—There is more disposition to sell apples than before. Quotations for evaporated are extreme and other process are weak, with a few foreign shippers bidding a fraction under last week. Peaches are quiet and we see very few of any sort offering. There has been some trade in cherries, though not at the closing prices. Blackberries firmer. Other sorts have a fair trade for the season.

Apples evaporated choice 8¾@9c; fair to prime 7¾@8¼c; North Carolina sliced, common to best 4@5c. Va, do. 3¾@4¼c; Tenn in bbls. 4@4½c. do. bags 3¾@4c; State fine cut 4@4½c., quarters 4¾@4¾c; Western, 4@4¼c; evaporated peaches peeled 27@30c.; unpeeled 13@14c; sun-dried peeled 17@22c; unpeeled 5@5¾c. Plums 11@12c. Blackberries 8c. Cherries 13@14c. Raspberries 23@24c. Whortleberries 11½c.

Receipts for the week, all kinds, 2,245 pkgs.

Exports dried apples, 400 pkgs.

EGGS.—Receipts for week, 10 850 bbls.; do. last week 11,900 do. Prices have ruled steady and in buyer's favor during the week under moderate receipts. At the close the feeling is weaker as a good many cold storage parcels are appearing. These sell ½c. under fresh. Sales are mainly at average loss.

Near points, 21c.: State and Pa., 19½@20c.; Western

and Canada, 19@19½c.; Md. and W. Va. 19c.; poor lots, 18@18½c.

FLOUR—Has sympathized with a strong wheat movement and has been good, drawing freely upon the upper brands, both for export and home use. The latter call is unusually steady, as prices are down to a point that admits very free consumption.

No. 2 ₱ bbl., $3.00@3.50; State and Western superfine, $4.@4.50; city mills extra, $6@6.25; Spring wheat do. $4.60@5.00; Spring XX and XXX, $5.25@6.10; patents, $6.50@8; Ohio extra hoop shipping $4.75@5.25; trade brands $5.25@6.25; Southern, home extra, $4.85@5.25; do. double extra, $5.50@6.00; do. family, $6.25@7; Southern shipping $5.25@5.85; do. XX and family, $6@7.00. Rye, $5.40@5.85. Corn-meal, Brandywine, $3.25@3.40; Western, $2.90@3.20.

Receipts of flour for week, 29,300 bbls.; do. corn-meal, 1,173 bbls.

Exports of flour, 57,171 bbls.; do. corn-meal, 3,150 bbls.

FRESH FRUITS.—It has been a rough week for berries. Quotations of yesterday were the first that had any paying round for the whole week. At one time the market was so poor here that large lots were sent direct to Boston and other Eastern points. Southern berries have not paid picking and freight.

Up river prime, ₱ quart, 10@12c.; do. thirds, 3@4c.; upper N. J., ₱ quart, 8@10c.; do. ₱ pint, 3½@5c.; Southern N. J. ₱ qt. 4@8c.; Md. and Del., 4@8c.; small hulled baskets, ₱ 100, $2@2.50. Gooseberries, $1.50; cherries, 10@12c.; prime other, 3@7c. It is feared the rain has hurt a great many near-by early trees. Some splendid Georgia peaches are in; quoted at $2.50@3 ₱ 8 bush box. Hot-house grapes, Black Hamburgs, $1@1.50 per lb. Peanuts dull with unfavorable weather; Va. hand-picked, 4½@4¾c. ₱ lb.; fancy, 4@4¼c; extra prime, 3¾@3¾c.; good to prime, 3@3½c.; shelled, 2¾@3c.; pecan nuts, 10c.

GRAIN.—Crop reports of wheat have been unfavorable and prices have ruled higher. There seems to be, however, some good solid foreign wants, and exporters have dealt freely, notwithstanding the enhanced values of some parts of the week.

Corn has sold well speculatively, and the exportation for the week is remarkably close to wheat.

Oats have had an unsettled week, but close with a steadier feeling.

Rye quoted in small sales.

Canadian peas 81½@85c to arrive.

Wheat, Spring $1.05@1.25; do No. 2 $1.18@1.20; do. No. 3, $1.12@1.14; red Winter No. 2, $1.05@1.25; red Winter $1.16@1.31; white Western and State $1.17@1.26. Rye, $1.03@1.11. Oats, white No. 1, 52½@53c.; white No. 2 48½@49½c.; white No. 3 47@47½c; mixed No 1 48c; do, No. 2 47½c.; do No. 3 46@47c. Corn, Western mixed 47@55c.; do. No. 2 55@56½c.; do. white 60@64c; Southern do, 63@65c.

Receipts for week, wheat, bush., 1,499,300; corn, do. 1,046,675; oats do. 199,350; rye, do. 3,223; malt, do. 96 250; rice pkgs. 700.

Exports for week, wheat, bush 922,975; corn, do. 770,327; oats, do. 3 500; rice, pkgs., 35.

HAY AND STRAW.—Exports of hay and straw for week 1,625 bales. Prices for hay show no recovery and are not likely to until better quality shows. There is quite an accumulation of low grades. Straw unchanged.

Choice retailing timothy hay 90@95c. ₱ 100 lbs.; second quality, 70@8 c. do.; shipping 65@65c. do.; clover mixed 50@75c.; do. pure 65@70c.; prairie hay, 65@70c. Long rye straw $1.0.@1.10 ₱ 100 lbs.; short do. 60@65c. do.; other grain, 45@50c. do.

HOPS.—Demand small for brewing or export. Supply under good control especially of fine brands of new.

N. Y. State crop of '80 good to prime 20@23c; fair to good 18@20c; low grade 13@15c; crop of '79 good to choice 16c; low to fair 12@15c; N. Y. State olds 12@17c; eastern crop of '80 low to choice 15@20c; Wisconsin do. 15@22c; Cal. do, good to choice 18@22c.

Exports for week, 429 bales.

Receipts for week, 47 bales.

MILK.—Cool weather has continued to check sales and considerable milk was returned to the country. The average for sales which occurred up to Tuesday was 88½c. ₱ can of 40 quarts. Prices paid to farmers for the month of May was 1½@3c ₱ quart.

POULTRY AND GAME.—As with many other things the dressed poultry market has been so nearly deserted during the week that a small supply proved a heavy one and prices are actually lower. City killers are operating quite steadily and that takes off some trade from other packed.

Dressed turkeys, choice ₱ lb 14@16c.; coarse 12@13c; scalded, 11@12c.; Phila. Spring chickens 35@45c; N. J. 30@35c; Phila. Winter 30c; fowls, Phila. d.-p. 15@; N. J. d.p. 13@14c.; do. scalded 12@13c. State and Western 10@12½c; do. d.p. 13@13½c. Ducks, Spring, 25@30c.; old 12@14c.; Squabs, white, ₱ doz. $2.50@2.75; do. dark, $1.25@1.50.

Live poultry—The market is dull; remote Southern poultry arrives in too thin a condition to sell well. Turkeys are a decided drug. It is thought the late severe rains will hurt the young broods of turkeys. Ducks are lower. Fine geese in demand.

Spring chickens prime ₱ lb 28@33c.; other 20@25c. Fowls, ₱ lb, 11@12c.; roosters, 5@6c.; turkeys, 9@11c.; ducks, ₱ pair 50@75c.; geese, extra $1.50; other 75c@$1.25 tame pigeons, 25@30c.

There is no market offering of wild pigeons; they would sell as other game is scarce. Wild pigeons, ₱ doz., $1.00@1 75; do squab, 75c.@$1; Eng. snipe, $2.25@2.50 plover, $3.25@2.37; sand snipe, 50c.; frog's hind legs, ₱ lb, 25@30c.

PROVISIONS.—The market for hog products has wavered several times during the week, but dealers in no item have exhibited a discouraged feeling, as the impression is that ultimate recoveries will compensate for recent declines.

Pork extra prime $14 ₱ bbl.; Western mess new $16.60@16.85; old $15 50@15.85. Lard—Western steam $11@11.05 per 100 lbs.; prime city $11.00. Hams smoked city 11½@11¾c; pickled Western 10½@10¾c; shoulders, smoked city 8¾@8¾c; pickled 7¾@7¾c. Bacon long clear 8¾c. Beef W. plain mess $9.50@10 extra mess, $11.50@13; family $12.50@13; India tes, $22@24; beef hams $23.50@24.50.

Receipts for week, beef, bbls. and tcs, 3 420 pork., bbls. 830; cut-meats, pkgs, 12,700; lard; do. 18,700.

Exports for week, beef, bbls. and tcs., 1,800. pork do. 1,900; cut-meats, lbs. 3,017,632; lard, do. 2,777,300.

TOBACCO.—There is trade enough to support former prices; most dealers call the market firm.

Incessant rains have restricted a good deal of trade, while they have also very unprofitably damaged large quantities of tender produce. Strawberries in this way have lost a valuable week of the season. Had it not been for the liberal Eastern trade the week might almost be counted a blank one for owners and growers.

VEGETABLES.—There is a fair useful demand for old potatoes but prices are not strong as the Summer is here and new crop will soon be a feature. New have declined; Norfolks run to small for ready sale.

Bermuda potatoes new, $7; Chas. and Sav., $4@5; Norfolk, $3.50@4.50; do. cults, $1@2; best old rose in double head, $2@2.50; do. peachblow and snowflake, $1.62@2.37; other sorts, $1.50@1.75. Few Southern items of garden truck have a steady sale, as N. J. and L. I. have begun to ship desirable sorts. Green peas, N. J. per bbl $2@2.25; Md., $1.50@2 Norfolk marrow fats 75c@$1; L. I. stand bag $1.50@1.75; N. C. string beans, ½ bbl $1.50@2.50; Southern cucumbers, $1@1.25; do. tomatoes, $1@1.25; Bermuda ₱ 6-qt. box, 50@60c.; cabbages, Norfolk, ₱ bbl. 75c.@$1; do. L. I. ₱ 100, $4; beets, do. 100 bchs. $3@4; Bermuda onions, ₱ crate, $1@1.12; lettuce, ₱ bbl 50c@$1; squash, N. C. ₱ crate, 75c.@$1; asparagus, Oyster Bay, per doz. $2@2.25; do. other $1.00@2; radishes, per 100 bchs 50c@$1; rhubarb do. $1; white turnips do. $1.50@3; cauliflower ₱ doz. $1@2.

WOOL—Supplies are going into active distribution and prices favor sellers. The Producers' Price Current says:—The chief interest in the market centers in the new Ohio wools, now about to be offered for sale. It is feared that the speculative excitement recently manifested in California and Texas may be repeated in Ohio and carry prices above a safe basis; the opinion is generally expressed that at 33@35c. the Ohio fleeces can be safely handled at a fair profit, but at higher rates business would be very hazardous.

LIVE STOCK MARKETS.

NEW YORK, Saturday, June 11 1881.

BEEVES.—Receipts for the week 13,461 head; do. last week 11,376 do. The week has realized the prospect warranted for it by last week's brisk trade, and the yards at both 60th Street and Jersey City are clear of stock. During the week nothing decent has gone under 9c.

MILCH COWS.—The offering is moderate, but the demand is limited; the range is unimproved; $30@55 per head for poor to prime quality.

VEAL CALVES.—Fair prices have ruled in a brisk market.

Prime N. J. fed, 6¼@7c.; do. state, 6@6½c.; poor to good yard lots, 5@5½c.; Mt. Holleys 6@7c.; buttermilks, 4¼@4½c; up-river dressed, 7½@10c. Our quotations include West Washington Market stock.

SHEEP AND LAMBS.—Receipts for the week 29,304 head; do. last week 22,778 do. Good sheep have had a quick sale, but poor bunches have dragged. A few very poor Texas quoted at $4.75 per 100 lbs.; but most of the sales were at 5@5¼c, medium to prime. Lambs, common Va. 6¾c; Western 8¾c; N. J. 9¾@10¾c.

SWINE.—Receipts for last week, 30,811 head. Choice corn-fed quoted 6c. forextreme; City dressed State, 7¾@8½c.; do. Western, 7¾c.

Steel Barb Wire.

GALVANIZED or PAINTED.

15 FEET TO THE POUND.

The use of Barbed Wire for Fencing is no longer an experiment, but an acknowledged necessity, as over *one hundred thousand miles* of it were put up last year, and we confidently expect twice the quantity will be used this year, there being no other material anywhere near as cheap, lasting, and effective.

CIRCULARS and SAMPLES by MAIL to any part of the World.

CANNOT BE INJURED BY FIRE, WIND, OR WATER,

IT DOES NOT INJURE CATTLE.

Estimating Wire at 12c. a lb. and Wood Posts at 10c. each, a Fence of Four Lines of Wire can be made for 60c. a Rod, or with Galvanized Iron Posts, a Perfect and Everlasting Fence for One Dollar a Rod.

Also Twisted Galvanized Wire without Barbs, 18 Feet to the Pound; Patent Iron Posts for Wire Fence, strong, light, and cheap; Wire Netting for Poultry Yards, Lawns, etc.; Wire Stretchers and Cutters.

Eureka Post Hole Digger.

AS SEEN IN THE ENGRAVING.

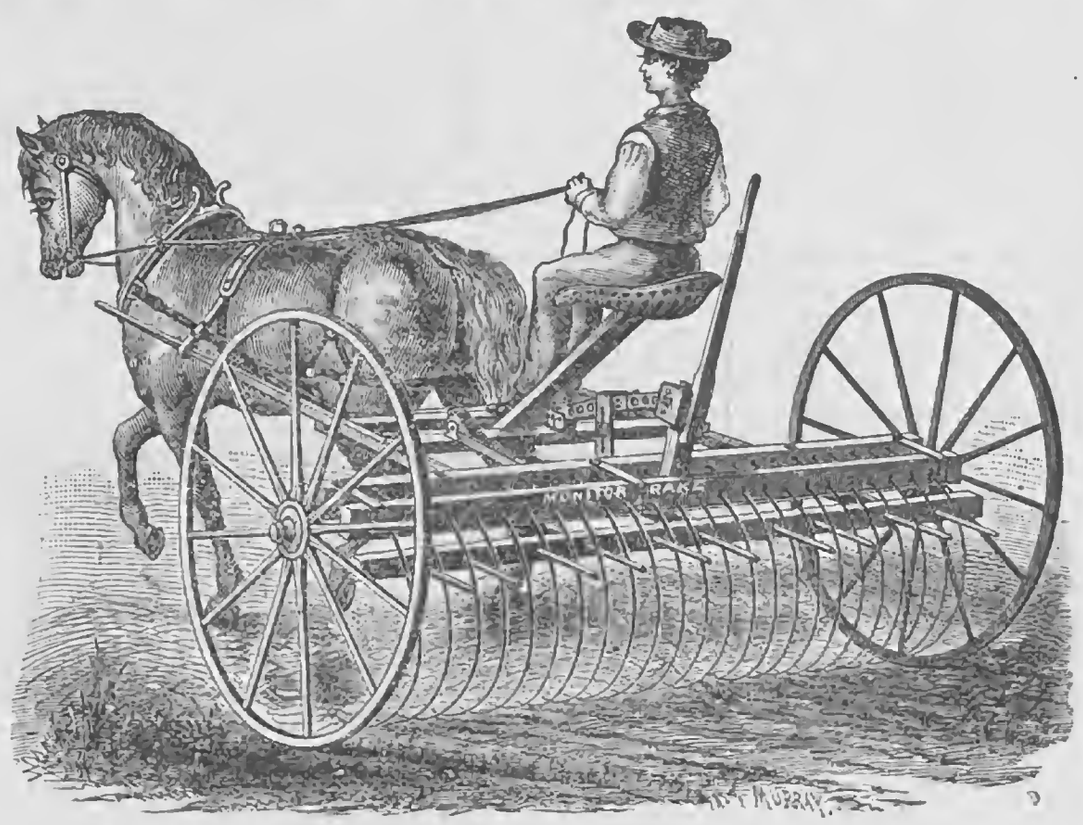
Work done five times Quicker and Easier than by the old way. No Clogging. No Knee Work. No Back Ache.

New Patent Door-Yard Fence,

made of "Round Steel Pickets," with Steel Posts and Frame. Light, handsome, and cheap. Shipped in pieces in boxes. Any one can put it up. Cheaper than wood, and half the price of other iron fences. Send for Illustrated Circulars to

GRANVILLE NICHOLSON, 71 John St., N.Y.

The Monitor Self-Dump Rake.



Of all the Rakes that I ever saw rake, I never saw a Rake rake as this Rake rakes! That is what they all say.

CONSUMERS

---OF---

TEA & COFFEE.

We have made a specialty during the past four years of GIVING AWAY as PREMIUMS, to those who get up CLUBS for our Teas, DINNER SETS, GOLD BAND TEA SETS, SILVER-PLATED WARE, and other articles both useful and ornamental.

We import and buy direct from manufacturers all the goods we handle, and own them at the *lowest possible price* cash will purchase. During the past four years we have sent from our store over 12,000 of these orders, and they have gone into almost every State in the Union.

We keep in stock *every variety* of Tea known, and at all prices.

Oolong, Japan, Mixed, English Breakfast, Old and Young Hyson, Imperial, 50c., 75c., very finest $1. Gunpowder, Black Japan, Foochow 75c., $1. Orange Pekoe and Assam, 85c and $1.

Below are a *few* of the many Premiums offered:

With a $5 order we send a *Silver-Plated Caster.*

With a $10 order we send an *English China Tea Set of 45 pieces.*

With a $15 order we send a *Silver-Plated Caster, Pickle Dish and Butter Dish* or an *English China Decorated Tea Set of 44 pieces.*

With a $20 order we send a *French China Gold Band Tea Set of 44 pieces*, or an *English China Dinner Set of 106 pieces.*

We have *hundreds* of letters like the following:

LIME ROCK, Conn., April 30th, 1881.

Gentlemen—Please accept thanks for the beautiful Tea Set, which is much nicer than I expected, and indeed it is surprising to every one how you can do so much for so little. All are so well satisfied with the Tea that I think you will receive another order soon.

Yours truly, MRS. A. THORPE.

TAUNTON, Mass., March 8, 1881.

Gentlemen—I have forwarded eight different orders for Tea, and have received as premiums a tea set, a silver-plated caster, a dinner set, a glass set, a case of silver-plated knives and forks, a pair of French china fruit dishes, and *two ladies' gold watches*, and am now on my ninth order. Both Tea and premiums I am well pleased with, and have found perfect satisfaction with both. Yours truly,

MRS. MARIA C. LYNCH.

Orders, with P. O. Order, or money enclosed in regis tered letter can be sent at our risk. All checks or Post Office orders should be made payable to F. M. LINNELL.

We also send Teas by mail, without premium, postage paid, at list prices, to those who wish for choice goods and are so situated they cannot obtain them at home. For full price and premium list, send us postal, with address PLAINLY WRITTEN.

Nutrition of Animals.

WHEN the food has been completely digested in the stomach and the upper portion of the bowels, it passes into the smaller intestines, where a part of it is taken up into the system and is converted into blood. The food, which has become a liquid substance, something like cream, is absorbed by a quantity of small, short tubes, much like short pieces of thread, hanging in the intestines These are known as *villi*. They convey the food into a system of veins or vessels called *lacteals*, which lead it through numerous small glands, where it is further changed, and finally convey it to a large vein, from which it pours into a large blood vessel in the chest and goes to the heart; the heart, by its pulsations, forces the newly-made blood to all portions of the body, where it is used to form flesh, bone, fat, and all the tissues of the body. A part of the food does not take this course, but enters the veins of the intestines through their walls, and mixes directly with the blood and goes with it to the liver. What happens to this part of the blood in the liver we do not fully know; doubtless part of it is changed into bile, which is formed in the liver and which is poured from it into the intestines to assist in the digestion of the food. The liver is the most important organ of the whole system of nutrition; it is very easily disturbed if anything is wrong with the food, and when it is out of order very serious diseases affect the animal.

The process of nutrition not only provides new blood, but it must convey into the system those substances which the blood requires for its formation, and neither less of these than the blood requires nor any more; otherwise in the one case the blood is not able to support life, and in the other it is made impure, and the animal becomes sick and diseased. Thus if an animal's food has too much of any one substance in it, the health suffers very soon. There are fifteen single substances which are needed to maintain an animal in good health. These are, oxygen, hydrogen, carbon, nitrogen, chlorine, sulphur, phosphorus, silicon, potassium, sodium, calcium (lime), magnesium, iron and manganese. Oxygen and hydrogen form water of which three-fourths of the body are composed; carbon forms one-half of the mass of dried flesh; nitrogen exists in the flesh, bones and hair; chlorine with sodium, in the form of common salt, is found in all the secretions; sulphur exists in the hair, wool, flesh, the saliva and the bile; phosphorus combined with lime forms nearly half the substance of the bones; it is also found in the brain and the nervous system; silicon exists in small quantity in the bones; potassium is contained in the blood, flesh and milk; magnesium is found in the bones and the blood; iron forms a necessary part of the blood and gives to it its color, and manganese is found in hair.

Now if any one of these substances is wanting in the food the whole system of nutrition fails; just as if we should take a link from a chain, or a stone from an arch these would fall. Every one is of absolute importance and this is a point to be considered in choosing the food of an animal; another point to be considered is that the food must be chosen so that there should not be too large a quantity of any of these substances in the food. For if there should be, food is wasted or the system is disordered and disease results. If an animal is fed on oil or sugar or corn there is too much carbon given; if on peas or beans, there is too much nitrogen: an excess of sulphur, phosphorus salt or potassium kills by poisoning; but in general if but a small excess is given of any of these substances it is carried off from the system with the undigested part of the food in the dung or urine, or is thrown off in the breath, or by the perspiration, or is stored up in the tissues in the form of fat or other products. This fact is turned to good account by farmers in feeding animals for making meat, or butter, or milk; or for making a supply of richer manure to fertilize the fields The whole subject of animal nutrition is one of the most wonderful with which we can make ourselves acquainted and well deserves a careful study, not only for its surpassing interest, but because much of the farmer's profit is closely connected with it.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK AND COUSINS.—I wish to join your Horticultural Club. Papa takes the RURAL NEW-YORKER and I am much interested in the Cousin's department. I was born, and lived in the city of Clinton, Ia., until last year, when Papa bought this farm and moved on it. We call it Fern Hill Farm. Papa has given me a small plot of ground and says I may plant what I please in it. I am ten years old, and go one mile to a school, which my sister teaches. I am as ever your niece. GRACE BLICK.

Prescott, Adams Co., Iowa.

DEAR UNCLE MARK:—I wrote you last Summer of the loss of our little boy, Wight (I suppose you did not receive the letter). He was thrown from a running horse, struck his head against a rock, causing concussion of the brain. He always read the Cousins' letters with great interest, and was very proud of being a member of your club. The seed you sent this Spring we have planted and will take great care of for his sake, and feel thankful to you for remembering him. Yours,

MRS. BINGHAM.

Miscellaneous.

A GREAT AMERICAN MANUFACTURE.

FOUR years ago an English guest at a gentleman's residence in Newton, Mass., could not forget his hobby-horse. He pined in health for its exercise; he pined in spirit for its diversion and for its complete conveyance. He sought out one skilled in wheel-craft, and got a wheel made at a cost of $313. This English guest became his host's preceptor in August, 1877, and really founded the manufacture of the modern bicycle in the United States. He interested his host, Col. Albert A. Pope, not only in the machine but in the use of it and construction of it, and gave him such accounts of the then ten-year-old manufacture of it in England, that he conceived the idea of becoming the pioneer of a new industry. In 1878 Col. Pope visited England, and personally observed the styles and methods of manufacture and the development of the use of bicycles, and satisfied himself that the enterprise was one which might be ventured upon in America. Upon his return to America he formed the Pope Manufacturing Co., and induced the Weed Sewing Machine Co., of Hartford, Conn., to join the enterprise. A portion of their works was set apart for this business, and the constantly increased demand and sales of the bicycles soon induced them to enlarge their works, and to-day the Pope Manufacturing Co. stands second to no other manufactury in this country.

The "Columbia," a cut of which is here shown, was brought out in 1880, and has already become one of the most popular bicycles in use.

As before stated, the manufactory is located at Hartford, Conn., but their principal offices are in Boston, Mass., where they occupy an elegant building at 597 and 599 Washington Street, two entire stories being fitted up expressly for their use

The company have local agencies in over 200 cities and towns of this country, and during the past three years they have made and sold thousands of bicycles to the different classes of professional and business men. Doctors, merchants, students, professors, and in fact all who have used them seem to agree in pronouncing them one of the most effectual and exhilarating means of exercise now in use. G. B. B.

"STANDARD COLUMAIA" BICYCLE.—FIG. 309.

[New York Spirit of the Times.]

Equine Inquiries.

A WORD FOR THE HORSE.

The "Cracks" of the Queen City.

[Cincinnati Correspondence.]

Our sporting fraternity throughout the whole country, as all know, have their semi-annual meetings on the turf. Whether they meet along the rock-bound coast of New England, and tread a track so close beside the snowy beach that the music of the hoof-tread commingles with the music of the surf, or whether they transport themselves to Kentucky's pleasant hills and valleys, 'tis the same. The horse will be their theme. And "the horse" will be at all times and places a fitting subject to discuss. The man who loves his horse loves his friend, and *vice versa*.

Whenever we meet with a man who will bestow proper kindness, food and care upon his horse, there we have found a man who, in time of need, will be true to his fellow-man, and consequently a true man. The laws of association, strong in man, are likewise strong in the horse. And the latter full well knows the hand that smites it harshly or the one that strokes it lightly, and tends to its sores and bruises. A curious instance of sagacity in the horse occurred recently in the stables of Mr. A. Toughman, situated on North Elm Street. Mr. T. has for a long time been in the habit of using St. Jacobs Oil, the Great German Remedy, in his extensive stables. Among Mr. T.'s many horses is a great, powerful Canadian draught horse. This animal in course of time got so that he knew the St. Jacobs Oil bottle very well. So well, in fact, that one day recently, on Mr. T.'s return from business, upon entering the stable he caught him licking the sore shoulder of a beast who stood beside him; the animal, giving a wise survey to his licking work, turned his head, caught up in his teeth from the box used as its receptacle a bottle of St. Jacobs Oil. He threw the bottle on the floor with violence enough to break it, and then deliberately licked up the St. Jacobs Oil and applied it to the cut. Readers, we have seen the laws of association belied by beings with less sense than Toughman's horse. The word has passed among us, and when we see a man who won't try the Oil we say, "He's worse than Toughman's horse."

How many thousands there are beside Mr. T. and his horse who do use St. Jacobs Oil! There is, for instance, B. Meartz, in Cincinnati, on Plum Street, just opposite the City Buildings, who always keeps a supply of the best horses and—St. Jacobs Oil in case of necessity. That gentleman says it is the best remedy ever used in a stable. He told us this in a conversational way recently, and the gentleman's word is away above doubt.

In Cincinnati, living at No. 16 Woodward Street, may be found Mr. Michael Kelly, boss drayman. This gentleman, in reply to our inquiry as to whether he used St. Jacobs Oil, said:

"I would not try to do without St. Jacobs Oil. I could not do it. Draught horses, like livery horses, receive so many bruises, cuts, sores, &c., that, in my opinion, no sensible man will try to do without St. Jacobs Oil. Say for me that I have used it a great many times, and have always found it the very best remedy in use for horses. By the way I have used the Oil in my family on several occasions, and had I the time to-day, I would like to tell you of its effects. You know my train-time is up; but be sure and call on me again some day."

Telling that courteous gentleman that in future we would be pleased to call on him we bade him good-day and turned our own horses—which by the way, know the good of St. Jacobs Oil—toward the Reading road, thence to Montgomery pike, to the palatial home and stables of Capt. George K. Howell. After a friendly chat, a sumptuous dinner and a fine drive, the Captain laid himself out for horse-talk. Said the Captain:

"Little Elk, the four-year-old mare which you saw in my stall, is my favorite. I regard her as a wonderful resurrection. About a year ago, and just after my mare had made her 2.19¾ record, she took a very aggravated case of rheumatism, either coming down the Sound or going up the Hudson river. She had more red flannel around her legs than would have made shirts for all the colored boys handling her. I had given up all hopes. I never expected to see her on the turf again. One day a celebrated Irish trainer and driver looked at my mare. 'Cap,' said he, 'why do you not cure your mare? She has got the rheumatism.' 'Can you cure her?' I asked. 'I will cure her in a week if you will let me have my way,' he replied. I told him to take her in hand, I knew she could not be worse; I never expected to see her better." The Captain paused a long while, and the changed expression on his countenance would make St. Jacob smile, as, rising to his feet, the Captain said: "Why, hang me if my mare was not driven in three days, and all through St. Jacobs Oil, the Great German Remedy. St. Jacobs Oil, my friend, brought about a resurrection." "Then, Captain," said I, "truthfully and fairly, St. Jacobs Oil is the wonder, is it not?" "You are right," said the Captain

Being in the neighborhood of Chester Park, Cincinnati's beautiful driving grounds, upon which have appeared most, if not all of the great horses of the day, it occurred to me, knowing that preparations were being made for the coming Spring trot, to enter. We did so; and were soon in conversation with the justly celebrated William W. Bair, the best known horseman in the United States, a gentleman who brought out "Maud S," owned by William H. Vanderbilt; "Katie Middleton," owned by R. C. Pate; "St. Julian," and several more of the very best horses in the country. Said we to Mr. Bair: "In the management of horses, Mr. Bair, must not a trainer possess veterinary knowledge, and know what to prescribe for their ailments?" Mr. Bair replied: "The horse has had in the past as varied forms of treatment as man. Now, when the horse is afflicted with such ailments as stiffness, bruises, cuts, etc., there is but *one* article that should be used, and that is St. Jacob's Oil, the Great German Remedy. I know all about horses, have applied several remedies, and can say without fear of contradiction, that St. Jacobs Oil is the *only* remedy to be relied on." Mr. Bair being very busy, the scribe bade that courteous gentleman adieu, and drove away.

Having regained the city we drove up Court Street, and reined up at the well-known fruit store of Mr. William Carroll, a gentleman who handles great quantities of imported and domestic fruits of all kinds, and of the best quality; stopping to make some purchases from Mr. Carroll's tempting stock, that gentleman, throwing the eye of a connoisseur on the horses, immediately fell to "talking horse." After praising our team, which we flatter ourselves is a pretty good one, thanks to St. Jacob, he, with the honest pride of proprietorship, invited us back to inspect his stables. Of course we could not refuse, and indeed it was a treat to enter so neatly kept and commodious a *hotel du cheval*. Mr. Carroll, in a manner which showed that gentleman's familiarity with the subject, showed us "the points" of his stock. "Mr. Carroll," asked the writer, "have you ever had occasion to doctor horses?" Said that gentleman: "My dear sir, although you now see before you some fine horses, from the horse which is driven in my delivery wagon to the stud driven by my son, and which by the way is a 2:30 roadster, yet I have had an immense amount of trouble with them; what from rheumatism to the simplest form of cut or bruise, there is not an ailment which I believe they have not had—ringbone, spavin; why, in fact, I really believe, everything they could have. I spent hundreds of dollars in veterinary surgeons' bills, which was money thrown away. There is a remedy, though, upon which I hit by mere chance, but upon which I will wager forever.

It is St. Jacobs Oil, the Great German Remedy—the greatest remedy in the world. It cured my horses every time it was applied. "Here," said the gentleman, "is where I keep St. Jacob; you see I guard him jealously." Mr. Carroll hereupon opened for my inspection a closet, and arranged along the shelf the writer saw several bottles of St. Jacobs Oil. Said we, examining one of the bottles: "Do you find it an expensive remedy, Mr. Carroll?" "Expensive?" exclaimed he. "Why, had I known of it two years ago, it would have saved me hundreds of dollars; it costs a mere nothing—fifty cents per bottle; and each bottle will do more good than $50 worth of their so-called surgery." With this we left the stable, and bidding Mr. Carroll good evening, we departed. Driving up Court street to John, we turned southward on John to our own stables. Just as we reached the corner of John and Eighth streets, we perceived our amiable and learned friend, Dr. P. F. Maley, about to seat himself behind his magnificent gray to take his usual evening drive. After exchanging the usual compliments with this distinguished physician, politician and scholar, we said:

"Doctor, that is a rather fine horse you drive."

"Oh, yes," replied that gentleman, "he is indeed fine. But he is just out of a severe attack of rheumatism now, and I must curb him for awhile. I, as a physician, ought scarcely to praise a proprietary medicine, and would not probably recommend their use among my patients; but I must say for that best known of all medicines, St. Jacobs Oil, the Great German Remedy, that it cured my horse, and consequently I must praise it." Here the Doctor laughed heartily, and, with a pleasant "Good evening," we parted.

We wish to say to those of our readers who do not know the Doctor—should there be any such, a fact which we very much doubt—that he is the Ex-Coroner of Hamilton county, which every Cincinnatian knows, and that he is a scholarly physician, which fact everybody should know Politically, the Doctor's reputation extends, we believe, as far as St. Jacobs Oil is known, and that is from Maine to California, from the Lakes to the Gulf.

After leaving the Doctor we had not far to go to reach our own stables, and putting away our horses, we asked ourselves, as we watched the groom handle them, whether we had derived the more pleasure from the ride or from the information. We unhesitatingly answered in favor of the information and good news we heard concerning St. Jacobs Oil.

CARPETS.

MOQUETTE CARPETS.—We have just placed on sale 300 pieces American Moquette Carpets at the low price of $1.40 per yard—the cheapest carpets ever offered. They cannot be had elsewhere in the city.

WILTON CARPETS at $2.25, full five-frame, and equal in quality to anything offered in this market at $2.75 or $3 per yard.

AXMINSTER and **MOQUETTE** Carpets from $1.50 to $2.50.

Best **BODY BRUSSELS** Carpets, $1.25, $1.40, $1.50 and $1.60—the latter for the choicest patterns.

TAPESTRY CARPETS.—Having exhausted our first offering of 75 cent Tapestry Carpets, we have placed on sale for a few days, another lot of the **SAME GOODS** at the **SAME LOW PRICE.** These goods are equal to those sold elsewhere at 90 cents and $1. We have other goods varying in price up to $1.15.

We have also on exhibition a superior **TAPESTRY CARPET**, equal in Texture and Quality to anything made either here or in Europe.

INGRAINS—We have of the best Extra Superior Grade a very full line from 75 cts. to 90 cts. per yard. Also, a line a grade lower at 65 cts. to 75 cts. —all wool.

Persons in want of **CARPETS** will do well to call on us before purchasing. Every Carpet is warranted as represented. Full satisfaction guaranteed or the money refunded.

PERSONAL ITEMS.

Mr. Fred D. Grant has arrived in Houston, Texas, and has begun work on his railroad.

Mrs. Garfield will spend the next few weeks at the Soldiers' Home, the President and her three oldest sons being with her.

Senator Ferry, of Michigan, is recovering from his sudden attack of illness, and it is believed that a few days' rest is all that is now needed for his complete restoration.

Nicholini, on whose account Adelina Patti left her husband, asks $2,000,000 for a singing tour through this country by himself and the *diva*, and on its refusal he threatens to undertake the venture on his own account.

General Francis A. Walker, Superintendent to the United States Census, has been chosen President of the Massachusetts Institute of Technology and will enter upon the performance of his duties in October.

Ex-Gov. Reid, of Rockingham, N. C., 68 years of age, is recovering from an attack of paralysis. He has been a member of Congress four years, Governor of the State four years, and Senator in Congress four years, besides having held other posts of trust and honor.

The Duke of Cambridge, British Commander-in-Chief, has a round mellow voice. He has fine limbs and very small feet, and dresses well. He eats only two meals a day. He rises early and works hard before breakfast, which he takes at noon. When once he sees a man he never forgets him. His life is methodical, and he is even tempered.

[Muscatine (Iowa,) Daily Journal.]

Messrs. J. R. Bennett & Co., Muskegon, Mich., thus speaks: St. Jacobs Oil is the best liniment around here. We sell more of it than of any other proprietary medicine we have in our store. Our customers are continually praising it effective qualities; and we think, that it is the best remedy for rheumatism, neuralgia, etc., we have ever had in stock.—*Adv.*

New Publications.

THE CYCLOPÆDIA WAR.

The month of July, 1881, witnesses the completion of the larges and most important literary work this country and the century have seen. It is the Library of Universal Knowledge, large type edition, in 15 large octavo volumes, containg 10 per cent. more matter than Appleton's Cyclopædia, at less than one fifth its cost, and 20 per cent. more than Johnson's Cyclopædia, at a little more than one fourth its cost.

Chambers's Encyclopædia, which forms the basis of the Library of Universal Knowledge (the last London edition of 1880 being reprinted verbatim as a portion of its contents), is the laborious product of the ripest British and European scholarship. It has developed through a century of Cyclopædia making, its various editions having been many times revised, in successive years, till it has come to be universally recognized, by those competent to judge, as standing at the very front of great aggregations of knowledge, and better adapted than any other Cyclopædia for popular use. It contains such full and important information as the ordinary reader, or the careful student, is likely to seek, upon about 2,500 subjects, in every department of human knowledge. Chambers's Encyclopædia, however, is a foreign production, edited and published for a foreign market, and could not be expected to give as much prominence to American topics as American readers might desire. To supply these and other deficiencies a large corps of American editors and writers have added important articles upon about 15,000 topics, covering the entire field of human knowledge, bringing the whole number of titles under one alphabetical arrangement to about 40,000. Thus the work is thoroughly Americanized, and the Library of Universal Knowledge becomes at once the latest and most complete Encyclopædia in the field, at a mere fraction of the cost of any similar work which has preceded it.

Victory

For The

Price

Revolution

Price of the 15 volumes, complete, in extra cloth binding, $15 00. In half Russia, sprinkled edges, $20 00. In half Russia, gilt top, $22 50. In full library sheep, marbled edges, $25.00.

The superlative value and importance of this great Encyclopædia lies especially in the fact that it is brought within the reach of every one who aspires after knowledge and culture. It is *really* a library of universal knowledge. It brings a liberal education easily within the reach even of every plowboy of the country and apprentice boy of the city. Every farmer and every mechanic in the land owes it to himself and to his children that such a Cyclopædia shall henceforward form a part of the outfit of his home. To the professional man, and every person of intelligence in every walk of life, a Cyclopædia is *a necessity*.

Of course the old and wealthy publishers who have grown rich (it is said that the Appletons have made a profit of nearly two million dollars on their Cyclopædia) from the sale of their high-priced publications are not pleased that their monopolies are broken and their power overthrown. Of course the book agents and booksellers who have been used to getting from 40 to 60 per cent. commission for selling these high priced books are not so well pleased to sell the Library of Universal Knowledge on 15 per cent. commission, though those who are not short-sighted discover that their own interests, after all, are identical with the interests of *the people*, and their real profits, in the end, are increased, by the immense sales which result from meeting the people's wants. The majority of booksellers, however, are better pleased to *slander* than to *sell* this and our numerous other standard and incomparably low-priced publications. But the Literary Revolution has always looked to *the people*, in whose interest it is, for its patronage, and it has never looked in vain, as our more than one million volumes printed last year (this year being increased to probably more than two millions) abundantly prove. You can order the Cyclopædias directly from us, and by uniting with your neighbors and friends you can secure club rates as follows:

$10,000 Reward

To Club Agents.

A discount of 10 per cent. will be allowed to any one ordering at one time three or more sets of the Cyclopædia; and a discount of 15 per cent. will be allowed to any one ordering five or more sets at one time.

As a special inducement to our friends and patrons to go to work *promptly* and *vigorously*, each doing what he can for the dissemination of universal knowledge, we propose to distribute $10,000 in special premiums as follows, in addition to the regular discount to clubs:

$5,000 Reward to be distributed equally among the first 500 club agents who send us clubs of not less than five subscribers, after June 15th and before September 1st,
$5,000 Reward in addition to the first $5,000 to be distributed among the 100 club agents who, during the same time, send to us the *largest number of subscribers*, not less than twenty in number the amount to be distributed proportionately to the whole number of subscribers which each of the 100 club agents may send us.

The names of the subscribers must in every case be forwarded to us. The first $5,000 named will be distributed as specified as rapidly as the orders are received, and the remaining $5,000 will be distributed promptly on Sept. 1st. The names of the persons receiving these rewards will be printed, with the amounts received by each, and the list sent to all the club agents entering into competition for them. Subscribers must be *actual purchasers for individual use*, to entitle the club agent to the rewards under this offer, and not booksellers or agents who buy to sell again.

Persons desiring to raise clubs may send to us at once for sample volumes, if they desire, in the various styles of binding, paying us 75 cents for the volume in cloth, $1.00 for the volume in half Russia, sprinkled edges, and $1.25 for the volume in library sheep. Orders for the full sets will be filled by us with the utmost promptness, within our ability to manufacture, beginning not later than July 10th, orders being filled in the order of their receipt by us.

Specimen pages of the "Library of Universal Knowledge" will be sent free upon request. Descriptive catalogue of our large list of standard publications, with terms to clubs, and illustrated pamphlet describing book-making and type-setting by steam, will be sent upon application. Remit by bank draft, money order, registered letter, or by express. Fractions of $1.00 may be sent in postage-stamps.

BOLSTER SPRINGS FOR FARM WAGONS.
Made of Best Oil Tempered Steel
SOMETHING NEW!

They save largely from wear and tear in every part of the Wagon. They remove all necessity for a Spring Seat. They convert a common Lumber Wagon into a Spring Wagon, making it equally comfortable for from one to twenty persons. They are admirably adapted to the wants of Fruit and Vegetable Growers. They are suited to all makes and sizes of Farm Wagons, and can be attached by any one. They make the cheapest and easiest riding Spring Wagon in the market. These Springs have been in practical use for over three years, and are a pronounced success. No Teamster or Farmer can afford to be without them.
We want Agents everywhere. Send for description and prices, and mention this paper.

TRADE KIDNEY-WORT MARK

THE ONLY MEDICINE

IN EITHER LIQUID OR DRY FORM

That Acts at the same time on

THE LIVER, THE BOWELS, AND THE KIDNEYS.

WHY ARE WE SICK?

Because we allow these great organs to become clogged or torpid, and poisonous humors are therefore forced into the blood that should be expelled naturally.

KIDNEY-WORT

WILL SURELY CURE

KIDNEY DISEASES,

LIVER COMPLAINTS,

PILES, CONSTIPATION, URINARY DISEASES, FEMALE WEAKNESSES, AND NERVOUS DISORDERS,

by causing free action of these organs and restoring their power to throw off disease.

Why suffer Bilious pains and aches?
Why tormented with Piles, Constipation?
Why frightened over disordered Kidneys?
Why endure nervous or sick headaches?

Use KIDNEY-WORT *and rejoice in health.*

It is put up in **Dry Vegetable Form**, in tin cans one package of which makes six quarts of medicine. Also in **Liquid Form, very Concentrated**, for those that cannot readily prepare it.

☞ It acts with equal efficiency in either form.

GET IT OF YOUR DRUGGIST. PRICE, $1.00

THE ADVANTAGES OF MODERN EDUCATION.

Grandmother.—"Why did you come out to see me on a cold day like this without your jacket, Nellie?"

Nellie.—"Cos there's a tear in it."

Grandmother.—"Then you ought to have mended it at once. When I was a girl we used to say, 'A stitch in time saves nine.' Do you understand what I mean?"

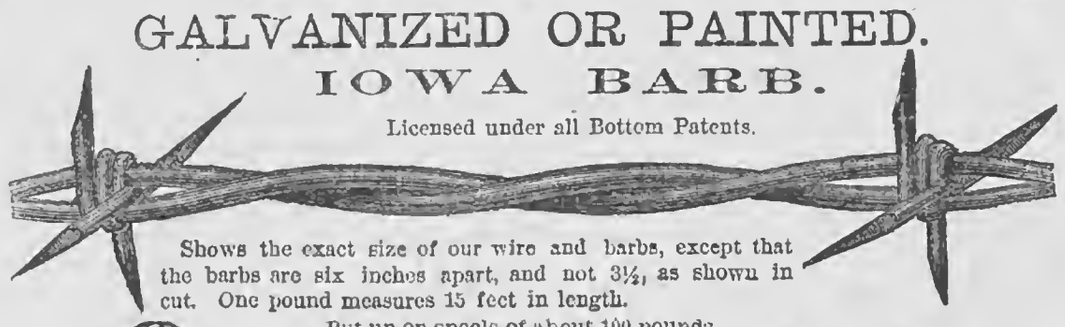
Nellie.—"Yes Grandma, of course I do. The first impression of a needle upon a small rent obviates a nine-fold introduction."—*Punch.*

Steel Barb Wire Fencing.

GALVANIZED OR PAINTED.

IOWA BARB.

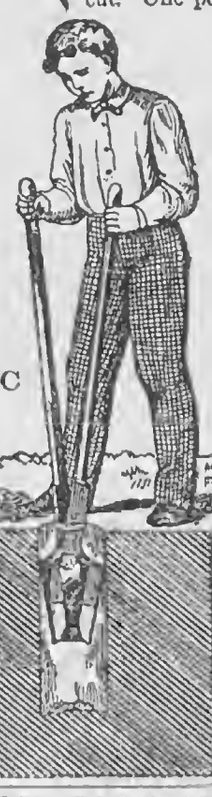
Licensed under all Bottom Patents.



Shows the exact size of our wire and barbs, except that the barbs are six inches apart, and not 3½, as shown in cut. One pound measures 15 feet in length.

Put up on spools of about 100 pounds.

The use of Barbed Wire for Fencing is no longer an experiment, but an acknowleged necessity, as over *one hundred thousand miles* of it were put up last year, and we confidently expect twice the quantity will be used this year, there being no other material anywhere near as cheap, lasting, or effective.



CANNOT BE INJURED BY FIRE, WIND OR WATER, AND WILL LAST A CENTURY.

IT DOES NOT INJURE CATTLE.

Estimating Wire at 12c. a lb. and Wood Posts at 10c. each, a Fence of Four Lines of Wire can be made for 60c. a rod, or with Galvanized Iron Posts, a Perfect and Everlasting Fence for One Dollar a Rod.

Ask your Merchant for our Wire, or write to us direct.

We also manufacture STAPLES, POST-HOLE DIGGERS, WIRE STRETCHERS and CUTTERS, IRON POSTS, etc.

Circulars and Samples by Mail to any Part of the World.

THE CELEBRATED

EUREKA POST HOLE DIGGER.

Work done five times Quicker and Easier than by the old way. No Clogging. No Knee Work. No Back Ache. Price $3 50, delivered to any part of the United States.

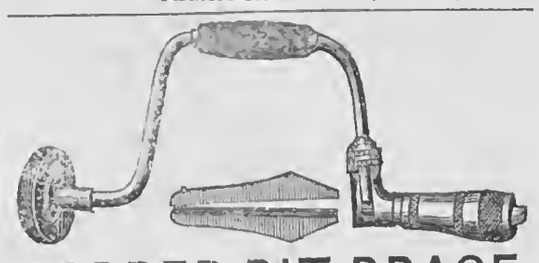
JAMES HARTNESS, Detroit, Mich.



BARBER BIT BRACE.

Hereafter every Bit Brace found in any market with Jaws as shown in the above cut, and bearing our name, will be made of Rolled Steel and heavily Nickel Plated. The Head is of Lignumvitæ, and the revolving Hand piece of Rosewood. The Jaws are of forged and tempered Steel, and will adapt themselves to any shape tool tang, round, square or flat, and hold it perfectly without any fitting. When made with a Ratchet Attachment it will bore in places where there is not room to revolve the Sweep; a slight back and forth motion driving the bit in or out. We formerly used Iron Jaws, which wore out. All such we will now replace with Steel, sending them by mail prepaid on receipt of 25 cents. They are all one size and will fit any Brace which we ever made. Our Braces are for sale by nearly all Hardware Dealers. Those who do not have them in stock will furnish them if requested. Price from $1.75 to $3.25 each. Many Braces are sold for less money; but this is the only Steel Brace in market; and one of them is worth six of any other kind. Save this notice as it may not appear again.

COLUMBIA BICYCLE.

Bicycle riding is an accomplishment easily acquired, and is rapidly becoming the most popular of out-door sports; as a health restorative it is invaluable, bringing into action every muscle of the body, strengthening the lungs, and invigorating the wearied brain. The practicability of the machine is generally conceded throughout the country, and the thousands of bicycles in daily use are constantly increasing in number. Send 3c. stamp for catalogue, with price list and full information. THE POPE M'F'G CO.

597 Washington Street, Boston, Mass.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XL.—No. 1639.} NEW YORK, JUNE 25, 1881. {PRICE FIVE CENTS $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

The Harvest Prospects.

WHEAT.

A smaller acreage than last year, and a much less favorable outlook. A probable decrease of at least 20 per cent., or about 100,000,000 bushels. Causes of decrease — Early Winter, Late Spring, May Drought, Excessive June rains, and Insect pests.

Heaviest Decrease in Winter Wheat.

Michigan, Indiana and Illinois the greatest sufferers. Fultz the leading American Wheat.

OATS.

Increase of acreage. Probably the largest aggregate oat crop yet produced.

RYE AND BARLEY.

About the usual acreage. Fair crops.

CORN.

An increased acreage, but a much poorer stand. Seed generally damaged everywhere. Much replanting. A probable decrease of 15 per cent., or about 229,000,000 bushels from last year's crop.

POTATOES.

An average crop in stand and acreage. Beetles never more numerous.

GRASS.

An abundant crop in the North, and a Fair Crop elsewhere.

COTTON.

Two per cent. increase in acreage. A good stand. Labor satisfactory, except in Texas and Arkansas.

TOBACCO.

Acreage increased, as usual. Fair stand—Growing better.

Apples a fair crop for the "off" year. **Pears** a good crop. **Peaches** a comparative failure. Small crops in Delaware, Maryland and the Michigan Peach Belt. Small Fruits abudant.

All Crops from two to three weeks Late.

EASTERN STATES.

Maine.

CANAAN, Somerset Co.—The acreage of and outlook for wheat is about 10 per cent. better than last year—Lost Nation. Oats, barley and rye look fully up to the average, with the usual acreage—barley two-rowed. Orchards and small fruits never blossomed fuller than this season; but a severe frost on night of June 6, killed the buds and leaves on the grape-vines. The usual acreage of corn was planted, but the frost cut it off, and killed the bean, cucumber and squash vines. Grass is looking well and promises an early and large hay crop. Not so many potatoes planted as usual through fear of the beetle. S. H. G.

CUMBERLAND CENTER, Cumberland Co.—Owing to late rains, farmers in this section have not finished planting. Early-sown wheat is looking fine, mostly Lost Nation. Acreage about the same as last year. Oats and barley look well; not much rye sown; corn just planted; acreage about the same as last year; much sweet corn is planted for canning. Apple trees give promise of more fruit than we expected after the abundant yield of last year. The prospect for small fruits is fair. Grass is looking fine. A late frost killed early tomatoes, beans, squashes, etc. F. B. H.

SO. MOLUNCUS, Aroostook Co.—Acreage of wheat and oats larger than usual. But little corn and barley raised here. Hay splendid—a large crop. Orchards and small fruits look well. Heavy frosts lately, but no damage done. Lost Nation wheat is sown altogether. Potato bugs plentiful. M. J.

STARK, Somerset Co.—Wheat below average acreage and yield on account of late Spring, common red and Lost Nation; a few are trying the White Russian and like it much. Oats fully an average area and looking well. Not much barley or rye sown in this section. The corn crop is about two weeks late, but more is being planted than usual and farmers are taking more interest in getting large yields—102 bushels of shelled corn have been raised per acre. Apple and pear trees blossomed very full and the prospect is that the crop will exceed any for several years. Currants and small fruits in abundance. W. J. D.

Warren, Knox Co.—The acreage of wheat is less than last year, owing in part to the poor crop of 1880, but more to the wet Spring we had, which rendered much land unfit to work until late, and this is now sown to barley. The principal variety of wheat generally sown is the Lost Nation. Another kind called the Upham wheat, which originated in the adjoining town of Camden, has been in good demand for seed. It is a bearded variety, yields well and makes a superior quality of flour. Wheat came up better than last year and is looking fully as well. Oats are looking well, about the usual amount having been sown. A frost on the night of the 6th did much damage to corn, potatoes, beans, grape-vines, etc. The apple crop last year was large, but the crop this year must greatly exceed that of last. Pear trees seem to be full of young fruit. Grass, our main crop, is looking fine and promises a large hay crop. M. W.

New Hampshire.

DEERFIELD CENTER, Rockingham Co.—Farmers sow only a few acres each of small grains; but more seems to have been sown this year than last, especially of wheat. The outlook is medium. The corn stand is very good, except that it is a little low owing to cold weather. About one-seventh more was planted than last year. All orchard fruit, except apples, will be full crops. Apples set badly. Small fruits abundant. O. J. C.

EAST BARRINGTON, Strafford Co.—Wheat and oats are looking well. Barley, rye, etc., are but little raised. White Russian is the principal wheat. Corn is backward; acreage about the same as last year. This is the "odd" year for apples; but we shall have a fair crop. Raspberries and blackberries were not harmed last Winter. I am afraid small fruit will not be worth picking. Grass looks fine. W. B. S.

HANOVER, Grafton Co.—The acreage and outlook for small grain are very slightly above the average of several years. Lost Nation wheat, two-rowed barley and Excelsior oats are the leading kinds after some nameless common sorts. Corn has an average outlook this year, and an increasing acreage every year. Orchard and small fruits promise well, particularly apples for an "off" year. T. W. S.

NORTH EPPING, Rockingham Co.—There is very little grain sown in my neighborhood; what there is, is looking fine. More of oats and barley than of any other sort. Grain does not pay here, and it is sowed only to get a good catch of grass. About the same quantity of corn is planted as last year, and it is looking well. The weather is almost too cold for it, but it is good for grass. Good prospect for large yield of hay. About one-fourth of apple trees will bear fruit; more fancy varieties than shippers. There will be large crops of peaches, plums, strawberries, etc. G. Q. D.

REED'S FERRY, Hillsboro Co.—There is not enough wheat raised in this section to report. Not much barley. The acreage of rye is not more than one-fourth of an average. The corn crop is larger every year; two weeks late this year. Apples and pears are promising. No peaches. Small fruits are looking well. F. F. W.

Vermont.

BRANDON, Rutland Co.—Only a few acre fields of wheat for home consumption in this section. Owing to an unfavorable climate or soil it cannot be profitably raised here, although a liberal premium and extra care produced, in an exceptionally favorable locality, a yield of 42 bushels per acre—Clawson. Oats and corn are the principal cereals grown and a larger acreage of these has been planted than last year. Oats look splendid; White Swede is the favorite sort. Corn was slightly nipped by frost, but is recovering; flint varieties are exclusively planted. Potatoes are our principal export crop, of which a large quantity has been planted. Early Rose and Snowflake are the leading varieties, although all the kinds known to fame and seedsmen's catalogues find a place. Bugs are plentiful. The leaves of the earlier planted were turned by the frost, but as hoeing is being vigorously pushed they will doubtless regain their former luxuriance in a few days. The meadows do not promise as good a hay crop as we could wish; the grass started nicely in the Spring, but lately large patches have made their appearance which are entirely destitute of vegetation: the grass and even the weeds have died. In other patches varying in size from an ant-hill to one or two acres, the vegetation is short and of a pale, sickly look—quite undecided whether to live or die apparently. Various reasons are given; but no remedy has been discovered; the result must materially lessen the crop. SUBSCRIBER.

CORNWALL, Addison Co.—Had a dry Spring. Acreage of wheat is larger than usual, and the crop one-third better than last year—chiefly Clawson. Acreage of oats one-fourth more than usual and crop looks well. Not much barley or rye. Twice as much corn as usual, but it is badly injured by grubs. Many farmers have plowed it up and seeded the land to barley. Orchards blossomed well. Prospect good for an average yield. Small fruits good except cherries. The hay crop will be badly injured by grubs or worms at the roots. W. M. E.

FACTORY POINT, Bennington Co.—The acreage of wheat is small; we cannot raise it here. Oats are the principal crop sown. Barley and rye have a small acreage. Corn looks good; but it is about ten days late. The acreage is about the same as in 1880. Last year was our fruit year, but apple trees blossomed out well. Pear and plum trees will bear fair crops. Small fruits are not grown here to any extent. G. M. T.

SHELBURNE, Chittenden Co.—Acreage of grain of all kinds in this section is larger than usual. Outlook is good. Prospect for corn is good, though the acreage is smaller than last year. Outlook for orchard fruits is very good, but the small apples drop off considerably. Small fruits are but little grown. W. H. R.

VERNON, Windham Co.—But little wheat or barley sown in this section. A full average acreage of oats has been sown, and they look well. Rye very fair. The cold, wet weather in May delayed the planting of corn; some farmers have just finished, while others are hoeing the first time; the acreage, I think, is about the same as last year's. The show of apple blossoms was very good for the "off" year. The prospect for small fruits is good. The constant rains give us plenty of feed, and insure a good crop of hay. Farmers are happy, or ought to be. J. E. A.

Massachusetts.

BARRE, Worcester Co.—Very little wheat sown in this vicinity. Oats are grown chiefly for fodder. Rye and barley are raised only to a limited extent. Grain looks well when sown early, but continued rains have prevented many from sowing. Two-rowed barley mostly sown. The acreage of corn has been on the increase for several years. The wet season has prevented many from planting. Corn planted before the great rains looks good. Grass is our principal crop. J. H. G.

BELCHERTON, Hampshire Co.—But little wheat and less barley is raised in this section. Rye is very forward and fine. Corn looks well, with about the same acreage as last year. Potatoes look well, and as for potato bugs they are more abundant than ever before and apparently healthier. We have learned to handle them by means of Paris-green. Grass is more forward than for many years and a large hay crop is prophesied. For an "off" year apple trees blossomed remarkably full, and give promise of at least enough fruit for home use. Pears will be a heavy crop. A. B. H.

BLACKSTONE, Worcester Co.—No wheat in this section of the country. Oats are mostly raised to be cut green for fodder and ensilage. No barley. Rye is sown mostly. The prospect for corn is not very good, the season has been so rainy and cold that the field corn was not all planted by the first of June. The acreage is about the same as last year. Most of the farmers plant enough to carry them through the Winter with their stock and for home use. Apple trees blossomed full, but we don't expect much fruit as this is the "off" year. Raspberries and Blackberries were winter-killed. Some pears look well. Black knot or wart has about killed the cherries. O.

FRAMINGHAM, Middlesex Co.—Not much oats or barley sown in this country. Rye looks well. Corn is small, but a good stand; more planted than usual. Fruit trees look well; but this is the "odd" year for apples. Not much small fruit grown here. H. W. H.

PALMER, Hampden Co.—Little or no wheat is grown here. Rye is looking well. Corn oats and potatoes are quite backward owing to cold and wet weather. The acreage of each is nearly the same as last year. Grass never looked better. There is no prospect of any apples or peaches of any amount, it being the "off" year for the first; and a very severe Winter killed many of the last. H. D. F.

West Newton, Middlesex Co.—About the same acreage is devoted to the cereals as last year. Corn is uncommonly backward for the season; the cold weather and the unusual amount of rain are the causes. The hay crop is assured and must be large. The small fruits are unusually promising. N. T. A.

Rhode Island.

ASHAWAY, Washington Co.—No wheat; little barley or rye. Oat and corn area the same as last year—white oats; white flint corn. Prospect for both is good. Apples are all right; peaches are killed on low ground; on high they are unharmed. Blackberries and Black-cap raspberries are killed, Cuthberts are not. Strawberries are good. T. W. B.

PROVIDENCE ISLAND, Narragansett Bay.—Oats and barley are second-class crops hereabouts, generally consumed at home, and hardly merchantable on account of rust and wild radish seed—charlock we call it. Wheat is grown only experimentally—Lost Nation and Bliss's Defiance. Rye is a good crop and sells well; but the hand thrashing is an objection. Corn is our staple and surest crop—Rhode Island White Cap the popular variety. About 200 acres are grown annually on this island, which contains 3,600 acres. Planting has been much delayed; but we have no fear of frost for any planting made this month. Pears hang thick in many places; peaches unharmed. Many apple trees are dense masses of bloom. E. F.

Connecticut.

BRIDGEPORT, Fairfield Co.—Wheat and barley are not raised here to any extent. Oats are looking well, although put in late. Rye, where well put in, is very promising; some pieces on poor or badly tilled ground are indifferent—about the usual acreage of oats, rye and corn. Corn on wet land has not sprouted well, otherwise it is good for the season, although planted late. Very few apples and peaches. Pears are set plentifully. Grapes blossom freely. Strawberries a fair crop of good size. H. L. F.

CORNWALL, Litchfield Co.—An increased acreage of wheat of the Clawson variety. A smaller acreage of rye, oats, and barley. Rye and oats look well. A smaller acreage of corn which is very backward and looking sickly. An increased acreage of tobacco will be set; planting late. Grass never looked better. A heavy frost on the 7th inst. on low ground killed corn and potatoes. Prospect of abundance of small fruits. An average crop of pears. Less than an average crop of apples. Peach trees all winter-killed J. M. K.

DANBURY Fairfield Co.—Not much wheat or barley raised in this section; rather more rye than usual—looks well. Outlook for oats extra-good; but there may be too much straw. Usual acreage of corn; backward. Not a large crop of apples; trees healthy, however, and no worms, so that we have a good outlook for fruit. All small fruits will be abundant. J. O.

LITCHFIELD, Litchfield Co.—The general outlook for crops this year is quite favorable. The Winter was very cold and severe with a heavy fall of snow, making the Spring very backward and cold. The early part of May was dry and warm, later wet and cold Rye is looking well, having stood the cold Winter well; acreage about the same one year with another. No wheat is raised in this section Oats and grass a fair average. None but Winter rye sown here, the common white rye. Corn and potatoes are looking nice; acreage about the same as last year. Of apples the crop will probably be much smaller than last year. Small fruits are promising. E. P. B.

MINORTOWN, Litchfield Co.—Rye, oats and wheat are looking well. Barley is not much sown in this section. The grain crops are mostly corn and rye; next, wheat and buckwheat. The Fultz and Clawson varieties of wheat. Corn is looking well; acreage about the same as last year. Apples are not as abundant as last year. Strawberries look well; other small fruits not much raised here among the farmers. Pears and plums bid fair for good crops. C. A. F.

NORTH LYME, New London Co.—No wheat or barley to speak of grown here. Rye and oats are fully an average crop in quantity and appearance. Prospect for corn fair, but the weather is rather too cold for it; quantity about the same as last year. Grass looks fine. More apples than usual for an "off" year. Few small fruits raised. L. L. W.

WOODMONT, New Haven Co.—Wheat and barley are not raised to any extent about here. Oats are looking fair. Rye is looking fine, with a much larger acreage than for years past. By June 9, farmers had but just got through planting corn on account of the cold, wet weather. About the usual amount has been planted. Potatoes are looking well except on low or moist ground, but there they did not come up well on account of the wet weather; but there is more than the usual amount planted and with a fair season we shall have a full average crop. Potato beetles plentiful. The prospect for apples, cherries and strawberries is good. Peaches are a failure on account of late frosts. Pears blossomed and set well, but there is complaint of their being injured by insects. The grass crop is good on new meadows; but old meadows are light on account of drought last season; but there will be more tons of hay than last year. E. B.

MIDDLE STATES.

New York.

AFTON, Chenango Co.—Corn planting very late; acreage a quarter more than usual. Much less wheat sown than last year; it looks well; so do oats on an average acreage. Grass is excellent, and a superior hay crop is assured. The usual acreage of potatoes; a fair growth, but a vast superabundance of beetles. G. E. N.

ALBION, Orleans Co.—The acreage of wheat is about the same as for the last three years, and the outlook is good. Oats have the usual acreage, and the outlook is good. Barley acreage below the average, and outlook not very good. There is an average acreage of corn; the outlook is bad. Most of the crop has had to be replanted. The outlook for orchard and small fruit is good. C. O. H.

ALFRED, Allegany Co.—The prospect for wheat is decidedly poor; acreage about the same as last year—Clawson and Gold Medal mostly. Oats and barley pretty good—Probsteier oats and six-rowed barley. Corn now looks bad. Much has been planted over on account of poor seed and cut-worms. Apple, pear, plum and cherry trees loaded. Small fruits abundant; strawberries ripening. F. M. B.

BESEMER'S DEPOT, Tompkins Co.—Outlook for crops good, corn excepted. More wheat sown than usual; looks fine, but lodged considerably—mostly Clawson and Fultz. Oats look well. Very little rye or barley, but what there is looks well. Common white oats and two-rowed barley chiefly sown. Prospect for corn is slim; did not come on well. Many have planted over. A good many potatoes are raised; more planted this Spring than usual. Orchard and small fruits almost a failure. Grass heavy. B. G.

BURDETT, Schuyler Co.—The outlook for wheat is poor compared with that of last year—Clawson, Fultz and Mediterranean. Little rye raised in this county; Spring grain is looking well; there will be a good crop of straw. The prospect of corn is poor so far, owing to late planting, too much wet and cold weather—White Flint and Golden Drop Dent. Fruit of all kinds will be an average crop. Grass is fine, and hay will be an abundant crop. C. M.

CANAAN, Columbia Co.—The prospect for a large crop of hay is very encouraging. The oat crop looks fine; acreage about a fair average. Rye is a very large growth; many pieces are badly down; I fear it will not fill well owing to so much wet weather; the straw is thin and weak; quite one-third more is sown than last year. Corn is small and yellow—too wet and cold for it; about the usual acreage planted. Potatoes are having a hard time; bugs are taking them as soon as they are up. Apples will be scarce. The prospect for small fruit is fair. D. D.

COVENTRYVILLE, Chenango Co.—The outlook for wheat is fair—mostly Clawson. Oats, decidedly good. No barley; very little rye. Recent heavy rains and one severe frost have made the outlook for corn not encouraging; acreage larger than last year's. Apples have not blossomed as full as usual. M N. H.

EDDYTOWN, Yates Co.—Spring-sown oats and barley very good. Corn backward; much to be replanted. Grass fine; a good hay crop sure. Wheat considerably short of a full crop. Small fruits, first-rate. Potatoes quite largely planted. Apples in some orchards almost a failure; blossoms almost all blasted. W. H. O.

FRANKLINVILLE, Cattaraugus Co.—Wheat, oats and barley were never better. Corn has a poor outlook, however. Grass excellent, with promises of the heaviest hay crop we have ever had—a great advantage for this section whose chief business is the production and sale of butter and cheese. R. W. D.

GREENPORT, Suffolk Co.—This farm contains about 100 acres, 50 of which are now in grass, 20 in rye, 10 in oats, seven in corn, three in potatoes and 10 in pasture land. The larger farms containing several hundred acres will probably average in proportion about the same as the one I have given in detail. The grass crop in this county covers the greatest number of acres, and looks remarkably well at present. Rye comes next in importance; the straw has become a valuable commodity, being worth nearly as much as the grain; hence the upland and most of the arable land is usually sown in rye, which is more profitable than growing wheat, the latter is seldom seen. The outlook for oats, barley, rye, etc., is favorable—for rye and oats better than last year. Corn does not look well—too much wet and cold. Fully as much was planted as last year. Apples and peaches will be scarce, also small fruits, with the exception of field strawberries. R M. L.

GHENT, Columbia Co.—But little wheat sown in this county, and that is not doing very well. A third more than usual, and a promise of a large crop of straw. No barley. A larger acreage of oats than last year, promising a full crop. On account of the potato bug less potatoes have been planted, and more corn. Strawberries, cherries and small fruits are good; apples a light crop. Pears very large; plums medium. Peaches promise well. An unusual season for growth of all vegetation. Quite a large quantity of millet sown this Spring. G. T. P.

KILL BUCK, Cattaraugus Co.—Very little wheat or rye is ever sown here and no barley. The same area of oats as last year; it looks well. Almost all the corn has had to be replanted, and much of it is not up yet. Grass is fine—much better than last year. L. T.

LE ROY, Genesee Co.—About the usual quantity of wheat was sown last Fall and it promises to be an average crop—principally Clawson. Oats and barley fine. About the average acreage of corn; very backward and a poor stand; much of it required replanting. Apple crop light; berry crop good. Very few cherries and plums. W. L. B.

LEWISBOROUGH, Westchester Co.—The acreage of wheat is a little more than usual, but owing to the severe Winter the crop will be far less than an average. Clawson is mostly grown with some Treadwell. Rye and oats are looking well—about the usual area sown. The corn has the ordinary acreage and is mostly up and looking well; some has been once cultivated. Potatoes, the growing of which seems to be to a great extent superseded by that of onions, are looking well. The apple trees are nearly all enjoying a season of rest, this being the "off" year. Pear trees are well loaded with sets. J. A. W.

NUNDA, Livingston Co.—Spring work commenced late. Corn prospect poor. Wheat looks well except that on hard clay soil. Acreage about the same as last year. Clawson predominates, though White Michigan and Wicks are also sown. No rye Oats look well; more sown than last year. Not much barley sown, but what there is looks fair. Apple and pear orchards promise well. Few cherries and no peaches. Raspberries wintered well. Strawberries a small crop. Plums none. D. L. B.

STUYVESANT, Columbia Co.—Not much wheat or barley in this section. Our principal crops are rye and oats. The outlook for these is better than for some years past. The acreage of rye is larger than last year; that of oats about the same. Late rains have made the corn crop backward, yet the acreage will be larger than last year. Our apple crop will not be very large, but we shall have abundance of pears, plums and cherries. Grapes are good. E. A.

TOWNER'S, Putnam Co.—Farming commenced late this Spring, but oats are looking well. Winter wheat is only raised by a few—perhaps by one farmer in ten. It is not looking as well as last year. No Spring wheat is raised. Rye is looking well; acreage small: about the same as last year. No barley. Corn is backward. Apples are good for this "off" year; pears and plums are looking well; peaches not very well. Tobacco setting is later than last year. I think the acreage will be increased. Our farmers are principally in the dairy business; so they do not raise much grain: scarcely half enough for their home use. Meadows are looking better than they have done in three years. D, C. N.

WEST TOWN, Orange Co.—This is more of a dairy than grain-raising section. Farmers seldom put in more than two or three acres of small grain; but what is in looks well and promises a good average yield—Mediterranean wheat. Corn is backward; and much has to be replanted. No apples; plenty of pears; no plums; an abundance of small fruits. J. J. V.

New Jersey.

BRIDGETON, Cumberland Co.—About the usual acreage of wheat; some injured by the extreme cold. Promise of fair crops of wheat and oats. But little barley and rye raised. Red wheat of some variety generally sown. Where the corn has started it looks well; some have had to replant. It is said that, owing to the extreme cold of Winter when the corn was gathered not fully ripe and not well cared for, the germ was frozen, hence the failure to sprout; acreage is up to that of 1880. Orchard grass and small fruits do not promise full crops. C. E. E.

LOCKTOWN, Hunterdon Co.—The acreage under small grains is as large as, perhaps a little larger than, we have ever had. The outlook for wheat and rye is medium; for oats better than for several years past—Mediterranean wheat. The prospect for corn yield, as compared with last year, is fully equal; the acreage fully as large. The outlook for small fruits is very good. Orchard fruits will be from one-half to three-quarters of last year's crop. E. M H.

ORANGE, Essex Co.—The acreage of wheat, oats, rye and corn is about the same as in 1880. Wheat is not as good as last year; but rye and oats look well. Much of the corn planted before May 20, had to be replanted. Orchards are looking fair; more pears than last year; small fruits about the same. J. W. J.

TURKEY, Monmouth Co.—Of our arable land one-fifth is in wheat; one-eighth in rye and one-tenth in oats. Silver Straw, Fultz and Mediterranean are the sorts of wheat generally sown, and black and white oats and rye. The prospect is good for average crops. The prospect for corn is good, excepting where the seed was winter-killed and did not come up, which will make the last planting late. At least 10 per cent. increase of acreage over last year. Apples about half a crop; pears about two-thirds of a crop; peaches an entire failure, as the buds were all winter-killed. A great many of the trees, too, were killed to the ground. Blackberries nearly a failure; strawberries will be a very large crop; whortleberries will also be plentiful. Cherries about half a crop. Grapes look promising. The grass crop will be good though the acreage will be somewhat smaller than last year. J. H. C.

WEST END, Hunterdon Co.—Wheat looks bad; will probably make half a crop—winter-killed. Oats are looking fine; acreage larger than last year. Rye an average crop in appearance and acreage. Corn is backward, but it stands well. Fruits of all kinds are doing finely except peaches which are an entire failure. C. O. N.

WHIPPANY, Morris Co.—Acreage of wheat and rye larger than last year; outlook for both good—Mediterranean wheat. Of oats less was sown than last year, but the yield promises to be better. No barley. A large area under corn; outlook good. Small fruits abundant. Pears and cherries full crops; apples and peaches, less than last year. W. O. F.

YARDVILLE, Mercer Co.—Wheat—Amber, Clawson and Fultz—and rye and oats, all promise fine yields. Grass is splendid; but the hay crop will be light, meadows having been injured by drought last year. Vegetables plentiful. Peas, potatoes, sugar corn never better. Field corn just up is attacked by insect pests. Still all things agricultural are 25 per cent. better than last year. S. T. D.

Pennsylvania.

AIRVILLE, York Co.—Owing to the long and severe Winter the prospect for wheat is not as good as last year; moreover a hail storm on May 31 injured or destroyed many acres—chiefly Longberry and Fultz. Oats look well. No barley and but little rye. Wheat and corn are the principal grain crops. Corn is backward. Acreage of it and of wheat about the same as last year. Outlook for orchards tolerable; for small fruits, good. E. S.

ANNVILLE, Lebanon Co.—Wheat, full acreage and prospects of a full crop. Fultz, Red Chaff, bearded; Amber, smooth. Oats, full acreage and promise of a full crop. Rye very good, but not much seeded. Barley, none raised in this county. Corn a good stand; usual acreage. Apples, pears, plums, cherries and small fruits medium yields. No peaches. W. B. S.

CATASAUQUA, Lehigh Co.—Last year the proportion of arable land under wheat in this section was from 25 to 30 per cent.; this year it will be more than 30—Early Russian, Clawson and old Mediterranean, the last a favorite for 20 or 30 years. The rye stand is fine; but heavy rains of late have prostrated most of it. Little barley. It is feared an excess of rain will hurt the corn; the first down-pour washed out acres of it, which had to be replanted. Orchards are not so good as last year, especially apples. Hardly any peaches. C M'I.

EVERETT, Bedford Co.—The acreage of wheat is about as usual and the prospect about an average provided it fills well. The blades on parts of many fields are nearly or quite dead from rust, yet the straw does not appear to be affected. Oats are also about medium with smaller amount seeded. The rye raised is much less than formerly; it is looking well. The prospect for corn is poor: much of it was planted late, and a large part of it replanted, some the second time (or third planting) and some are now waiting for an opportunity to make a second or third planting. Apples are doing well. Peaches very scarce. Pears, few raised in this vicinity, a good stand at this time. Cherries somewhat scarce. Plums, but few cultivated. Strawberries more abundant and larger than usual. Grapes just in bloom; prospect good. The prospect now is that hay and pasture will be abundant. A. W.

KIDDER, Carbon Co.—About the usual acreage of rye and oats. Rye damaged to some extent, but will be about an average crop. Oats never looked finer at this season. Of wheat not enough is sown to deserve mention. No barley. Corn is rather backward on account of cool weather and frequent rains; acreage about the same as last year. The apple crop is very light, as this is the "off" year. No other fruits grown here to any extent. T. A. R.

MIFFLINBURG, Union Co.—Wheat acreage about the same as last year, and the yield promises to be at least one-fourth more—prospects for a good crop never having been better. The only danger now is that it may grow so rank as to lodge. Fultz is the principal sort sown. A number of our farmers have also sown Shumaker, which variety did well last year. Lancaster has also been sown to some extent. Clawson has been sown to a limited extent, but our millers do not like it. Oats look well as we had a good soaking rain last week. No barley or rye in this county, except only in small quantities. Some of the corn-fields look well, but owing to miserable seed a number of our farmers had to replant. The acreage is about the same as last year. Not many apples, this being the "off" year. Not nearly so many peaches as last year. On the whole, the farmer here has cause for thankfulness for the present prosperous outlook. The prospects for a full crop of wheat and oats are better now than for the last seven years. J. P. C.

NORTHEAST, Erie Co.—Wheat is looking fine where it was not winter-killed or smothered under deep snow. Acreage about as last year, but a great deal of it was killed. Some of our farmers plowed up every acre and sowed the land to barley—there will not be more than two-thirds as much wheat in this county as last year. The prevailing kind is the Fultz; but there is some Jennings and some Clawson. We think the Fultz for our Lake Shore soil is ahead of any. Oats and barley are now looking splendid. Of rye we do not raise much; Winter rye is good; it stood the Winter better than wheat. The prospect for apples is good—I think never better. Peaches none—all killed, and young trees killed to the ground. Grapes only a partial crop; a great many of the new canes were killed to the ground. Corn now looks hard. Almost every farmer had to plow up his first planting, refit and plant again. Acres and acres not yet replanted. Seed did not germinate. Some sent to Illinois for seed and others to Ohio. The hay crop not so

good as last year. A dry May hurt the clover. H. R. P.

PICKWICK, Clarion Co. — Wheat acreage about the usual average—Fultz, Clawson, Lancaster, etc. Oats late, about the usual acreage. Corn, the outlook very discouraging on account of poor seed, as nearly all had to be replanted. Acreage about the usual average, but some fields will be sown with buckwheat; Apples about half a crop; very few peaches; small fruits about half a crop—perhaps a little better. D. M. D.

SINNAMAHONING, Cameron Co.—Acreage of wheat and the outlook are a full average—oats the same. Fultz wheat. Corn acreage above average; condition average. Apples promise a full crop. Peach trees mostly killed with hard freezing. Grape-vines somewhat killed. Grass crop is promising. Potato bugs more numerous than ever; acreage of potatoes large. J. B.

VOSBURG, Wyoming Co.—The acreage of wheat is unusually large, and the prospect good. Oats extra-good. Rye better than an average. Corn was planted late, but it promises well; acreage about as last year. The crop of apples, cherries, etc., very short. Potoes well started; about an average acreage; bugs more numerous than ever before. Grass unusually promising. I. O. S.

WAYMART, Wayne Co.—No wheat or barley grown hereabouts. Acreage of oats about the same as last year; outlook good. Prospect for corn good; acreage a slight percentage over last year. This is an "off" year for orchard fruits; small fruits but little cultivated, but that little in excellent condition. C. M'N.

WHITE HOUSE, Cumberland Co.—Wheat in Cumberland Valley is looking well; continued rains prostrated many fields, but it has recovered, and with good weather we will have an abundant harvest. We have never had better prospects for oats. Corn has been very hard to get started, much of the seed having been damaged; one-fourth of all our corn has been replanted, but now it is up and doing very well. J. G.

Delaware.

CAMDEN, Kent Co.—Wheat acreage about the same as last year—chiefly Shumaker, Fultz and Mediterranean. Oats and rye are raised only to a small extent. There is a larger area planted to corn than last year, and it is looking well. Peaches are all winter-killed. The prospect for apples is better than for years. Cherries and plums are scarce; so are pears. Grapes are loaded and growing finely. Strawberries are in abundance—more and better than for several years. Blackberries and raspberries are badly winter-killed, but there will doubtless be a fair crop. H. M. D.

HARRINGTON, Kent Co.—About one-fourth more wheat sown hereabouts last Fall than in any previous season. Some early-sown fields are looking quite well; late-sown are light. Wheat will not average to the acre more than two-thirds as much as it did last year—Fultz principally. We have sown Clawson, Mediterranean and some other varieties, but we think Fultz does best. Rye, oats and grass will be average crops. The usual number of acres have been planted to corn. The prospect at present is not very flattering for a good crop. A great deal of seed failed to come up, and moles and worms took a great deal of what did. Many fields had to be replanted. The prospect is that the crop will be light. Peaches almost a total failure. A few orchards near large bodies of water will bear small crops. The prospect for pears and grapes is good for average crops. The apple crop will be the largest we have had for several years. Small fruits will be about an average crop. W. B.

SMYRNA, Kent Co.—The acreage of wheat is rather above last year's with the prospect of a full average crop—Mediterranean and Fultz, mostly the former. Oats do not yield well here, therefore there are not many sown—none for shipment. No barley or rye. The hay crop will be under the average; grass seed took very badly last year owing to the dry weather. Acreage of corn about the same as last year; standing not good, cut-worms have been very busy and the weather unfavorable. Peaches were all killed—the trees did not even blossom. Apple and pear trees were well loaded, but are shedding a good deal. Strawberries are a full crop; raspberries will be about half and blackberries one-quarter of a crop; they were badly frozen. "HUSBANDMAN."

Maryland.

CAMBRIDGE, Dorchester Co.—Wheat acreage about the same as last year; early-sown on fallow will be a good crop; that on corn ground generally poor, very light; the average will be a little less than last year—chiefly Fultz. Oats next to nothing; barley and rye none. Corn acreage same as last year; prospect better than at this time then. Apples a fair crop; peaches a very light crop—in many orchards next to nothing. Small fruits good. G. J.

CHURCH HILL, Queen Anne's Co.—Wheat promises well. The sowing here is generally late and last Fall it was not finished till Nov. 10, having been begun Oct. 10. The first-sown tillered better than that sown later, but was somewhat injured last Fall by the Hessian fly. Owing to the Winter having closed in too early and the Spring having opened out too late, wheat generally is thin from insufficient tillering, but the heads are unusually large and many farmers expect a full average yield. This country doesn't appear suited for oats, and very little indeed is raised here. They come light—not more than 18 pounds to the bushel. Rye thrives fairly well and will be a good crop. Barley is not known here. Corn looks well, though backward. Usually we plant it from March 10 to April 1, but this year scarcely a grain was planted before May 1, owing to the lateness of the Spring. The peach crop—our best crop, our money crop—is a total failure, except in a few small patches of country especially favored. Here we haven't enough for home use; indeed, thousands of people in this peach region haven't seen a peach blossom this year. Other orchard fruits are doing well; pears have bloomed heavily; apples are abundant, though they never mature properly. J. G.

COCKEYSVILLE, Baltimore Co.—The acreage of wheat is about the same as last year with a small decrease in oats and rye. The outlook is somewhat worse than in 1880, if there is any difference. Fultz is generally sown, having been found hardier and more productive than red or amber varieties. Prospect for corn, poor, only an extraordinary season can produce even an average crop. Owing to the seed rotting in ground several replantings have been necessary and the ravages of cut-worms have been extensive. Orchard promises very small. I. I. N.

DENTON, Caroline Co.—The acreage of wheat is larger than ever before; it looks moderately well, but it is two weeks later than usual. Fultz is chiefly sown. Acreage of corn about the same as last year; a poor stand, but fully two weeks late. No peaches in this immediate section; but there will be a partial crop in salt water situations less exposed than this region. J. W.

LINKWOOD, Dorchester Co.—An unusually large acreage of wheat was sown last Fall. Drilled wheat looks much the best, but will not be more than an average crop—chiefly Fultz. Oats are looking well. Corn looks fine and about the usual amount was planted. Apples, pears, and cherries and small fruits are giving promise of full crops. Peaches near salt water all right; away from water, killed. E. R.

MOLINE, Rock Island Co.—Little or no wheat sown—principally Odessa; looks well but has suffered from drought. Ditto rye. Oat prospect very poor. No barley. Grass a very short crop. Corn has about the same acreage as last year which was one-quarter larger than usual. Much yet to plant and replant. That planted will not average more than three-fourths of a stand. But few apples and no other large fruit; strawberries a failure—drought. Raspberries good. Snyder Blackberries all winter-killed. Rye crop short. W. C. W.

RUSSUM P. O., Wicomico Co.—Acreage of corn and wheat larger than usual. Corn late; wheat much winter-killed. Wheat — Fultz and Blue Stem; white mostly. Oats and rye good. Outlook for small fruits good. Apples and pears plenty. Peaches very few—in this section not one. Spring late; all crops ditto. Common potatoes good. We are setting out sweet potatoes and tobacco. Have had a fine strawberry crop; good prices. W. C. M.

WESTOVER, Somerset Co.—The following is the average acreage and probable yield of our crops as compared with a fair average:—

	Acreage.	Yield.
Wheat	110	80
Rye	100	100
Oats	100	90
Potatoes	120	90
Apples	100	100
Peaches	100	25
Strawberries	100	120
Hay	100	110

Of wheat we raise chiefly Fultz and Amber; of potatoes, the Early Rose and Beauty of Hebron. A. C.

WILNA, Hartford Co.—Prospect for wheat good for an average crop; some few fields winter-killed—mostly Fultz and Amber; acreage an average. Oats look well. More attention is given to tomatoes for canning. Over 100 factories will be in operation this season. Corn is much damaged by cut-worms; about the usual acreage planted. A large crop of apples and pears. T. H.

SOUTHERN STATES.

Virginia.

ABINGDON, Washington Co.—Acreage of wheat and oats about as usual. No rain at all during the month of May. Oats made no growth, but the rains now will bring them out. Wheat is generally heading very low and short; farmers think it will yield but very little more than half a crop. Where fertilizers were used and wheat was drilled, it looks fine and promises an average crop—mostly Fultz and Lancaster (red), some Tappahannock. The acreage under corn is as large as last year; but the prospect *now* is the worst for years. The crop was mostly planted in the first and second weeks of May; not more than one-fourth to one-third came up. The land was replanted, some furrowing out and planting again (so hard the stand), and it is just now coming up since the rains of the last week. Will not get a good stand now. The prospect is certainly bad. Peaches, a good crop; no apples of any consequence. A large crop of tobacco will be planted—setting now. Prices low. Currants, a good crop. W. B. K.

ANNANDALE, Fairfax Co.—The acreage of wheat is about the same as last year, and if it sustains no injury from the present moist weather the crop will be a full average—Fultz and Lancaster. Rye the same. Barley and oats not raised to any extent. Grass good. Corn has not come up well in consequence of drought, but the present copious showers will bring up that replanted and give a good stand. Strawberries very abundant. Peaches generally killed by the Winter. Apples an average crop. M. S.

BUFORDVILLE, Bedford Co. — Acreage of wheat about the same as last year; prospect bad. On all land inclined to be wet, and on light soils, it was badly winter-killed. Many crops stand thin on the ground. May was very dry. The blades on many fields are drying up with rust, and the quality of the wheat will be injured. Harvest will be later this year than usual. Fultz and Lancaster are the principal varieties. Oats, owing to the dry May and late sowing, must necessarily be a sorry crop, and much of the grass sown on oats and wheat has perished. The acreage of corn is about the same as last year. The crop has come up badly, and all the farmers complain of having had more replanting than they ever had. The dry weather was the principal cause of the corn not coming up well. Clover and meadow grass will be a light crop. Our apple and peach crops bid fair to be abundant. Strawberries dried up on the vines and were worthless. About the 1st of June we had rain—a good tobacco season, and planters made good use of it; there will be a large tobacco crop planted in this section. E. P. L.

HERNDON, Fairfax Co.—About the usual acreage of wheat and the prospect for a good crop was never better unless the continued wet weather injures it. Fultz and Lancaster are the favorite sorts; but some experimental sowings of Amber have turned out well. No barley. Rye looks very well—not much sown. Oats are sown by most farmers in small quantities; they are a very uncertain crop; the drought in May hurt them, but the rain we are having since June came in is helping them very much. Corn came up badly, the continued wet weather has prevented replanting or working and the cut-worms are working on it very injuriously. The outlook for a good or average crop is very uncertain. Acreage about the same as usual. Peaches are killed. Apples, pears and cherries will be very light crops. Currants, gooseberries, raspberries, blackberries and strawberries are above average crops, especially strawberries. Grass is doing well and the prospect for good crops of hay is very flattering. S. E.

LEXINGTON, Rockbridge Co.—Wheat is *now* unusually promising; the acreage is larger than last year, with a prospect of a better yield and a better quality—Fultz and Lancaster. The oat crop will be cut short on account of the unusual drought in May. Rye and barley are not sown in this section, except to a limited extent; prospect good. The outlook for corn is not good. Drought and the cut-worm destroyed the first planting; many farmers furrowed out and planted the second time. Acreage about the same as last year. Peaches to a large extent are winter-killed; only a few in favorable localities. Apples and pears promise average crops. Strawberries abundant and of excellent quality. Raspberries injured by drought, but give promise of an average crop since the June rains. I. C. B.

NOKESVILLE, Prince William Co.—The outlook for wheat is at present favorable for an average crop, especially in grain, but short in straw, owing to the dry Spring; acreage an increase of about ten per cent.—chiefly Fultz, with some fields of Clawson, Lancaster and White Amber. Oats, none sown. Barley and rye only in small patches hardly worth reporting; but favorable, what is sown. The prospect for corn is not very prosperous at present. Owing to the dry season and insects, the first planting was all destroyed. The replanted corn is coming up nicely; acreage about the same as last year. The outlook is good for apples for the trees are full of young fruit. Peaches are all winter-killed. Farmers have cut down their entire orchards and are trying to get a new stand of trees. We will have full crops of gooseberries and currants, raspberries and blackberries. Amber cane is a good stand; so are garden vegetables; we have a fine set of cabbages, sweet potatoes, beets, radishes, &c. Grapes are somewhat injured by the severe Winter, but not to a great extent. L. Y. A.

NORWOOD, Nelson Co.—Wheat acreage not large, but about as last year. Outlook for wheat and oats poor. A third, probably, less of wheat than last year—chiefly Fultz. Oats injured by dry weather; rains of last few days may much improve the crop. A good deal of Winter oats. The corn crop promises to be large; acreage about as last year. Farmers now plowing corn. Apples, with present prospect, will be abundant. In many places peaches were killed; in others a fair crop. Fine outlook for tobacco; plenty of plants and excellent season for planting. Potatoes look promising. A good crop of grass on lowlands; thin on uplands; not much attention paid to grass, though it pays better than any other crop on James River low grounds. W. H. K.

PENOLA, Caroline Co.—The acreage of wheat is an average one. Condition not more than 50 or 60 per cent. No barley. Very little rye. Acreage of oats, on account of late Spring, less than 50 per cent. Crop fair. Fultz, Tappahannock and Maryland White are the varieties of wheat sown. Of corn the acreage is 75 or 80 per cent. of last year's area. Growth small, and it is not in good condition. Apples, a full crop. Few pears. No peaches. Small fruits only for home use. T. B. H.

WINCHESTER, Frederick Co.—Outlook for wheat good—Lancaster, Amber and Fultz. Corn did not come up well. Orchards and small fruits good. W. S. M.

WOODSTOCK, Shenandoah Co.—Wheat acreage the same as last year. Much of it sown too late, hence short and thin. Three-fourths of last year's crop; but much may be made up in the filling; season thus far has been favorable to that end. Fultz, Lancaster, Mediterranean, Key's Prolific and Silver Chaff were sown. Acreage in oats and rye always small; both promise a good yield. No barley. The prospect for corn is not as good as last year; acreage the same. Outlook for apples good; no peaches; few pears; small fruits abundant. A. M.

WORSHAM, Prince Edward Co.—The acreage of wheat is about an average one and the prospect fair for about two-thirds of an average crop, say about eight bushels per acre—Fultz, with an occasional field of Wicks, Clawson and other varieties. Of oats we shall not make more than half a crop, if so much. No barley and very little rye. About the same acreage of corn as last year, but it has come up badly, though there is yet time for improvement. Of orchard and small fruits a full crop, with the exception of peaches, which were badly winter-killed in all low and unprotected situations. G. A. B.

West Virginia.

ACADEMY, Pocahontas Co.—Acreage of wheat and oats about the same as last year. Wheat promises only half a crop—Fultz almost exclusively. Oats promise hardly as well—Probsteier and black oats. Corn acreage about the same as last year; outlook poor until lately when splendid weather brightens the prospect. Owing to bad seed, much replanting has been necessary. Perhaps half a crop of apples; few peaches, or cherries; all small fruits were badly injured by drought which lasted 30 days at the critical period. F. A. R.

NEW CUMBERLAND, Hancock Co.—The acreage of wheat, oats and rye is larger than last year and the outlook is good. Fully half of the corn had to be replanted; the first stand is doing well. More put in than last year. Meadows and pastures excellent. Orchard fruits half a crop; small fruits abundant. J. L. S.

North Carolina.

ELIZABETH CITY, Pasquotank Co.—The acreage of wheat is very small this year—not one-half what was sown last year; stand very bad; frozen out; what there is is looking well: Fultz and Red Russian. Corn is looking very well; the acreage is about an average one; it is late on account of a backward Spring. Fruits have been cut off by early freezes; prospects poor. H. T. G.

GREENSBORO, Guilford Co.—Of wheat there is less than an average acreage; early-sown is good on fair land; the straw is short from lack of rain; the heads are over the average length and well filled, and are now beginning to put on the golden colors for the sickle, and the next ten days will finish up the wheat harvest. Late-sown does not promise a bountiful harvest; the straw is shorter than that of the early-sown, as are also the heads, and they are not so well filled. Quite a number of kinds are sown: Kivett, Purple Straw, Moten, Fultz, etc. The first has taken the lead for eight or ten years. Oats, fall-sown, on good land are fine; spring-sown will be a failure for want of water. Barley and rye are little sown in this section. The prospect for corn is the poorest I ever saw at this season. It is very small and a poor stand, after having been replanted two or three times. There is not an average acreage, as the land got so dry that farmers could not finish breaking—not enough rain for five or six weeks to break land. Peaches are al-

most an entire failure except on very high land. On low and level lands there will be no peaches, and in many places the trees are badly damaged by the severe Winter. Apples were very full of bloom; but in this section half or more dropped, and what are left are poor, knotty, wormy things that never can amount to much. Small fruits are not grown much; they do not succeed well here. Grapes do well and promise a fair crop; pears half a crop; plums not grown much, except the Wild Goose, which is always fine. G. L. A.

HALIFAX, Halifax Co.—Very little wheat sown. Oats not good on account of dry weather in May; no barley; very little rye; what rye was sown is very good. Twenty per cent. more cotton planted this year than last. Prospect very good. Less corn planted than usual. Fruit crops very good in most sections. B F. G.

LOWELL, Gaston Co.—Small grains—wheat oats, rye only—outlook very good. Acreage about one-eighth more than last year—fair for the county. Corn outlook good. Acreage 10 per cent. more than usual. Very little Spring oats. Peaches, none; small fruits awfully short. All fruits hurt by frost except grapes and apples; these abundant. An increase of 25 per cent. under cotton; it looks well. Weather dry. N. D.

South Carolina.

AIKEN, Aiken Co.—Acreage in wheat small, but quality good. Large acreage of oats; comparative failure of crop from the very dry Spring. Rye only in small quantities. Barley, none. Almost exclusively the small red rust-proof oats and small red wheat. Prospect of growing corn crop very good so far; acreage at least 25 per cent. less than last year. Outlook for fruit, fair. Peaches injured by late frosts, but enough left for a fair crop. Strawberries abundant; season over. Promise of grapes good. H. W. R.

Georgia.

ATLANTA, Fulton Co.—The acreage of wheat is somewhat below that of last year; but the outlook is good—no rust or blight—principally Dallas wheat (rust-proof.) Area under oats about nine per cent less than last year. Fall-sown grain, where not winter-killed, is very fine. Spring-sown grain cut off considerably by drought—Red, or Mexican Rust-proof, and Burt's Extra Early Rust-proof almost exclusively sown. Of barley and rye only a piece here and there for pasture. The acreage of corn is 102 to 100 last year. Bad weather caused late planting. Prospect ordinary; stand not very good. Pears short; peaches not over a quarter of a crop; apples an average one; grapes, fine; blackberries, abundant. M. J.

WASHINGTON, Wilkes Co.—Wheat acreage one-half as much as usual. Barley about an average. Oat acreage about as large as in the past year, but the crop is injured by dry weather in May. Rust-proof wheat and oats sown almost entirely; not known by other names. Prospect for corn is fair; about the usual acreage Apple crop abundant; peaches about half a crop; strawberries were cut off one-half by the dry May; raspberries a full crop; wild blackberries a heavy crop. J. C. D.

Alabama.

SELMA, Dallas Co.—Corn, I think, will be an average crop, though many complain that the dry weather is cutting it short. Last year's crop was a failure here. I have about five acres of the Blount Prolific, all from the seed I got from the RURAL a year ago. It looks well, considering the dry weather we have had. Cotton is looking well, and if it is not set back we shall have a full average crop. I think as a rule the prospect for all crops, except oats, is better this year than last. Irish potatoes are not much raised here; they are nearly a failure this season, the gardens being nearly burned up. Peaches are a total failure. Apples will possibly be a half crop. Strawberries were a short crop. J. M.

TUSCALOOSA, Tuscaloosa Co.—Very little wheat, rye or barley. Prospect for oats is poor—mostly red rust-proof. Prospect for corn is a shade better than last year. No peaches and very few apples or pears. W. C. R.

WOODSTOCK, Bibb Co.—Acreage of wheat smaller but prospects for good crop better than last year. Oat acreage much larger than last year and a splendid prospect. Corn acreage much larger and outlook very good. No barley and little rye. Cotton acreage about the same as last year, but outlook much better. M. Y. H.

Mississippi.

BROOKHAVEN, Lincoln Co.—No wheat, barley, or rye raised. Some oats which are doing tolerably well—are short and about ready for the cradle. Corn looks well in some places. The stand is poor owing to worms—acreage about the same as last year. No peaches; a few apples; cotton doing well. H. F. T.

LAWRENCE, Newton Co. Oat acreage far below an average on account of unfavorable weather for sowing; one-half a crop. Red rust-proof sort. Rye, barley and wheat, none. Corn looks very well and the acreage is about the same as last year. Some apples and plums. No other orchard fruit. Berry crop tolerably good. F. B. N.

OKOLONA, Chickasaw Co.—The acreage under wheat here is very small—mostly Blue Stem, Early and Late May and Golden Chaff. Of oats the acreage is large, and the prospects are for a good average. Of rye and barley there is none. Early-planted corn is not good; late-planted is a fair average—acreage less than last year. Fruit of all sorts will be very short. T.

SCOOBA, Kemper Co.—But little wheat and oats and no barley or rye, the sowing season having been so bad. The prospect for corn is good and the acreage will exceed that of last year. There is scarcely any fruit of any kind—all killed by cold weather. The orchard and small fruit business does not get much attention here; people are satisfied if they can get a little for home consumption. J. A. M.

Louisiana.

GREENSBURG, St. Helena.—No wheat, barley or rye is raised in this section. Most farmers sow oats (red rust-proof) and the outlook for it is fair. The outlook for corn is fine; the acreage an average one. There is an increase in the area of cotton. More attention is given to orchard and small fruits. J. S. D.

Texas.

College Station, Brazos Co.—No small grain of any account is raised in this section. Corn prospects are good; acreage probably somewhat smaller than last year by reason of the late Spring. Cotton is doing well. The fruit crop was injured by late frost, especially peaches. Apples but little grown. Pears and grapes good. C. C. G.

NEW PHILADELPHIA, Wharton Co.—Corn and cotton are the principal crops grown here. Corn will be an average crop, although in places a little irregular; the blackbirds destroyed it when it came up and many people have had to plant two or three times. Cotton is rather late on account of the first planting having been destroyed by the frost; but it will make a fair average crop. We want rain very badly; all kinds of vegetation are dried up, the thermometer for the last three weeks has ranged from 90 to 95 deg. in the shade. Potatoes are not more than half a crop; the country is infested with millions of potato bugs, which have nearly destroyed the crop, and now the dry weather has finished it. Peaches are a good crop; and we have been using ripe pumpkins and watermelons (Gipsey and Peerless) for more than a week. The Rural Branching Sorghum is looking splendid; plenty of roots with ten and twelve branches; it is far ahead of other sorghums planted side by side with it. R. B.

Arkansas.

Hot Springs, Garland Co.—Very little wheat sown—only two picayune grist mills in the county. Oat acreage small, but the crop looks well; 25 to 50 bushels is the usual yield per acre. Rye is sown only for Winter pasture. Of tamegrasses we have scarcely any, but they do well. Corn is looking fine, but it is terribly in the grass; acreage increased, but not enough raised to supply this market, there being as yet but a small portion of the land in this immediate vicinity in cultivation, and a large part of that is devoted to trucking and dairying. There are a good many orchards, and there will be about one-third of a crop of apples and peaches; plums, a full crop of the Chickasaws; peaches, some; pears, none. Strawberries, the finest crop ever grown; grapes, blackberries, raspberries are good crops. F. J. B.

Kentucky.

ELKTON, Todd Co.—Wheat acreage about 70 per cent. of an average; prospect 70 per cent.—Boughton and White May. Oats an average crop. Corn acreage 100 per cent.; prospect good, but later than usual. Outlook for small fruits and peaches good. Apples scarce. E. B. E.

HENDERSON, Henderson Co.—The outlook for wheat is promising; acreage 10 per cent. increase, and the prospect for yield and quality fully 20 per cent. better than last year. The crop promises to be the best one raised in the county. Our stiff river bottom lands, which have been cultivated for years in corn, are now proved to be the best wheat lands in the country, the yield being 30 to 35 bushels, and sometimes more of grain over the standard weight. Oats a failure and barley not worth mentioning. The varieties chiefly sown are Fultz 50 to 60 per cent. and the remainder White Winter and Mediterranean about equally divided. The latter is considered the best of all, being hardier and the yield much greater. The prospect for corn is decidedly bad. The acreage is as large as last year or larger; but it has come up very badly owing to the fact that in nine-tenths of the crop last year the germ was frozen and killed and unfit for seed, which fact was not known to the farmers until after trial. The crop is very late and many are still planting, and unless the season is unusually favorable the indications now are that the yield will be from 20 to 25 per cent. short. The outlook for orchards is not good. Peaches generally killed, except seedlings or in very favorable localities. The apple crop is generally a failure and the pear little better. Blackberries and raspberries are killed, but the strawberries were never better. The varieties succeeding best are Sharpless, Chas. Downing, Longfellow and Warren. The Crescent Seedling is enormously productive when fertilized. Grapes are badly damaged, except iron-clad varieties, such as Elvira, Warden, etc. Even the Concord is seriously injured. Other small fruits will give a fair crop. J. C. A.

Tennessee.

ADAIR'S CREEK, Knox Co.—The acreage for wheat is 20 per cent. more and the yield per acre will be 30 per cent. less than last year—bearded, locally called Swamp-Bearded, Fultz and Boughton. Corn backward but looking well; about ten per cent more than usual planted. Oats will be very short. But little rye and no barley is raised. Orchard fruits good; small fruits very poor. T. B.

MORRISTOWN, Hamblen Co.—The outlook for all wheat is not promising. The yield per acre will probably not exceed half that of last year's crop and the acreage is 25 per cent. less. Fultz, Silver Chaff and Quaker. Rye, barley and oats are mongrel, but little pains having been taken about seed; prospect fair for half crop. Early planted corn looks well; late planted has, owing to the late drought, failed to come up well and looks very unpromising. Acreage about same as last year. There will be an average crop of apples and peaches. Small fruits are mostly a failure. W. G. T.

VICTORIA, Marion Co.—Outlook for wheat fine, acreage average—Mediterranean, Fultz, Harris. Corn outlook good; rather more put in than last year. Orchard and small fruits prospect about as usual. W. W. F.

WESTERN STATES.

Ohio.

ATWATER, Portage Co.—The acreage of wheat and oats is about the same as last year, with a fair prospect of a large yield. Wheat is beginning to lodge, which may prevent its filling well—Fultz, Wicks Early White and Blue Stem: a little of the Silver Chaff sown here last Fall. Corn has come up and is generally standing well, with an acreage about the same as last year, There is a fair prospect for apples, but not as many as last year. Grapes and other small fruits are looking well where the vines were not killed by the Winter. Potato beetles plentiful. O. M.

BELLEVUE, Huron Co.—Wheat is our principal crop, and that which was sowed early is good, but the late-sown amounts to nothing. The acreage is about the same as last year, but it will fall a little short of an average crop. Owing to the late Spring but little barley was sown. Oats are short, and corn small. Our fruit crop will be almost a failure. S. D. S.

BENNINGTON, Morrow Co.—Wheat acreage the same as last year; yield, three-quarters as much—Fultz and Lancaster. Oats three-fourths of last year's area; prospect of yield per acre, quite as good. Acreage of corn the same as last year; outlook poor owing to bad seed and unfavorable weather. Grass very good. Orchards injured by hard winter—about one-fourth of a crop. Blackberry bushes killed; grapes badly winter-killed. All insect pests abundant and active. T. W.

BLOOMINGTON, Clinton Co.—Acreage of wheat in this section about three-fourths of last year's average; stands thin and straw is very short. Mediterranean, Egyptian, Fultz and some Clawson. Small acreage of oats and prospect very poor owing to three weeks of drought in May. No barley or rye. The acreage for corn and the outlook are about the same as last year, only it is a little later. It is our principal crop. Meadows will be very light owing to drought in May—the month that makes the hay crop. Wool is selling for from 33 to 35 cents per pound washed. The crop of apples will only be fair—not an average. Peaches will be an average yield. Hardly any pears. A fair prospect for cherries. The raspberry vines were badly winter-killed; yield will be light. The outlook for early potatoes is not good on account of potato beetles, which are very troublesome. Live hogs are worth $5 50 per 100 pounds; cattle about $5; mutton about $3.50. F. C. D.

BOWLING GREEN, Wood Co.—No rain this Spring till June 1; since then plenty and to spare. This county is mostly very flat, black, sandy and gravelly soil underlaid with limestone. The drainage has been quite thorough in some parts of the county and elsewhere tiling is being pressed forward, and the land is as productive as can be found anywhere. The acreage under wheat is greater than last year. It is very short and thin, however, but it has been improving rapidly since rain began to fall. We shall probably have about 75 per cent. of a crop. Oats are improving finely. No barley or rye to speak of. Fultz is the only variety sown here, except a few pieces of Clawson. Corn came up badly on account of the drought. It has improved somewhat since rain fell; but little cultivation has been done yet. A decrease of acreage. Poor prospect for all kinds of fruit; not enough for home consumption. J. B.

BRIGHTON, Lorain Co.—The prospect for wheat is about the same as last year, with a small increase in acreage—Lancaster, Fultz and Red. Oat prospect and acreage about the same as last year; a fair crop. The prospect for corn is poor; much second planting has had to be done, and it all looks backward; acreage about the same as last year. The outlook for orchards is about half a crop. There will be a good crop of small fruits. E. A. F.

BUCYRUS, Crawford Co.—Wheat acreage 10 per cent. above last year's; probable yield, 75 per cent. of last year's—Fultz, Mediterranean, Todd and a little Clawson. Oat acreage three-quarters of last year's; sown late and kept back by dry weather. Corn acreage less than last year's; it is very backward. A. A.

CAMDEN, Preble Co.—Late rains are helping, but there's a good deal of wheat beyond redemption, owing to drought and the fly. Oats, flax and meadows may recover somewhat, but at best they will be injured considerably. Corn that wasn't planted till the dry weather set in didn't come up well, and many are planting a second time. Bad seed, dry weather and cut-worms have been the causes of failure in the first attempt. W. M.

KINGSTON, Ross Co.—The acreage of wheat is one-fourth greater than last year; but the yield per acre will not be more than one-half what it was in 1880. Very few fields are sufficiently high to be cut with machines, and a great deal is not more than one foot high and it is now heading. Our chief varieties are, Gipsey and Fultz, with some Clawson and Michigan Amber and a nameless sort called "white bearded." Oats, barley and rye are little sown in Central Ohio. What little barley there is looks well. Prospects for corn are not flattering owing to a late Spring, bad seed and dry weather. Acreage about one-fourth less than last year. Plenty of fruit for home use with some to spare. O. P. G.

HUDSON, Summit Co.—The acreage of wheat is larger than last year, and all early-sown wheat looks as well as it did a year ago; late-sown looks poorly. The crop of this county will be about 85 per cent. We are getting some fine showers, and cool weather now and wheat and oats are doing splendidly. Not as much oats were sown here this Spring as last, and they were looking very poor until the showers of the last three days started them. No barley, and only a little rye; but that looks well. Not as much corn as a year ago. In fact, some farmers sowed so much wheat that they have very little room for other crops. Corn is looking well. The apple crop will be very small; so will the cherry and pear. The hay crop will be short unless we get plenty of rain the rest of June. E. A. S.

MECCA, Trumbull Co.—The acreage of wheat and oats is about the same as last year; they look first-rate. Barley and rye are not raised here. Varieties of oats, White Russian, Probsteier, Surprise; and of wheat, Clawson, Fultz, Democrat. The last variety takes the lead here. Millers will pay 15 cents a bushel more for it than for the others. The acreage of corn is less than last year; it looks poorly. Orchards are medium; not as good as last year. Peaches, none; grapes and other small fruits about half a crop. H. L.

MENDON, Mercer Co.—Wheat acreage of this year equal to that of last and the present prospect is that we will have a good average crop; on bottom lands it is heavier than last year; on uplands it is shorter and thinner but heavier in the head—mostly Fultz. The prospect for corn is fair if the Fall is favorable for maturing. The acreage is fully equal to that of last year. Orchards are badly injured by the Winter—fully one-third both old and young. Blackberries are killed to the ground. Black-cap raspberries not killed; full of fruit. T. F. E.

MENTOR, Lake Co.—The acreage of wheat is about the same as last year; the drought has hurt it very much, but rain has come just in time and I think we shall have an average crop—mostly Clawson and Fultz. Oats look very well and there is about the same acreage as last year. Corn is very backward, most of it is only just up; about the same acreage as last year. There will be some peaches; berries are plentiful. H. D. G.

NEW LISBON, Columbiana Co.—The acreage of wheat is 25 per cent. less than last year, and the probable yield fully 33 per cent less. Fultz, Clawson, Old Blue Stem. Oats in acreage fully up to last year and in outlook 50 per cent better; from present appearances they will lodge badly. Corn looks pretty well;

worms working pretty busily; but an average in acreage and outlook. The grass crop made a poor start on account of drought; but late rains insure a heavy yield. E. C. L.

NEW PHILADELPHIA, Tuscarawas Co.—The acreage of wheat is about the same as last year, but the yield will be fully one-third less. The valley will yield nearly a full crop; the hills not over half a crop. Fultz, Lancaster, Blue Stem, Clawson and French Mediterranean are chiefly sown. Oats look fair. Owing to the lateness of the season only half the acreage of last year has been sown. What little rye and barley there is looks well. The prospect for corn is fair although much had to be replanted as the seed did not germinate, having been injured by the cold Winter. The acreage is about the same as last year. There will be about half a crop of apples and a large crop of peaches on the hills, but none in the valleys. All the small fruits promise well, except the grape, which has been badly winter-killed, the Concord even being greatly injured. There will not be one-fourth of a crop. There will be a better crop of hay than for several years. G. L. T.

NEWVILLE, Richland Co.—Wheat acreage less than last year's; prospect not as good—Fultz and Amber. Barley good; not much sown. Oat acreage small; prospect good. Rye poor; little sown. Corn prospects poor—cut-worms and poor seed; acreage less than last year. Light crop of orchard fruit; "off" year for apples. The small fruit prospect is good. I. F.

PLEASANT CORNERS, Franklin Co.—Wheat will be about three-quarters of last year's crop. Corn is small and backward; not a good stand, but we are having good rains which will help it out. No rye, oats or barley. Will have some fruit. W. M. F.

PULASKI, Williams Co. — Wheat acreage about average; outlook for about one-half crop, chiefly Fultz and Clawson. Oats very backward and not looking well.—about two-thirds of an average crop. Rye, three-quarters crop. The corn prospect is pretty fair, but the crop is very backward. No apples, pears and peaches; and about half a crop of small fruits. I. P. R.

POMEROY, Meigs Co.—A poor prospect for wheat in this county; some ground will not yield the seed sown. None will average over five or six bushels per acre. This year I will not harvest more than six or eight bushels per acre; my usual average is 28 to 30 bushels of Tappahannock. The varieties chiefly sown are Tappahannock, Red Lake and Mediterranean. Oats are short and some will not be worth cutting; barley ditto. Rye is not much sown; what there is looks well. Grass has a fair outlook and a prospect of a fair crop. Corn is very backward on account of poor seed, a late Spring and drought. A number of fields have been replowed, and the rest is mostly a poor stand, averaging about one stalk to the hill. The late rain will give some relief, but the outlook is poorer than last year. Apples and small fruits, average crops. Pears and cherries will fall quite short. J. M. T.

TONTOGANY, Wood Co.—It is but a few years since there was scarcely enough wheat raised here for home consumption; corn was the principal crop, but now farmers are raising more wheat and less corn. Up to the 1st of April wheat looked very well, but from that time until the 1st inst., we had no rain of any account and many pieces are nearly ruined, the late-sown suffering most. Oats not so much sown as usual, and crop short; but they may yet make a fair crop. Barley and rye not grown here to any extent. Corn is far behind what it was at this time last year; it has come up very unevenly; a great deal of the seed swelled and dried up or rotted, there not being moisture enough in the ground to make it grow. I have a piece of soil that has been planted four weeks, and three-quarters of the seed is just sprouting. Lots of replanting, some fields being planted over entirely. Acreage not as large as last year, as wheat seems to be growing in favor. Fultz, Clawson, Mediterranean and Gipsy are the principal varieties, with Fultz ahead. There will be some apples but no peaches, and many of the trees were winter-killed. Cherries abundant; currants, ditto, if worms do not destroy them, of which there is a fine prospect at present. Strawberries, a short crop on account of drought. Colorado bugs by the bushel. G. S. K.

Indiana.

BARNARD, Putnam Co.—The acreage of wheat is hardly so large as last year—mostly Fultz which has proved the most hardy and prolific. Of oats and other small grains but little is grown. The prospect is fair for a good corn crop. The acreage is up to or above last year's. Orchard products a failure. I. S. H.

BOURBON, Marshall Co.—The acreage for wheat is quite large; but owing to the extremely dry weather the yield will be somewhat smaller than last year—perhaps not above 12 bushels per acre throughout Northern Indiana.—Fultz and Gipsey. Oats will be very short; on account of drought but little is sown throughout this part of the State. Corn looks tolerably well: about the same amount planted as last year. Orchard fruits will be less than last year; so will small fruits. Peach trees are badly winter-killed, S. B. T.

CROWN POINT, Lake Co.—The outlook for all the different crops is unusually encouraging. Both Winter and Spring wheats do poorly here, consequently very little is raised; only an occasional farmer has the temerity to attempt it. Now and then a field was sown last Fall, but the severe Winter, together with the dry Spring weather, has about finished it. Oats promise an abundant harvest. The severe drought in May shortened the stalks and the late rains give the fields a vigorous, healthy look. The acreage is about the same as last year. Old-fashioned black oats, the chief variety. The prospect for corn has not for 20 years been better than it now is. The acreage is something larger than last year. This is not a fruit region, and what fruit trees we have were more or less injured by the severe Winter. H. C. C.

DECATUR, Adams Co.—Wheat acreage about equal to that of 1880; outlook not as favorable by at least 30 per cent.; owing to dry weather in May straw will be very short. Fultz and Mediterranean; no Spring wheat sown. Oats owing to dry weather look bad, recent rains may bring them out somewhat. Rye looks well; but little, however, is sown. Corn on stubble ground is good; on sod it is damaged by cut-worms; a great many have planted the third time; acreage equal to last year's. Orchard and small fruits not over one-third of a crop. D. C. W.

ELKHART, Elkhart Co.—Oats are doing pretty well; if the weather is favorable we shall have our average crop—40 bushels per acre. W. B.

HALL'S CORNERS, Allen Co.—Wheat acreage 10 per cent. less than last year's; outlook not so good—Lancaster, Tappahannock, Clawson, Todd, Mediterranean. Area under oats 25 per cent. less; outlook fair. Corn acreage about the same as last year; prospect very poor. A dry May and poor seed caused much replanting and a poor stand. Good outlook for apples, cherries and small fruits. No peaches. Currants and gooseberries nearly all destroyed by insect pests. W. H. H.

HARRISBURG, Fayette Co.—The acreage under wheat is an average one; but the yield will not be over eight to ten bushels per acre—the stand is short and thin. Oats are not a good crop. About the usual area of corn has been planted, and with a favorable season henceforth there will be an average crop. Apples in fair supply; many trees killed: no peaches; trees nearly all killed. Small fruits plentiful. Our present opportune rains will better the chances for all crops. W. W. T.

LAGRANGE, Lagrange Co.—Wheat acreage large; yield, less than one-half a crop—mostly Fultz and Clawson. Oats fair. Of barley and rye very little sown. Corn acreage large; outlook excellent. Apples a light crop; peaches none; cherries plentiful; grapes an average crop; blackberries badly winter-killed; raspberries, abundant; also, strawberries. Potatoes look well, but are very buggy. N. S.

LA PAZ, Marshall Co.—Spring warm and dry until this week; raining every day now. Wheat will be half a crop—Fultz, Lancaster and Diehl. Oats and corn look well. Small fruits plentiful; but the currant worm is stripping the currants and gooseberries. Strawberries are fine. Apples, pears and cherries promise full crops. Peaches all winter-killed. Stock is doing finely. Wheat, $1. Corn, 45c.; oats, 35c.; butter, 10c.; eggs, 10c. E. E.

LA PORTE, La Porte Co.—Wheat acreage larger than last year; outlook gloomy; not much over a quarter of an average yield per acre—principally Lancaster, Fultz and Gipsey. Prospect for oats fair—mostly Surprise. Corn acreage larger than last year; outlook good. Apples one-tenth of a crop; no peaches or plums; half a crop of small fruits. J. S.

MOORFIELD, Switzerland Co.—Weather very dry; no rain for four weeks till 7th inst. About the usual acreage of wheat; badly winter-killed; will not make over half to two-thirds of a crop. Oats short growth; about the usual acreage. Barley and rye not much cultivated here. Corn backward; planted very late. Small fruits scarce. Apples and peaches fair crops. Grass short; will not make over half a crop of hay. J. C.

PITTSBURG, Carroll Co.—Acreage of wheat about the same as last year; the yield will be only about one-third of a crop, with the fly working upon this third to a considerable extent in some localities—mostly Fultz. The outlook for oats and Spring barley was not flattering up to first of the month owing to the drought; but since then there has been plenty of rain. Winter barley a complete failure. The corn prospect is splendid, although in some few fields the grub-worm has done considerable mischief. The acreage is at least 25 per cent. more than last year. Apples and all other orchard fruits are failures, except pears; the latter promise a bountiful crop. J. T. S.

PLAINFIELD, Hendricks Co.—Fully an average acreage of wheat was sown; but the prospect is poor for an average crop. Of corn there is an average acreage; but much of it was injured by cut-worms, moles, poultry and dry weather; a good deal of replanting. Fultz wheat; white oats and dent corn. Fruit prospects poor: apple buds killed and wood injured. A small area of oats was put in and the outlook for that is poor owing to the late Spring and dry weather. Very little barley or rye is raised. E. H. C.

SANDBORN, Knox Co.—The acreage of wheat was large, but part has been plowed up and put in corn—will be from one-third to one-half a crop; shortage due to the fly and freeze this Spring. Corn not all planted yet; wet Spring and bad seed the cause; much replanting to be done; a great many cut-worms. This is a wheat and corn country, with some grass and stock. Little oats; no rye. Fruit enough for home use. Prospects gloomy for the year. J. H.

TERRE HAUTE, Vigo Co.—Wheat acreage as large as, or larger than, in 1880. Farmers report it won't exceed half the crop of 1880 but late rains may increase this—Fultz and Amber. Oats not much sown; prospect poor. Corn acreage about as last year; very backward; bad seed; replanting will have to be done. Apples promise nearly an average crop; no peaches; pears very short. A drought has cut off strawberries more than half; recent rains will help late ones. J. A. F.

WILLIAMSBURG, Wayne Co.—Acreage of wheat about the same as last year: prospect for not over half a crop per acre on an average—Fultz mostly. Oats half as much as usual sown; prospect very poor. Barley and rye are not raised in this section to any amount. Meadows will be very short and thin owing to dry weather. Of corn the usual amount has been planted; but it came up poor and is badly injured by worms. Prospect not so good as last year. Fruits almost a failure. Apple orchards badly winter-killed. Grape-vines, blackberries and raspberries are so badly injured as to cause a failure. W. M. H.

ZIONSVILLE, Boone Co.—Wheat stands thin on the ground; there will not be more than half a crop, although the acreage is larger than usual. Oats look well. The acreage of corn is much larger than ever before, and it looks enconraging. Potatoes promise a good crop—a large acreage. Apples and small fruits are scarce—many apple trees as well as small fruits were killed by last Winter. N. M.

Illinois.

ASHKUM, Iroquois Co.—Little wheat is raised here but that looks very well. Oats look well; rye good; barley but little sown. The acreage of corn is about the same as last year, but the prospects are good for much finer crop. As a rule the prospects for crops are much better than last year. J. F. V.

BAILEYVILLE, Ogle Co.—Winter wheat almost all failed—was injured by dry, hard freezing last December, and again by freezing and thawing in March and April. The ground was reseeded to Spring wheat and oats. Considerable Fultz wheat was sown last Fall. Mammoth and Fife are the chief varieties of Spring wheat. Rye will be thin. Oats and barley about average crops. Corn—acreage somewhat increased; fair prospect if the weather proves favorable. Scarcely any apples or cherries. About average of Chickasaw and common wild plums. W. B. D.

CHICAGO, Cook Co.—Very little wheat is grown within a circuit of 30 miles of this city. Corn and oats are the principal grain crops, with some barley. About the usual acreage planted with fair prospects—Surprise Oats and four-rowed barley leading kinds. The country around Chicago is greatly devoted to dairying, butter and milk always bringing good prices in this market. Have had quite a dry spell, but the bounteous rains of the past two days, providing we have warm weather, will make the crops fairly jump. Apples, pears and cherries will be scarce. Although many of the trees were fairly filled with blossoms they set very little fruit. Currants and gooseberries will be fair crops, but raspberries are killed back to 12 to 18 inches from the ground. G. P. W.

CUSTER, Will Co.—But little wheat or barley is raised here. Oats and rye are looking well. The large white rye is mostly sown. At least ten per cent more oats this year than usual. The prospect for corn is very good except on low ground, which was injured by recent heavy rains. The acreage is somewhat smaller than last year's. Apples, plums and cherries are almost a failure. The prospect is good for small fruits. T. W. W. B.

FARMER CITY, De Witt Co.—The acreage of wheat was larger than usual, but the prospect is wretched. The area of rye was cut short by hail storms at sowing time; the yield, too, will be light. The acreage of oats is very large and the outlook good. The area under corn is much larger than last year and the outlook is fine. Orchard fruit will be scarce; small fruits pretty abundant. W. L. D.

LANE, Dewitt Co.—The acreage of wheat exceeds that of last year; prospect gloomy. Oats, rye and barley have a small acreage; prospects not flattering; the chinch bug has made its appearance. Corn prospect good; about the same acreage as last year. The outlook for orchards and small fruits, with few exceptions, is very discouraging. J. S.

LA PLACE, Piatt Co.—Crops are looking well, considering the late Spring and dry hot weather for three or four weeks up to this week when we have had two nice rains which have done a good deal of good. Corn is all planted and up and is looking well, some having been plowed twice. Winter wheat was partially killed. Rye and oats good. Pastures excellent. Cattle and hogs fat and healthy. E. L. B.

LODA, Iroquois Co.—But little wheat is sown here and that is badly winter-killed. Of oats more is sown than last year, and the outlook is good. Barley we can't raise here. Rye is a sure crop, but the price it brings won't pay—40 to 60 cents per bushel, so we raise but little. The prospect for corn is good; not so much is planted as last year. Peaches, none; apples, only a few; cherries still fewer; all other small fruit, plentiful. A. P.

MINONK, Woodford Co.—Very little wheat raised here, owing to much that was planted having been winter-killed. The usual acreage of oats; prospect good. Corn acreage about the same as last year; prospect good. Outlook for orchard fruits very poor; ditto for cherries. Other small fruits moderately good. R. D.

NAPLES, Scott Co.—The acreage of wheat sown last Fall was the largest ever put in here; but owing to the severity of the Winter fully one-half of it was plowed for other crops. What was left is thin on the ground, but the heads are large. This county will produce only about 20 per cent. of last year's crop—chiefly Fultz and Gold Drop. Oats will be almost a failure. Rye will be up to the average and the acreage about the same as last year. The prospect for corn at this time is good, never a better stand and all of it is clear of weeds; the acreage is more than double last year's. Apple trees were loaded with bloom, but owing to a protracted drought, the fruit has fallen badly. Peach buds were all killed, and so were some of the trees. Pears and cherries will be light; strawberries almost a failure; raspberries scarce. The Gregg appears to have gone through the Winter the best of all and will make a fair crop. E. M.

ROCKTON, Winnebago Co.—Winter wheat almost all winter-killed; Spring wheat looking well. Oats fine. Rye just middling. Corn is very late; acreage about the same as last year. Pastures and meadows fine. Very few small fruits raised here. J. B.

RUTLAND, La Salle Co.—Winter wheat about all killed out. Spring wheat none sown. Oats more sown than usual; they look well. Rye looks well; not very much sown. Oats is the only small grain grown here to any extent. The prospect for corn is good, if the weather is favorable. It is somewhat late owing to the backward Spring, but the ground is in a better condition than it has been for a number of years, cleaner and looser. Acreage about the same as last year. For orchard and small fruits the outlook is very slim. Potatoes are growing nicely—mainly Early Rose and Peachblow. J. W. P.

SALEM, Marion Co.—The average outlook for farm products in this county is as follows: Wheat, 20 per cent. of an average crop; corn, 100; oats, 100; hay, 50; apples, 80; raspberries, 100; blackberries, 100; strawberries, 75; gooseberries, 100; currants, 100. Insects have injured the wheat to the above extent and are now threatening corn and oats. No damage yet from the Army worm. L. M'C.

SENECA, Lasalle Co.—There is no wheat sown about here this year. Oats have a larger acreage than last year and look well. No barley and very little rye. There is about 10 per cent. more corn planted than last year, and it is clean and in good condition, but we have had very heavy rains during the last few days, which will delay cultivation nearly a week, even if we have fair weather. Very few apples and pears; no cherries; strawberries a good crop; currants and gooseberries about an average; raspberries winter-killed—below an average. The Snyder Blackberry is all right. Grapes are not more than one-fourth of a crop. D. L. C.

STONE CHURCH, Washington Co.—Wheat generally is thin and full of chinch bugs and Hessian fly. Fultz and Red Sea are the favorite sorts, the former seeming a little more prolific than the latter. It also appears to be improving in quality rapidly; three years ago millers would pay from five to seven cents more for Red Sea; two years ago they would make no difference; last year, they gave from three to five cents more per bushel for Fultz than for Red Sea. Corn is splendid: but the

cut-worm is working fast among it. No peaches; some pears and plums; apples a fair crop. A. S.

TURNER'S JUNCTION, Du Page Co.—The outlook for wheat is poor; for rye, fair; for oats, good. This being a dairy county, corn and oats are the main crops. The prospect for corn just now is not very exhilarating owing to cool weather; acreage the same as last year. Orchard and small fruits complete failures. A. F. R.

VOLO, Lake Co.—The acreage of Spring wheat is about one-third of last year's; it was a month later before the land could be worked. Winter wheat was killed and plowed up and the land put to Spring wheat or corn. Winter rye (no Spring rye) badly hurt. Oats about three-quarters of last year's acreage. Spring wheat mostly White Colorado and Lost Nation, which are taking the place of the old varieties. The acreage of corn will probably be one-third more than ever before, the Spring having been so late. A great many farmers are putting most of their arable land into corn. Some have got through planting; some will plant until the middle of this month. Apples a light crop—about enough for home use. Cherries a small crop; peaches none; other small fruits promise well. Potatoes, early (planted fore part of May), look fine. No beetles. Grass is as forward as last year. We raise more stock than grain here. Most of the butter and cheese factories here run all Winter, so that between cows, horses, hogs and sheep, we use up a large quantity of the grain we raise. T. D.

Michigan.

BATTLE CREEK, Calhoun Co.—Wheat not over one-fourth of an average crop—mostly Clawson. Oats look fine. Most of the corn had to be replanted owing to bad seed; acreage about the same as last year. Grass fine. Fruits of all sorts short. S. C. B.

BLISSFIELD, Lenawee Co.—Wheat acreage is increased about 10 per cent.; outlook poor, from a cold Winter and dry May—Fultz, Clawson and Lancaster. Oat acreage an average one; prospect good. Barley little grown. Rye acreage decreased; outlook poor. Corn acreage slightly increased; some complaints of defective seed: prospect fair; stand good. Apples and pears look fair; peaches and small fruits poor, with the single exception of grapes, which have a fine outlook. T. S.

CLARENDON, Calhoun Co.—The wheat crop will be not more than from one-half to two-thirds of an average; while east, west, north and south of us it will not be over from a quarter to half a crop. Oats are dried up. Corn we have had to replant, but it is now thriving. Potatoes look well. J. P.

HUDSON, Lenawee Co.—Wheat will not be more than half a crop; many fields have been plowed up; acreage about the same as last year. Lancaster wheat we found the most hardy of all. Oats two-thirds of a crop. Of corn, if the rest of the season is favorable, we may get a fair crop. It was often slow to come up, but late rains are pushing it. O. R.

JEFFERSON, Hillsdale Co.—Wheat got a small start last Fall, froze up with snow and was winter-killed. We had no rain since the frost went out till the first of June and it was again damaged by drought and frost and in the adjoining county there will not be over a quarter crop. The acreage is about the same as last year—chiefly Clawson, Lancaster and Fultz. Oats are backward; acreage light. Corn backward and a poor stand; acreage about an average crop. No peaches. Small fruits scarce. I. D. L.

LEONI, Jackson Co.—This township raised last year 3,814 acres of wheat, which averaged about 20 bushels per acre. There is now on the ground about the same number of acres with a prospect of from six to eight bushels per acre. Clawson and Diehl are the leading varieties; quite an amount of the Fultz wheat was sown last Fall, but it is generally a failure. Corn in 1880, 1,676 acres; 113,000 bushels. In 1881, about the same number of acres have been planted but it is very backward. As corn did not generally come up and we had to replant, our prospects of a crop are much injured. Oats in 1880, 456 acres, yielding 14,790 bushels; about the same acreage, but it, too, is very backward, the Spring having been cold and dry. Very little barley or rye is raised in this town. Fruit of all kinds will be a very small crop. Hay will also be light, the cold, dry Spring having injured grass. Many fields will hardly pay for running the machine over them. J. C.

MOORE PARK, St. Joseph Co.—Since June began we have had plenty of rain, and corn and potatoes look well; the acreage of each is nearly double that of last year. The acreage of wheat was one-fourth more, yet it is said by good judges that there will not be more than seed and bread in this county; and adjoining counties are not much better. Chief varieties Clawson and Fultz. A good deal of wheat has been plowed up and sown to oats and rye, and some to beans. These promise to be fair crops. Hay very light. Young clover all killed. Peppermint nearly all killed, and roots so scarce that but little was planted. There is one-third more corn planted than last year and it promises well. Cherries, peaches and plums will be scarce here, and this being the "off" year for apples, they will not be a drug. Small fruits a medium crop. R. C. B.

MORENCI, Lenawee Co.—The acreage of wheat is not quite as large as last year; and there will not be more than one-quarter of a crop—Clawson and Fultz mostly. About the usual acreage of oats, but they are very much hurt by the drought. About an average acreage of corn, but it is very backward; a good deal of complaint about its not coming up. There will be a fair crop of apples and small fruits. Peaches few. C. C. W.

MUIR, Ionia Co.—The acreage of wheat is about the same as last year. The outlook is poor—has not been so poor in twenty years. Much has been plowed up and the land planted to corn or oats. Oats, acreage 20 per cent. more than last year, and looking well. Of barley there is but little raised and of rye none. Of wheat the Clawson is mostly sown. The prospect for corn is good and the acreage 15 per cent. larger than last season. Very many fields have been planted the second time, but the weather has been favorable the past few weeks and it is now coming on finely. The severe Winter has done a good deal of damage to the orchards. Apples will be about half a crop. Peaches very few, and small fruits about an average crop. Grapes are all or nearly all dead. Hay will be a large crop—the best I think for years. W. F. H.

OSHTEMO, Kalamazoo Co.—Wheat acreage a little less than last year; condition three-fourths less favorable—Clawson, Fultz and Lancaster, in the order named. Oats less acreage; condition one-half less. Corn prospect fair where planted from 6th to 12th of May, before the intense drought prevented germination of seed; not so good as last year; acreage about the same. Of apples—Greenings, Peck's Pleasant and Sweet Bough—there will be a fair crop, and but few of any other kind. Peaches, none; pears half a crop; strawberries a quarter of a crop; raspberries probably a full crop. T. P. D.

OSSEO, Hillsdale Co.—The acreage under wheat and oats in this country is about the same as last year; but the yield will be only about half an average—Diehl, Clawson, Fultz, Egyptian and Lancaster wheats. The area under corn is about the same as last year; much of it is not up yet. Apples, one-third of a crop; no peaches; few pears; ditto plums; a good outlook for small fruits. No rain to speak of for two months; so that timothy meadows dried up; wheat stopped growing; clover did ditto. Twenty-four hours ago rain began to fall and vegetation seems to have advanced more in the last 18 hours than in the previous 60 days. A. E.

ROCKFORD, Kent Co.—The acreage of wheat is about the average of the last three years; but the prospect of a crop is quite poor. A friend who has been traveling in this section says it will not average one-third of a crop—chiefly Clawson, with some Fultz, Lancaster and Gold Medal. Oats are quite small yet, but are looking better since the rain. The prospect for corn is not encouraging; it did not come up very well owing to the vitality of the seed having been injured; acreage about an average of the last three years. Small fruits are quite scarce with the exception of strawberries. The early varieties of apples blossomed full; but the fruit seems to be blasting and falling off; the late varieties did not blossom much. Last year there was a very heavy crop. J. D.

SOMERSET, Hillsdale Co.—The acreage of wheat in this section is about the same as last year. The outlook in the first part of Spring was favorable for two-thirds of a crop; but owing to extremely dry weather during the greater part of April and May we hardly expect over one-third of an average. Clawson and Fultz are the favorites. Oats and barley about average crops. The acreage of corn will be about the same as last year; the prospect is not as favorable, owing to dry weather more than half of the seeding had to be repeated. We are now having an over-abundance of rain, and should it continue, it will be as disastrous to our second planting as the dry weather was to the first. This is the "off" year for bearing orchards in this section, so we do not anticipate over one-half a crop of apples; no peaches, but an average of small fruits. W. F. N.

TITTABAWASSEE, Saginaw Co.—There were in May this year 2,425 acres of wheat in this township against 2,114 acres last year, with an average of 21.59 bushels per acre; but the outlook for wheat this year is very poor, much of it being plowed up leaving perhaps not over 2,000 acres. At the best estimate it cannot yield more than eight or ten bushels per acre. Most of it is Clawson. Oats look good; last year there were 1,085 acres in this township; this year there will be more. Of rye none is sown and but very little barley. The prospect for corn is poor; much of it had to be replanted and we have had very cool weather for the last week and light frosts at night. The number of acres last year was 782 with a slight increase this year. Grass very light: old meadows mostly killed out. The outlook for apples is quite good. I have not noticed any trees hurt by the severe cold last Winter. Grapes and cherries good. H B.

Iowa.

Bentonsport, Van Buren Co.—Winter wheat badly killed; acreage about the same as last year; no Spring wheat sown; Fultz and rust-proof varieties of Winter wheat chiefly grown. Oats are looking *very* well; acreage larger than last year. No barley. Rye very thin; did not stool out as it should have done. Prospect for corn good; acreage about the same as last year. Apples very few; peaches, none; pears pretty scarce; cherries, none; gooseberries, currants, raspberries, blackberries and grapes abundant. S. P. D.

BUSTI, Howard Co.—The acreage of wheat, barley and rye is from one-third to one-half less than last year; that of oats one-third more. Lost Nation, Sea Island and several bearded sorts of wheat are sown. All grain crops look well, but there are millions of chinch bugs. Three times as much flax has been sown as last year. Corn looks fine on double last year's acreage. Few apples raised; small fruits abundant. "H."

DOWS, Wright Co.—Acreage of wheat and oats about the same as last year; barley and rye are not grown in this neighborhood. On account of the lateness of the seeding, crops seem backward, but in other respects look well. Of wheat the Fife and Lost Nation are the favorite sorts, but Sea Island is being tried by a good many farmers. Corn is very backward and the prospect for it is not flattering, acreage perhaps 10 per cent. less than last year. There are but very few orchards in bearing in this vicinity, and these showed but few blossoms in the Spring. Currants and gooseberries abundant. F. S.

SPRINGVILLE, Linn Co.—No wheat is raised here. Oats good; barley little sown; rye an average crop. Early corn looks well; late looks bad; average poor; can't possibly be over two-thirds of last year's crop. Apples a light crop; currants and other small fruits good. C. P.

WINTHROP, Buchanan Co.—Wheat for the last three years having been an entire failure, partly on account of the chinch-bug, none has been sown. The oat crop looks well; acreage about the same as last year. But very little barley and rye sown, and the rye has been partly winter-killed. For corn the prospect is very poor at present, the Spring being so backward. Most of it was planted late in May. Acreage about the same as last year. Currants and raspberries quite plentiful. Apples scarce. G. E.

Wisconsin.

ARGYLE, La Fayette Co.—Winter wheat badly winter-killed; Spring wheat looks good. Mostly "Tullabary." Prospects for corn good—very late. Small fruits a heavy crop, but the apple crop will be light. T. H. D.

CLINTON, Rock Co.—Scarcely any wheat is sown by itself hereabouts. We usually sow wheat and oats mixed, under the name of sucitash (succotash?). It looks well. What Winter wheat was sown was all killed out. Oats and barley have an average acreage and look well. What little rye is sown looks well. Only a little more corn than usual is planted on account of the late Spring. It is all up, but it is too early to prophesy about it. The fruit crop will be very light; the trees bore heavily last year, and there were scarcely any blossoms this year. Currant worms busy among the currants and gooseberries. J. C. B.

DE PERE, Brown Co.—There is less wheat sown than usual—Fife and White Russian Spring; chinch bugs are hurting it quite badly. Of barley more has been sown than usual, but the prospect is poor. Oats about as many as usual, but the prospect first-rate. Fruit is not much raised here, and it is the "off" year. Grass is the best for years. H. P. C.

FREEDOM, Outagamie Co.—The acreage in wheat is less than last year; the outlook for Winter wheat, bad; for Spring wheat, good. Oats, an increased acreage; outlook good. Barley increased acreage; outlook extra good. Rye, acreage small; outlook poor. Fife wheat and White oats. Corn has an increased acreage; prospect as good as usual at this time; some are planting over on account of poor seed. Fruit prospect bad. Many trees which bore heavily last year are dead. The early apples, as Duchess of Oldenberg, Red Astrachan, Sops of Wine, St. Lawrence, are all well set with fruit and promise a fair crop, and so do the crab apples. There will be but very little Winter fruit. Strawberries came through the Winter all right and promise well. The Black-cap and Philadelphia Raspberries came out all right and promise a full crop as usual. We shall have a good crop of hay. All kinds of stock are looking well; and prices are satisfactory to sellers—cows from $30 to $45. Farmers are going out of wheat and into stock. E. N.

GARDEN VALLEY, Jackson Co.—The wheat area is one-quarter less than last year; that of oats is greater. Of rye not much is raised. Of corn one-third more has been planted than last year. The prospect for crops is good so far. Fruit will be half a crop—trees badly frozen last Winter; one-quarter killed by the cold weather. G. S.

Montello, Marquette Co.—Good outlook for a better yield of wheat and rye than last year; Winter wheat badly injured; Fife and Rio Grande are the varieties chiefly sown. Corn promises a full average crop. Orchard and small fruits, except, perhaps, strawberries, will be much below an average. C S. K.

REEDSBURG, Sauk Co.—Winter wheat looks well; not much Spring wheat sown this season. Oats and barley promise fairly. Corn and potatoes are just being planted. Hops are not looking very well; most yards were injured in the Fall. In '78 Reedsburg was the hop center of Sauk Co., every farmer having from five to forty acres devoted to hop culture; now Sauk makes no pretensions, and many men have quitted the business altogether. Much attention is being paid to dairying and the raising of cattle, sheep and swine, which does not involve the same risks. G. P. S.

WINDSOR, Dane Co.—Oats look fine; acreage about the same as last year. Barley looks well; acreage larger. Rye winter-killed mostly. Wheat acreage very small. Corn looks well but a great deal of it was planted very late; acreage about the same as last year. Fruit prospect very poor. S. D. B, M.

Minnesota.

HAWLEY, Clay Co.—The acreage of wheat is about one-third more than last year; a good stand, but late—mostly Scotch Fife and Norwegian. Oats grown only for home consumption. Barley not much grown, but yields well. Very little corn is raised here. The country is too new to know what can be done with orchard and small fruits. C. S. D.

MYRNA, Blue Earth Co.—Wheat is king here, occupying most of the arable land, with about one-tenth of it to oats and one-fifth to corn, and a small percentage to barley. The prospect for corn is not good on account of poor seed. About twice as much ground was planted to corn as last year; but very little of it came up, and the ground was sown to flax. What corn is up looks splendid. Orchard and small fruits scarce. J. W. H.

PINE ISLAND, Goodhue Co.—The acreage of wheat is 25 per cent less than last year; that of oats, 10 per cent more. Small grains are looking bad on account of chinch bugs and the May drought. Some are sowing salt on wheat at the rate of 150 pounds per acre as a preventive of bugs. Scotch Fife and White Russian are the chief varieties; Fife being ahead. Corn is getting to be the staple grain crop here; the acreage has been increased 20 per cent this year; it looks fine. Although, owing to the late Spring, it was not generally planted until between May 10 and 15, it has made an excellent growth. "A SUBSCRIBER"

PLAINVIEW, Wabasha Co.—Area of wheat much less than last year; that of barley somewhat larger. No change in acreage of oats. The prolonged drought in May injured all these crops. Fife, White Russian and Brook's are the chief varieties of wheat. There's a large increase in the acreage of corn, and it looks well. Many apple trees were winter-killed. No cherries or tame plums will live here. Small fruits good, except raspberries. B. C.

RICE'S, Benton Co.—Wheat acreage 30 per cent. larger than last year. Prospect for all kinds of small grains, never better. Principal variety of wheat sown hard Scotch Fife and some White Fife. No corn or small fruit raised. H. O.

Missouri.

BUTLER, Bates Co.—Acreage of wheat and oats large and prospect average; late wheat injured by chinch bugs—Fultz and Mediterranean. The present prospect for corn is excellent; acreage one-third above last year's. Apples a fair crop; peaches mostly killed—a light crop; blackberries, none; raspberries and strawberries abundant. E. P. H.

JEFFERSON CITY, Cole Co.—Wheat increased acreage 25 per cent; prospect for yield only 75 per cent., owing to chinch bugs, Hessian fly and dry weather. Varieties, Clawson, Fultz, Red Chaff, Tappahannock. Oats average acreage and prospect. Rye has half last year's acreage and an average yield per acre. The prospect for corn is fair, the acreage 80 per cent. of last year's area. Potatoes, prospect good. Apples, one-quarter of a crop; pears, three-fourths; peaches, none but seedlings; small fruits abundant. A month ago there was

a prospect of 50 per cent. increase in the hay crop; now the outlook scarcely promises an average crop. L. V. D.

Kingston Furnace, Washington Co.—Wheat acreage about the same as last year; outlook mixed—some fields plowed under; some good, but many badly affected by cold Winter and and Spring drought—mostly Fultz, Red Zimmerman, Early May and Tappahannock. Oat acreage small; outlook good. No barley or rye. Corn spotty; some good, but a bad stand in many cases and late planting; acreage somewhat increased. No peaches; some apples and cherries. Strawberries a good crop; prospect good for dewberries, black and blueberries. N. W. B.

PLEASANT MOUNT, Miller Co.—Chinch bugs have damaged wheat so that in most places there will hardly be half a crop. Some fields have escaped entirely, but these cases are very rare. A good many pieces will not pay for cutting. Corn, too, is likely to suffer severely from these pests. Oats are damaged by dry weather, the days being very warm so that they make no growth at all; in fact, unless the weather is unusually favorable they will not grow high enough to be cut with a reaper and bound up, but will have to be mowed. Corn is looking very well. Farmers were as a rule very late in getting in their corn, many not having got through until the first of June, and some then quitting because it was so late. Quite a large acreage was planted. Wheat is headed out and harvest will begin about June 17. N. J. S.

SEDALIA, Pettis Co.—The acreage of wheat is from 10 to 20 per cent. more than last year, but the outlook is that it will not make more than half a crop—Fultz, May and Red Winter. Only a small area of oats sown; but it looks well. An increase of 15 per cent. of acreage under corn, which looks fine. Apples promise an average crop. Not many small fruits. J. J. Y.

TORONTO, Camden Co.—The outlook for crops is bad. Acreage for wheat is larger than last year. Oats, two-thirds crop. Rye good. Corn poor. Prospect for orchard fruit good. Small fruits a total failure. W. T. T.

VANDALIA, Audrain Co.—The acreage to wheat in this section last Fall was unusually large; but, owing to late Spring freezing, dry weather, and chinch bugs, the crop promises to be nearly (if not quite) a total failure. About the usual acreage of oats last Spring, but for reasons given above the crop will be short. Very little rye raised in this section and no barley. The varieties of wheat chiefly sown here are Fultz, New York Premium and Democrat. Fultz was sown more extensively last Fall than any other sort. More acres to corn here this season than last. Cutworms have done much damage in some localities; but the crop generally is coming on finely and the prospect is favorable. Orchard products and small fruit crops will be light. R. R. B.

Kansas.

MANHATTAN, Riley Co.—Acreage of wheat is small, owing to a large amount being plowed up in the Spring; that standing is looking much better than last year at this time. Oats about the same amount sown as last year and never looked better. Rye—none sown of any account. Corn looks well; acreage somewhat larger than last year, the increase being caused chiefly by the wheat being plowed up. Orchards promise better than the average, except peaches. Small fruits abundant. J. G.

NEWTON, Harvey Co.—The acreage under wheat is larger than last year and the yield will be double as much—Turkey, Fultz and Early May. Early-planted corn looks well; but a good deal of it was planted late owing to wet weather. Abundant rains are now helping all growing crops. Not much barley or oats is raised here. Potatoes look better than at this time during the past ten years. Apples, peaches, gooseberries and strawberries are plentiful. S. C. G.

SOLOMON RAPIDS, Mitchell Co.—All kinds of grain, potatoes and garden truck look first-rate; about the usual number of acres sown and planted. Corn looks well, with at least one-third more acreage. It has had all the rain needed, and though it is rather weedy the prospect is good for a large crop. Y. D.

WALNUT, Crawford Co.—The acreage of wheat somewhat larger than last year. Some fields that were sown early and thick are looking very nice and will probably yield from 16 to 20 bushels the acre; while many others that were sown late stand thin on the ground and will be failures. Some fields have been plowed up and sown to flax or planted with corn. The hard Winter and chinch bugs are the chief trouble here with the wheat, although the Hessian fly is doing some damage. Fultz, Clawson and Mediterranean are the chief varieties. Wheat will not average more than half a crop. The acreage of corn is about the same as last year; but on account of the early and severe Winter, but few farmers had their corn hucked in time for early planting this Spring. Through the month of May we had such an excessive amount of rain that the corn fields looked like a meadow, and an implement to the use of which the farmers of this section are constitutionally opposed (the hoe) was from necessity brought into use. Since June 1st the weather has been warm and dry, the ground is in good condition to work and the two-horse cultivator is clearing the fields of weeds and crab grass, the latter a more persistent foe than the former. At present the outlook is good for a large yield of corn. The prospects are much better now for apples, peaches, cherries, etc. than they were four weeks ago. In some localities the blackberry and raspberry canes were killed to the ground; while those that were protected are all right. Grapes are now doing well. We shall probably have large and small fruits enough for home consumption, but none to spare. B. G.

WASHINGTON, Washington Co.—Winter wheat mostly winter-killed except Soule; all much damaged; acreage sown 75 per cent. of last year's area; outlook poor. Rye sown only for pasture and for seed; looks well. No barley. Oats in good condition; 100 per cent. more sown than for the past few years. Spring wheat in good condition; acreage 90 per cent. of last year's area; outlook good for a fine crop. Cherokee or Grass wheat the principal Spring variety. Corn, acreage 50 per cent. larger than last year; prospect excellent, although some failed to get a good stand at first planting on account of wet weather; this was replanted. Weather very favorable now; everything growing and about up with the usual season, although we had a late, wet Spring. Fruit outlook excellent except for peaches. Small fruits never better. P. L. L.

WASHINGTON, Washington Co.—The wheat acreage is about the same as last year; outlook good. Oats not quite so good. Barley acreage less; prospect an average one. Rye 50 per cent. increase in acreage; crop very good. For wheat we sow Red Chaff and White Michigan for Fall; for Spring, White Russian and Cherokee or Grass. Prospect for corn not quite so good as last year, owing to late planting; acreage one-third more owing to wheat killing out, but if the season remains good we shall have more corn than last year. For orchard fruit, except peaches, the outlook is extra-good; the same for small fruits. C. W.

Nebraska.

FREMONT, Dodge Co.—Wheat, oats and rye look *very* good; acreage of each about the same as last year. Very little barley grown; all Spring wheat and Winter rye. The prospect for corn is very good, although a little late, and the acreage will not be more than two-thirds of that of last year, because so much of the low land on river bottoms has been overflowed, so that it could not be planted. Our orchards are young and few, and both orchard and small fruits will be light, being killed by hot, steamy weather while in blossom. T. R. G.

WEST POINT, Cuming Co.—Wheat acreage the same as last year's; looks a little better, but is a little later—mostly Mediterranean and Pearl; very little Lost Nation. Oats, seed not good; acreage about same as last year's; looks good. Barley not much sown; looks good, what there is of it. Rye good; well headed out. Corn planted very late; seed very poor; most farmers have had to replant, and it is not a first-rate stand now; prospect not flattering; two-year-old corn made the best seed; acreage a little less than last year's, because land could not be made ready in time. Orchards hurt by hail; otherwise prospects very good; young trees have plenty of fruit. Small and wild fruits good. A. R.

Canada.

ONT., Perth Co.—Fall wheat will not be over half a crop, being badly killed out by dry weather in Spring. Spring crops look well. Meadows look better than usual, although a sharp frost in the beginning of June, has, it is feared, injured the clover. Apples will be only a moderate crop; last year was the bearing year. Cherry and plum trees suffered much from the severe Winter, and both will be short crops; but strawberries, raspberries, gooseberries, and currants promise to be abundant. The potato bug is more abundant than ever; still there has been quite an average breadth planted. A. J. C.

MILTON, Ont.—Fall wheat about an average acreage: some fields very good, but we shall have only a little over an average crop. Clawson and Fultz; very little Spring wheat raised. Barley and oats look well; they are likely to be above an average. Corn is not raised here to any extent. Soil not adapted to it. Apples will be an average crop, although not so plentiful by one-half as last year. Strawberries good; large amounts are raised along the lake shore for shipment. Peaches are not raised here for shipping, nor any other small fruits. Hay will be rather below an average as injured last Summer. E. D.

LATEST CROP REPORTS.

EASTERN STATES.

Maine.

CHESTERVILLE, Franklin Co.—More wheat than usual sown—Lost Nation almost entirely. More corn and fewer potatoes have been planted; both are in fair condition. Apples promising. Grass excellent; a fine hay crop nearly certain. P. N.

Topsham, Sagadahoc Co.—The acreage of oats, barley and rye is about as usual; that of wheat is less, but the outlook for all is a fair average. The prospect for corn is poor; the acreage small. The outlook for orchard and small fruit is good. T. J. W.

New Hampshire.

THORNTON'S FERRY, Hillsborough Co.—Wheat and barley are not raised in this section to any amount. Of oats there has been a larger area sown than last year, and rye (which is mostly Winter rye) is looking very fine, and has probably about the same acreage as last year. Owing to the cold, wet weather, corn was not planted till a week later than usual, and it is now quite small; but if the remainder of the season should be favorable there may be a fine crop, as a much larger acreage has been planted than usual. A large area of potatoes has been planted as much or more than last year. Apples and pears bloomed very full. Peaches are very much injured by the severe weather of last Winter. Small fruits will probably be quite plentiful. I never saw grass look better, and we shall probably have a larger crop of hay than we have had for years. A. M'C. W.

Vermont.

So. Wallingford, Rutland Co.—The outlook for small grains is favorable, of these oats are our chief crop. Corn is not as large as last year; but it looks fine and thrifty "for its size." There will most likely be plenty of apples and small fruits, though not as much as last year. C. S.

STRAFFORD, Orange Co.—Farmers in this section will average about one and a half acre of wheat and one of oats. No other kind of small grain is sown to speak of. Wheat, White Russian and Lost Nation. The prospect for corn is good; the acreage is the same as last year. The outlook for orchard and small fruits is good. L. P. H.

WEST CHARLESTON, Orleans Co.—The acreage of wheat, oats and barley is about the same as last year, and all look well. Lost Nation wheat takes the lead, though some White Russian and the old varieties are also sown. A large acreage of potatoes—Early Rose, Burbank's Prolific, Snowflakes and Sunrise, besides some other varieties, are raised. Corn area less than usual. A heavy frost on June 6 killed corn and potatoes to the ground. Fruit prospect good. C. F. W.

WEST RUTLAND, Rutland Co.—But little wheat, barley or rye is raised in this section; what there is looks well. Oats are raised by nearly every farmer, and they look better than usual. The acreage in corn is about the same as last year; it is rather small, and frosts have damaged some pieces. The prospect for orchard and small fruits is about medium. W. C.

WHITING, Addison Co.—The farmers in this valley of Otter Creek are beginning to complain of our present cold and dry weather; still, with the exception of grass, crops are looking fine, especially small grains. There was a larger breadth of oats sown this Spring than usual. Wheat is not very extensively raised—the Snowflake and Lost Nation are the most promising varieties. Very little rye or barley. A larger acreage of corn than usual. Owing to the late cold weather it looks rather sickly. Judging from the small yellow spots on our potato leaves Paris-green will soon be in demand. The outlook for orchard and small fruits is favorable for a large crop. C. W. K.

Massachusetts.

Amherst, Hampshire Co.—Oats and rye never looked better at this season. A better hay crop in prospect than for several years. Acreage of corn is about the same as last year, but it is backward; same may be said of potatoes; beetles very abundant. Apples promise an unusually good crop. Prospect for pears is good. Peaches promise a fair crop. Grapes will be a very heavy crop. Strawberries just beginning to ripen and will probably be a large crop. Prospect for other small fruits good. L. W. G.

CHICOPEE FALLS, Hampden Co.—No wheat or barley raised here. Very little oats are grown for grain; but some are raised for fodder; appearance good, considering the cold and wet we've had. Rye looks first rate—better than last year on an increased acreage. Corn planting has been delayed till the middle of June by wet and cold weather—the usual acreage, however, will probably be put in. Peaches a failure; apples scarce in this our "odd" year; pears and plums good crops; not many cherries; but berries will be abundant. E. W. C.

GREENFIELD, Franklin Co,—But little rye; looks fine. No wheat or barley is grown here. Oats on land that had been planted twice look well; those on last year's sod are "worked" by worms—mostly Probstetar and Surprise; from one to three acres are raised by each farmer. Corn backward on account of rain, cold and frost; as much planted as last year. Potatoes are looking well; bugs plentiful. Small fruits blossomed freely; so did apples, peaches, pears, etc. The hay crop promises to be large; worth now $15 per ton. A. W. H.

SUNBORN, Middlesex Co.—No wheat; oats raised chiefly for fodder; looking well. Small acreage of barley and rye: say 25 acres of barley and 50 acres of rye to 1,000 people; outlook favorable. A larger acreage of corn than has been planted for three years past: looking poorly and yellow on account of continued rains. "Off" year for apples in this section. Bearing year for pears which are looking well. Strawberries and raspberries good; blackberries only fair. A. H. B.

Connecticut.

CANTERBURY, Windham Co.—No wheat or barley. Oats and rye looking well. Prospect for corn is promising; acreage about the same as in former years. For orchard and small fruits the prospect has never been so good. C. W. G.

Clinton, Middlesex Co.—The area of rye in this section, comprising four towns, is not far from 800 acres. Very few oats raised. No barley. Rye promises well. About the same quantity of corn planted as last year. Apples bloomed very full for the "off" year; a large yield of small fruits is probable. W. A. D.

Groton, New London Co.—No wheat. Rye looks well and will yield about 12 to 14 bushels to the acre. Oats are looking fine—never better, and will yield from 25 to 50 bushels pear acre. Rye will be 15 per cent. better than last year. Corn is backward. Potatoes are looking very fine. The hay crop will be heavy—about 25 per cent. better than last year. Orchard prospects are very good, especially for pears. Blackberries were badly winter-killed; raspberries are looking well. E. A. H.

MIDDLETOWN, Middlesex Co.—We are having plenty of rain here now and crops of all kinds are looking well. Wheat and rye are splendid. Oats ditto. Barley is not much grown. The prospect of a fine hay crop never was better. Potatoes are looking fine. Corn is rather backward, owing to the late Spring and wet weather. There will be a larger acreage of tobacco this year than ever before. Apples a fair crop; small fruits abundant. S. W. P.

WEST REDDING, Fairfield Co.—No wheat in this section. Oats are looking exceedingly well. Rye is very heavy and promises an unusually large yield. Tobacco is the main crop with farmers here. Corn is late and rather small for the season; the acreage is about the same as last year. Grass very heavy. Orchards are well set with fruit. Small fruit injured by wet. S. G.

MIDDLE STATES.

New York.

ALBANY, Albany Co.—Not more than half as many acres under wheat as there were last year; prospect middling. Of rye there is probably one-third more, and it is looking good. No barley. Corn about the same as usual in area and outlook. But few apples. Potatoes promise a good average yield. L. J. G.

ALDEN, Erie Co.—Fall wheat acreage up to average; present prospect equal to last year's—mostly Fultz and Clawson. Oats and barley were sown late; acreage under that of last year; varieties: barley, mainly four-rowed; oats, everything known in the market. Indications for above-mentioned crops, favorable. Corn planted late; acreage an average; growth small. Fruits of all kinds promise well. J. M. C.

Arcade, Wyoming Co.—Wheat an average crop—Clawson. Oats, rye and barley, usual acreage; never better—White Russian Oats. Corn acreage same as last year; stand poor—too wet. Orchard and small fruit outlook very favorable. This is a dairy section. Corn doing finely; grass never better; meadows above the average. No insect pests to amount to anything. Season ten days *earlier* than usual. P. H. P.

Auburn, Cayuga Co.—Winter wheat will be a fair crop, if insects do not take it; acreage as large as in 1879—Clawson, Treadwell and ordinary red and white. Oats and barley have a middling outlook and an acreage as large as in 1880. Corn area as large as last year's; it hasn't come up well and is backward. C. E. H.

BUSTI, Chautauqua Co.—Acreage of oats is a little above the average; they are looking well. Barley and rye not sown to any extent. Corn is not coming up well; acreage about an average. Winter wheat looks well and more was sown than usual. No Spring wheat. Prospect for fruit of all kinds good, except for peaches. J. D. F.

CAYUTA, Schuyler Co.—Wheat and oats acreage about the same as last year; both are looking about medium. Very little barley or rye sown. The prospect for corn is not very good; much has rotted in the ground; about the same acreage as last year. Orchards promise an abundant crop. All small fruits promise well. The Cuthbert raspberry bushes you sent us last year are growing splendidly with some fruit on. W. J. R.

CLIFTON PARK, Saratoga Co.—The acreage of wheat hereabouts is about a quarter less than last year, and the outlook poorer for a good yield per acre—Clawson mostly. About last year's area of oats; prospect good. A quarter more rye; and a ten-per-cent. better prospect. Corn is small but well started; acreage the same as last year. Apples will be a light crop; small fruits an average one; berries abundant. P. J. S.

Clymer, Chautauqua Co.—Not over one-half of the farmers sow any wheat, the rest would probably average about two acres per farm—Clawson; prospect good for an average crop. Oats probably about six acres per farm—White Shoshone; prospect good for a very fine crop. No barley or rye enough to speak of. Corn rather backward; about the usual acreage. Small fruit prospect good. This being the bearing year with us, we expect a large crop of apples and there is every prospect of it. J. M. G.

Coxsackie Greene Co.—We have had a heavy fall of rain and all crops are looking good; acreage of wheat small; White Winter looks good. Oats, medium quantity sown. Rye acreage large; appearance good. Corn acreage larger than usual; small—too wet and cold. Apples short. No peaches. Pears, plums and small fruits plentiful. S. S.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, JUNE 25, 1881.

We are now preparing our Special Wheat Number, and we again solicit our readers to contribute any items in their observations or experience, which may seem of general interest.

Sowing Timothy in the Spring.—Our farmers seem to be more in favor of sowing Timothy as well as clover in the Spring on wheat, instead of with wheat in the Fall. By this change wheat acquires a stronger growth in the Fall and is in better shape to stand the Winter. Wheat is often injured on our farm by Timothy sown in the Fall. We are confident of it, for the experiment of Timothy and no Timothy upon the same field has been tried. Timothy is to wheat a weed as much as dock, radish or sorrel, and robs it of needed nutriment in the same way. When Timothy is sown in the Spring, the Timothy is crowded and its growth retarded, while the wheat is benefited proportionately.

When Indian corn comes up yellow and feeble—when many plants, as in the present season, die owing to cold, cloudy, rainy weather, does it ever fully recover? That is, does it yield as much under subsequent favorable conditions as it would have, had it come up green and vigorous? We do not know. We have been told by farmers older and more experienced than ourselves that it makes no difference—in other words, that it may wholly recover from its feebleness in its early age. Dr. Hexamer suggested to us a few days ago that we plow up a part of our main field and plant again. In any case the experiment would have proven instructive. We could not act upon the suggestion, however, for the reason that our seed had all been planted and we care not to cross our corn with other seed that has been less carefully selected.

Excepting only one year, the present has been the most favorable for the hay crop of any we have ever known at the Rural Farm. A good hay season is always a good oat season and a bad one for corn. Many corn plants have perished for want of sun and heat so that the stand is twenty-five per cent. less than last year, while the second planting has not proven to be worth the cost of making it. Add to this that our main crop, planted upon poor land without manure, is of late kinds, which require a long and favorable season to ripen, and it will appear that the Rural Farm corn crop promises to bear a striking contrast with that of last year. But our wheat is looking better than ever before and we look for a heavy yield. What we have said as to the Rural Farm may also be said as to Long Island in general. An immense hay, wheat, oats, and we may add, potato crop and a small crop of Indian corn.

Tidiness About the Homestead.—There is an old story to the effect that once upon a time there was a man in search of a housekeeper, and as applicants for the position arrived he arranged matters so that each one, as she entered, found a broom lying on the floor in her way. All the women but one stepped *over* the broom and passed serenely on. The one woman who stooped and picked it up secured the place of housekeeper solely from that fact. It was her only recommendation; but her employer argued from that, that the woman was observant and orderly—two qualifications that he highly appreciated. Whenever you walk over sticks and brush and rubbish in your yard, that disfigure its tidy appearance, instead of picking them up, remember that you are "stepping *over* the broom," and somebody will pass judgment upon you, by what you may be pleased to call very insignificant indices. But the judgment in most cases will be quite correct. If every man, woman and child about the premises were trained to pick up and remove from view all rubbish and litter that he or she comes upon in walking about a yard or lawn, there would always be an appearance of neatness and tidiness preserved at little cost or trouble.

Boston's Enterprise.—Enterprise in any just cause is worthy of honor, especially if it involves national interests, so we say "Success to the Boston Exhibition." But two things are necessary to complete success in the World's Fair business, first, the city in which it is to be located should be all enthusiasm for the project, and, second, the public at large should realize that such an undertaking will be a good thing, for the industrial interests of the country, especially. It won't do for the masses to become impressed with the idea that the exhibition is being run in the interests of any corporation or union of corporations. It must be cosmopolitan. Philadelphia did nobly for the Centennial—that foretold success; the country responded enthusiastically—that insured success. The lately deceased "proposed" World's Fair of this city illustrated the other side of the question. The city failed to do its duty—failure was probable; the country "would no more of it"—failure was certain. Now Boston has the "fever"! Every citizen of the "Hub" must catch it! Their enthusiasm must inspire the great public at large to render assistance; then we may safely invite our foreign friends to come and see us, but not till then.

WORK

And now comes the preparation for harvest. Happy is he who has all needed implements in good order; for he not only enjoys the satisfaction of swift and thorough work, but the profit resulting from making the most of time and labor. It is better to cut grass and clover a little too early than a little too late, especially where, as about the Rural Farm, they are in many fields badly lodged.

Beans, cucumbers, sweet corn and peas may still be planted for succession, though the last-named rarely do well when planted so late. Celery for early use may now be planted out. Spinach may now be sown for early Fall use. Beets and mangels may be planted for stock up to July 10, as well as beets for late Winter. Winter cabbages should soon be planted.

THE N. Y. HORTICULTURAL SOCIETY.

The above-named society, which meets monthly in this city, is doing a commendable work in promoting the interests of horticulture. Florists and horticulturists, both professional and amateur, vie with each other in the exhibition of fruits and flowers, and the natural result is an elegant display of rich and rare varieties for the mutual enjoyment and profit of those who attend. The orchids and rhododendrons at the recent June exhibition were most attractive, though the display in elegant table designs, in cut flowers in vases, and in baskets and bouquets of almost endless variety was highly commendable. The exhibition of strawberries was, perhaps, the chief attraction owing to the great variety and extraordinary size of the fruit. The new variety called the Bidwell received much attention from those interested in the "coming strawberry," and it appears worthy of all the commendation it is receiving. While we have no word of criticism to offer, we shall, with our friends of the society, hail the day when the size of the exhibition hall may be somewhat commensurate with the needs of the thousands of florists and amateurs who in and about this great city should interest themselves in its progress.

CHARLOCK AND WILD RADISH.

Of all the weeds which infest the Rural Farm, Charlock (Brassica sinapistrum) and Wild Radish (Raphanus raphanistrum) are by far the worst. We have trustworthy evidence that land seeded with these pests will produce them for twenty years though every plant that blooms may be pulled up before it forms seeds. We have known farmers to have them cut with the scythe while in blossom, ignorant of the fact that every plant so topped would send out laterals from every joint left, each one of which would bear as many flowers as the entire plant if left to itself. For this reason it should be borne in mind that in pulling up the plants the work should not be intrusted to careless hands who are indifferent whether they break off the stems or pull them up by the roots. Such labor is not only thrown away, but, as we have said, the cut plants will bloom many times more profusely than before. Field Mustard and Wild Radish have so taken possession of many farms on Long Island that oats are never sown. It seems to us quite inexplicable that after lying dormant in the soil for years through grass and corn, the seeds germinate so freely when oats are sown, to disappear again oftentimes when wheat is sown, and not again to appear until the next seeding to oats. It seems that the only way to rid one's land of these weeds is by persistent hand pulling—the work of a lifetime, when once the land becomes foul. Both plants are annuals so that they are spread only by seed from year to year.

OUTLOOK FOR CROPS.

The value of agricultural reports depends mainly upon their candor, trustworthiness and completeness. No one can read the large number of reports in this issue without being strongly impressed by their excellence in these respects. They are taken from about 2,000 reports, all of which our limits will not permit us to print. In making the selection our only guide has been the desire to represent fairly all sections of the country. All, however, have been carefully analyzed and in coming to the conclusions herein stated all have had due weight. Nor have a very large number of other sources of information been disregarded; but these have held merely a secondary place in our estimation, as our own reports are at once the latest, the most widespread and the most detailed. They all come from intelligent farmers well acquainted with the agricultural prospects and conditions of their respective sections; and to these our sincere thanks are hereby returned for the painstaking attention which they have given to their reports.

Although corn is by far the most important crop we raise, yet, like cotton at the South, wheat throughout the North attracts most attention as the great money crop. Judging from the present multitude of reports, as well as from those that have been published every week in our columns, and from a discriminating selection and careful study of a large number of other reports made either by the Agricultural Department, State Boards of Agriculture or enterprising journals, we cannot avoid the conclusion that the wheat crop of 1881 will be at least 20 per cent. below that of 1880. The latter has been estimated by the Agricultural Department at 480,849,723 bushels, so that, on this basis, this year's aggregate crop can hardly be far from the neighborhood of 380,000,000 bushels. For reasons heretofore given, however, we are strongly impressed with the opinion that the Department's estimate was at least fifteen or twenty millions of bushels too high; and should this opinion prove correct, a corresponding reduction should be made from the above estimate of this year's total yield.

Winter wheat has suffered far more severely than Spring, and of the vast territory in which this sort is raised, Michigan, Indiana, Illinois, and, probably, Kentucky, with parts of northern Missouri and southern Iowa and Wisconsin, have been the heaviest losers. Spring wheat appears to be as thrifty as last year, but, owing to the lateness of the season and the floods on bottom lands in the Spring wheat region, the acreage is somewhat less than last year's, except in Northern Minnesota and the Red River country, in which a greatly enlarged acreage has been put in, with highly promising results. The harvesting of Winter grain has already advanced as far north as southern Kansas, Missouri, Illinois, Indiana and Ohio, so that the recent rains will have come too late to benefit the fall-sown grain. Farther north, however, they will doubtless be of considerable advantage. The total acreage under wheat this year is probably somewhat less than last year, as the increase in the newly-settled States and Territories is more than counterbalanced by the decrease in the older States. Our reports from the Pacific Coast have not yet reached us, but, according to local papers, the acreage under wheat is considerably smaller than last year, especially in the middle and northern districts, and the yield per acre is likely to be less. The character of the reports, however, seems to depend not a little on the quantity of grain still in the hands of the farmers in various places, the gloomiest forebodings coming from localities where most of last year's crop is still on hand. The Oregon wheat crop, it is reported, will turn out a fair average.

Oats are reported to be an unusually fine crop in all parts of the country, and with hay will probably be cheap next Winter. Two years ago the total crop was 407,970,712—about 50,000,000 bushels less than the aggregate wheat crop. This year the crop of oats will, most likely, exceed that of wheat. Of the 44,149,479 bushels of barley produced in 1879, the census returns assign 12,578,486 bushels to California, 2,480,400 to Iowa and very nearly 7,788,749 to New York. The remainder of the crop was grown then, as it is this year, in small quantities in the various States and Territories. The same remark is equally applicable to rye, of which an aggregate of only 19,863,630 bushels was raised in '79, a quantity to which Pennsylvania contributed 3,683,621, Illinois, 3,121,689, and New York, 2,634,390 bushels, leaving only a mere trifle to each of the other States and Territories. Both crops appear to have a full average acreage this year and to promise an average yield.

Corn, which far transcends in importance and aggregate yield all other cereals together, will be a comparatively poor crop this year, unless favorable weather until harvest shall belie present indications. While the acreage is larger than last year, on account of the settlement of fresh districts on the border, and because not a little of the plowed-up Winter wheat land was planted with corn, the stand is in most places reported poorer and the crop is nearly everywhere very backward. According to the Department of Agriculture, the total yield last year was 1,537,535,000 bushels, from which a deduction of fifteen per cent. would leave 1,308,535,000 bushels as the aggregate of this year's crop. Inasmuch as the corn crop is generally made in July and August, however, there is still time for a great deal of improvement.

Potatoes are generally reported a fair crop on a slightly increased acreage; but as the Colorado pests are extraordinarily numerous, the late sorts have still a perilous time before them. Grass, the king of all crops, is flourishing right royally this year. Cotton, the deposed monarch, has extended his territory about two per cent. according to the latest and most reliable accounts. The stand is a good average generally, and enough labor is easily obtainable except in Texas and Southern Arkansas where the extraordinary amount of railroad construction affords more remunerative employment. Tobacco culture has nearly doubled in the decade between the census of '80 and that of '70 and the increase is continued the present year. The average yield per acre varies wonderfully, Massachusetts averaging 1,692 pounds per acre; Connecticut, 1,635; Kentucky, 755; Virginia, 536; Mississippi, 282, and Georgia, 219. Plenty of room for growing larger crops in most places where the weed is grown! The prospect before the lovers of fruit is of moderate cheer. Apples will be fairly abundant for an "off" year. Of pears there will be about enough to make their cultivation pleasantly profitable. Peach lovers will have to pay pretty high for their favorites which have met with almost universal disaster, or content themselves with grapes and small fruits, cheap from their abundance.

BREVITIES.

How is your type-writer working now-a-days, Oh! J?

When a man who has spent a heartless, money-grabbing, self-absorbed life once gets a push down hill, it is no easy matter to stop. And those who know him will smile at his vain struggles.

The continued wet weather seems to be destroying the eggs of the Colorado potato beetle at the Rural Farm.

Cultivate the corn. Do not wait for weeds to appear. The stirring and change, so to speak, of soil is as important as the destruction of weeds.

We are pleased to learn that the Japan Maples in the garden of Mr. James Hogg (Yorkville) have not been injured by the past Winter. We should like to hear how they have stood in Flushing and other places.

One of our temporary hands who was born and bred just opposite to the Rural Farm said to us a few days since, referring to our main corn field: "That field is as poor as a beach. Did you expect to get a good yield of corn without manure?"

Christmas trees, or dead evergreens of most sorts, of medium size, particularly cedars, make sightly and excellent trellises for vines, useful or ornamental. Trim off the branches to within a foot or so of the body, and plant the "tree" deep enough to receive complete firmness and solidity.

Two more of our successful mangel raisers write us as follows concerning the gifts we sent them:

Eds. Rural:—
Accept thanks for the Aquapult received to-day per American Express. May your shadow never grow less! Yours truly,
Mt. Pleasant, Ont. James Grace.

Eds. Rural:—
Accept many thanks for the Keystone Washer. My wife tried it to-day and says it works first-rate. She had tried several others and pronounced them failures, but the Keystone does the washing well and easily.
Very truly, yours, Wm. Moore.
Camden, O.

LATEST CROP REPORTS.

Continued from page 423.

DUNDEE, Yates Co.—Wheat is not much more than half a crop; dry weather in April hurt it—Clawson. More rye has been sown than in a good many years; it looks well. Barley and oats never looked better; two-rowed barley and Probsteier and "Summer Sult" oats. About the same acreage of corn as last year; it is small. Grass fine—what there is of it. Apple crop light. Peach trees are loaded with fruit. Of berries there will be an abundance. M. S.

FISHER'S, Ontario Co.—Wheat acreage 20 per cent. of the farms, or about the usual amount; probably less than half a crop—Clawson and red. Oat and barley acreage 10 per cent. of farms; prospect 100 per cent. Rye is a fair average, though but little is sown. Corn and potatoes, the usual amount planted—about 10 per cent. of the farms to each—but it is too early to report on them. Apple prospect very poor; many orchards are ruined by the Army worm. But little is done in small fruits. P. A. W.

Norton Hill, Greene Co.—Crops hereabouts look well, except corn which the constant rains have kept backward and without cultivation besides preventing a larger seeding. Winter wheat is badly lodged; but oats look splendid. Grass is a fine crop and new seeding is excellent. Orchard fruits will be almost a failure; what was set has generally dropped off on account of the rapid growth of the trees. W. H. I.

OPEN MEADOWS, Chautauqua Co.—Winter wheat was very badly winter-killed; it will not be over from one-half to two-thirds of a crop—Clawson and Treadwell and a little Log Cabin. Oats and barley are very fine. Grass never was better. Corn looks very bad. Much of it had to be replanted on account of the seed not germinating. Apples and small fruits abundant. No peaches. R. N. D.

PALERMO, Oswego Co.—We live in a dairy section. Very little wheat is raised; not over 50 acres of Winter wheat in our town, and that rather light. Owing to the early Winter there was not as much rye sown as usual; a fair crop is expected. Oats are looking very fine. The prospect for corn is very fair; more planted this season than last. Apples will be a light crop. Small fruits an average one. W. S. L.

New Jersey.

PATTENBURG, Hunterdon Co.—Acreage of wheat about same as last year; outlook not so good; but the prospects are good for rye and oats. Good prospect for corn, with about the same acreage as last year. Small fruit crops good. Apples, pears and other orchard crops light. A. S. M.

Pennsylvania.

Belle Vernon, Fayette Co.—Wheat is a good crop; acreage larger than usual—Fultz mostly. Outlook for oats good; acreage smaller than usual. No barley, and very little rye. Outlook for corn not very encouraging; an overabundance of rain, and fears are entertained that the corn on all low ground will be drowned out; more than that, the corn did not come up well; acreage smaller than usual. Apple prospect not very encouraging—falling off badly. Cherries very scarce. Good prospect for raspberries and strawberries. Good prospect for a heavy hay crop. M. M. W.

Brookfield, Tioga Co.—The acreage of wheat, both Winter and Spring, is about on an average with previous years; outlook for Winter wheat 40 per cent. better than last year; for Spring wheat about 30 per cent. better. Oat acreage 10 per cent. less than average; prospect 40 per cent. above last year's. Winter wheat—Clawson, White Diehl; Spring wheat—Bearded and Mammoth. Oats good—White English and Probsteier. Barley, acreage 20 per cent. above average; prospect 30 per cent. better than last year. Scarcely any rye is raised. Corn acreage below last year's; prospect not good. Apples and pears promising. Peach buds killed in Winter. Small fruits little raised; what there is looks promising. Grass crop will be nearly double that of last year. E. H.

COLUMBIA, Lancaster Co.—Wheat and rye look well, the late rains having brought them forward wonderfully. Corn is rather short and irregular, but it is improving fast. Potatoes look well—never better. Grass is good and growing better. F. B.

DALTON, Lackawanna Co.—We have had a very favorable Spring although a little too wet of late. Crops are generally very good for this time of the year. Grass is above an average. Wheat has an increased acreage; mostly Clawson and Fultz; it is looking well. Corn is backward on account of the wet weather, but it came up well; acreage about the same as last year. Potatoes have an average acreage; they are looking well with a prospect that they will outgrow the bugs. Oats are looking very fine. Rye better than for several years; some fields lodging badly. Apples a fair crop but not as large as last year. Pears and cherries full crops. Strawberries a large crop; other small fruits not cultivated to any great extent. W. A. D.

FARMINGTON, Fayette Co.—The acreage under small grains is about the same hereabouts as last year except wheat, of which a somewhat smaller amount was sown—mostly Clawson, though a sort called "White Irish" is becoming quite popular. The prospect for all small grains is fair. The outlook for corn is poor on account of unfavorable season and bad seed. Grass, our main crop, is fine and promises an abundance of hay. Apples enough for home consumption; peaches a failure. C. P.

Delaware.

MILFORD, Kent Co.—Wheat and corn are the principal crops; the acreage of both is equal to that of last year. The yield of wheat is supposed to be short one-third; many fields are badly winter-killed—Fultz and Amber principally. Corn is looking well. Peaches a total failure. Pears a small crop. Old apple orchards are full; young bearing orchards have a scanty crop. Strawberries an over crop; raspberries a fine crop. H. R. K

Maryland.

Cambridge, Dorchester Co.—Acreage of wheat about the same as last year, but the outlook is not so good. Not much oats, rye or barley. Wheat and corn are the principal crops. The acreage of corn is about the same as last year; it is not as far advanced as usual; but it is looking well. Peach trees along the river are full, but away from the river there are none. Plenty of apples, and also of small fruits. S. D. A.

EASTON, Talbot Co.—Acreage of wheat about the same as last year. Probable yield about 95 per cent. of last crop. Longberry and Fultz, the chief varieties. Oats, barley, rye, etc., do not rank as crops here. Corn looks well; acreage about as usual. Peaches will be a light crop. Some trees winter-killed. Apples promise a fair yield; small fruits will average as usual. H. S.

MARLBORO, Calvert Co.—About the usual acreage of wheat and rye; both badly winter-killed. Fultz is the most popular variety of wheat. No barley. Oats are looking first-rate. About one-half of the arable land we plant to corn—nearly all the rest to tobacco. Tobacco is followed by wheat or rye with clover or, by oats. Corn is growing finely. Apple and pear trees are heavily laden. No peaches and few cherries. Other small fruits abundant. W. M. C.

SOUTHERN STATES.

Virginia.

CHARLEMONT, Bedford Co.—Wheat acreage about half as large as last year; crop poor—mostly Fultz and Lancaster. Oats good; area, an average one; rye, ditto. Prospects for corn good; a larger acreage than last year. Grass not much over half a crop. Tobacco acreage very large—all planted. Orchard and small fruit prospects excellent. G. B. M.

DALEVILLE, Botetourt Co.—Acreage of wheat about an average; some good fields; some sorry ones; seems to be filling well, but can hardly be a full crop—Lancaster, Fultz and Light-chaff Amber. Oats very poor on account of seven weeks' drought. Corn an average acreage; very late. No peaches except in a few favored localities. Apples and small fruits short. T. C. D.

FANCY HILL, Rockbridge Co.—The quantity of grain sown in this section is about a usual average; prospect for wheat, medium; oats, barley and hay, very short. Great trouble in getting a stand of corn; prospect for a good crop not good. Acreage of all crops about as usual. Lancaster, Fultz and Amber wheat chiefly; Lancaster preferred. Orchard and small fruits good. W. G. W.

Genito, Powhatan Co.—Some fine wheat, but much has been damaged by the fly; not an average crop. Fultz is the principal variety. Oat crop much retarded by cool, dry weather; has improved since late rains. Outlook tolerably good for an average crop. No barley; very little rye. Apple and cherry crops are quite abundant. Peaches scarce. No small fruits cultivated for market. Small decrease in the acreage of corn, but considerable increase in tobacco. F. L. D.

MOORE'S STORE, Shenandoah Co.—The outlook for wheat has never been so good; acreage larger than last year—principally Key's Prolific. Oats good. Rye ditto. Barley very little sown. Prospect for corn very favorable; acreage larger than last year. Orchard and small fruits almost entire failures. Grass very fine. "The rain it raineth every day," and everything looks very promising. D. S. A.

NORFOLK, Norfolk Co.—Corn fair for a late Spring. Oats short from dry weather. Apples a medium crop. Peaches plentiful. Pears short. Chickasaw plums abundant. Strawberries the largest crop ever grown. J. B.

Oakley, Mecklenburg Co.—The acreage of wheat is about the same as last year; but the outlook is about 25 per cent. worse for a good yield. Nine-tenths of our seed is Lancaster and Fultz and of this three-fourths are Lancaster. Of rye and barley little is sown, and the outlook for both is poor. The prospect for corn is bad owing to the late season and the use of poor seed; acreage a little less than last year. The prospect for orchard fruit is extremely bad. T. B. L.

West Virginia.

CEREDO, Wayne Co.—Acreage of wheat about two-thirds of last year's; prospects poor. Oats about one-quarter of the acreage of last year; an entire failure. Prospects very poor for corn; many fields have been replanted two or three times. Acreage about the same as last year. Orchards do not promise much. Grass almost a failure. In the middle of June we are in our sixth week without rain enough to wet the ground half an inch deep. P. H.

Farmington, Marion Co.—The wheat crop of this section is about 10 to 15 per cent. short of last year's, but the acreage is increased about 10 or 15 per cent. Oats are looking extra-fine on last year's acreage. Ennobled Oats and White Elephant Potatoes are doing very finely; potatoes generally are booming. Farmers had generally their corn to plant twice, on account of bad seed, but they have a good stand now, and it is growing rapidly; the acreage is slightly increased over last year's. Apples and pears have a fair prospect. No peaches—only a few trees in this section. Strawberries, a good crop, and a fair prospect for all small fruits. A. M. T.

PHILIPPI, Barbour Co.—Wheat is looking well on new land; on worn-out land it is of little account. About the same acreage as last year; but the total yield will be from 10 to 20 per cent less than then. Fultz is principally sown. Not many oats sown this year; what there is look well but they are late. Corn is looking bad; it came up looking weakly and much did not come at all; the season is two weeks late. Some farmers at the middle of the month were still planting new land and some replanting their old land. Cut-worms worse than for years. About the same acreage planted as last year. Plenty of apples and cherries. R. M. T.

North Carolina.

BROOKSTON, Warren Co.—As compared to last year, wheat is 50 per cent. less in acreage and 25 per cent less in condition—Fultz and "Little Red." Oats about the same as last year. Barley and rye but little grown. Corn promises well; acreage about 10 per cent. less than last year. We have promise of a wonderfully abundant crop of grapes. Fine growing weather; all crops doing well. M. B. P.

FAYETTEVILLE, Cumberland Co.—Wheat acreage about the same as last year; an average outlook. The apple crop bids fair to turn out well. Very few peaches—too much cold weather. J. K.

Georgia.

GRIFFIN, Spalding Co.—Acreage of wheat much smaller than last year; yield will be good. Oats very short in consequence of drought; not over half crop. Barley and rye but little sown. Purple Straw red wheat and red rust-proof oats chiefly grown. Corn very small but healthy; the long drought damaged it. Acreage 20 per cent. larger than last year. But little fruit aside from apples which will be abundant. Cotton very backward—30 per cent not up. H. W. MC. W.

Florida.

JACKSONVILLE, Duval Co.—No wheat, barley or rye. Some rust-proof oats. Very little corn raised here—mostly imported. For the principal "orchard" crop, oranges, the prospects are favorable. Peaches good. Wild plums good; ripe now. Grapes well set, but have begun to rot. Scuppernong promises well. G. W. D.

SANTE FE, Bradford Co.—No wheat grown here. Oats are an average crop. Corn is a good crop. No apples are grown here. Peaches, plums, quinces are good; small fruits splendid, and our orange crop now is good. J. W. D.

TALLAHASSEE, Leon Co.—No wheat or barley raised here. Oats failed last year owing to rust; few sown this year; these about all harvested; yield light through drought. Rye same as oats. Rather more corn planted than last year. Owing to late cold in April, followed by eight weeks of drought, the crop looks bad. The late rains will improve it. Orange trees were either killed by frost last Winter or so badly damaged that there will be no crop. Very few apples or pears grown here; peaches promise well; Le Conte pears are now being planted quite extensively. Strawberries about done bearing. Crop short on account of drought. J. P. A.

Alabama.

SAND SPRING, Limestone Co.—The acreage of wheat oats and rye is somewhat larger than in former years, for the cotton growers of this county are beginning to see the necessity of raising their own bread and stock feed. One planter in my neighborhood who has been putting out nothing but cotton and corn each year for the past 30 or 40 (except during the war), has this Spring taken a new departure, and sown 80 acres of oats and the same to Red Clover. The oats are now fine and the clover a good stand, and a great many others are doing likewise. Wheat is better than it has been in the past three years; no rust or fly to hurt; but it is rather thin on the ground; we are now in the midst of June and of the wheat harvest. The varieties chiefly sown are Bowden, some Fultz, and some Mediterranean. The prospect for corn is better than usual; acreage about the same as last year. Apples and peaches are about half a crop. Plums, strawberries, raspberries and blackberries are abundant. W. M.

Mississippi.

OKOLANA, Chickasaw Co.—Very little wheat, barley or rye has been sown through this section. Oats are sown to a considerable extent and generally look promising, especially the Rust-proof Red Oat. Acreage of corn about the same as last year, but the plant is not so promising. Peaches are our principal orchard fruit, and they are all lost through frost in Spring. Apples, grapes, plums, etc., look well. T. S. B.

Texas.

UVALDE, Uvalde Co.—In this county there are about 400 acres of wheat—mostly Mediterranean—that will average 20 bushels per acre; 200 acres of red oats, averaging 45 bushels per acre. The corn crop is good and will be fully 70 per cent. greater than last year's. No orchard or small fruits except wild ones. This is almost exclusively a stock country. H. N. D.

Kentucky.

JERICHO, Henry Co.—Wheat not much over half a crop. Oats good. Rye and barley only a little more than half crops. Outlook for corn good on an increased acreage. Tobacco almost all set; a large increase of acreage; fine appearance and outlook. Orchard grass is one of the staple crops of this country and there is a splendid stand. T. M. S.

Paducah, McCracken Co.—From the best information I can gather, only from a third to a half the usual acreage was sown to wheat last Fall in this district, including seven counties, and the yield will hardly be over half a crop per acre—chiefly Mediterranean and Fultz. Oats look very well though they are not a large crop. The corn prosprospect is very poor: more than half the farmers had to plow up their first planting and replant, on account of poor seed; acreage a little larger than last year's. Only half a crop of apples. Peaches a pretty full crop. Tobacco, one of our chief crops, is suffering severely from drought now—only two small showers since May 2 till mid-June, and the hottest sort of weather; only half the usual acreage is yet set out, and that has had a poor start. G. W. H.

PINE GROVE, Clark Co.—Acreage to wheat 50 per cent. above average: will be ready for harvesting by June 20; developing very badly: the fly is ruining some fields that promised a large yield; nearly all look sickly. Fultz succeeded well till last year; still it is the only wheat worth mentioning that we have had for years. Undoubtedly the parasites have the best of the wheat crop, and we should "go slow" on wheat until further developments. With a good acreage and promise of large yield barley will be harvested before this is read. Small amount of rye sown; a fair prospect as to yield. Oats little raised, but considerable used in feeding Short-horns and racers. This is the section that produces $10,000 cows; Maud S; Longfellow; and it furnished the blood for the Derby winner. We had a very backward Spring for plowing, causing corn planting to be late; it came up poorly, many fields having to be planted over the second time: acreage a good average. Tobacco promises well the State over. A great deal of hemp is raised here; prospect fair. Not as much attention is paid to orchards and small fruits as should be. Good prospect for all kinds. G. G. T.

TRENTON, Todd Co.—Wheat is in a critical condition on account of rust; so far it is mostly confined to the blade. A few who have the earliest varieties are harvesting in the dough state: but the bulk of the crop is yet too green. Acreage five to ten per cent short; all winter wheat—Fultz, Odessa, New York, Amber and Boughton. Oats and hay short on account of drought. Prospect for corn good; acreage the same as last year. We have an abundant crop of peaches; very few apples. We give but little attention to small fruits. Tobacco is our staple and main-stay. The outlook for it at the present time is gloomy. T. D. W.

Tennessee.

BELL'S DEPOT, Crockett Co.—Acreage of wheat small; prospects gloomy—Bearded Wheat and Red Chaff. Corn spotted; acreage about the same as last year. Outlook good for orchard and small fruit. S. J. W.

Dresden, Weakly Co.—Wheat outlook not very favorable on account of drought; acreage unusually small—Fultz and Red Chaff. Oats a better crop than usual. Rye a medium crop. Prospect for corn medium. Harvest prospects poor. Apple crop very light, and other orchard fruits correspondingly so. M. M. H.

Erwin, Unicoi Co.—Wheat looks well; better than last year. Acreage about the same as then—chiefly Fultz and Lancaster. Winter oats, good; spring-sown, light. No barley. Rye light. The prospect for corn better than usual; acreage larger. Apples scarce. Peaches abundant. Small fruits good. Harvest will commence about the 1st of July. J. B.

LINCOLN, Lincoln Co.—Wheat acreage about the same as last year; prospect at least 30 per cent better—Fultz and Swamp; no Spring wheat. Oat acreage 10 per cent. larger; prospect 20 per cent. better. Corn prospect generally very good; acreage larger than last year. Sorghum acreage much larger than last year; prospect mostly good. Apples 60 per cent. less than last year. Peaches a third of a crop. Grapes a very full crop set. W. S.

ROBERSON FORK, Gilo Co.—Acreage of wheat 30 per cent. less than last year—Boughton and Missouri; yield good. Oat acreage somewhat larger; crop looks fine. The acreage of corn is 20 per cent. more than last year; looks well where cultivated well. A good crop of peaches. Apples almost a failure with all early varieties; a moderate crop of late sorts. This is a cotton country; acreage 10 to 15 per cent. over last year; looks well. D. H. T.

WESTERN STATES.

Ohio.

BELLEFONTAINE, Logan Co.—The prospect for wheat is good; acreage about the same as last year—mostly Scotch Fife and Fultz. The outlook for corn is not so good as last season, so many planted poor seed. Outlook fair for orchard and small fruits. J. E.

DOYLESTOWN, Wayne Co.—Wheat acreage as large as last year, if not larger; the crop is looking very well—as well as last year—mostly Fultz; scarcely any Spring wheat. A smaller acreage of oats than usual, on account of the late Spring. The prospect for a good crop of corn is pretty fair, although a good bit of it had to be replanted; the acreage is about the same as last year. There will be but few apples, this being the "off" year. Peaches will be a fair crop. Small fruits of all kinds will be plentiful, excepting blackberries, which were badly frozen out. F. K.

Fredericktown, Knox Co.—Wheat acreage large—fully up to last year's; prospective yield one-fourth to one-third less—chiefly Fultz, with some Mediterranean, Clawson, Blue Stem and Gipsey. Oats look fine; acreage small. Corn generally small owing to wet weather; a large percentage had to be replanted; acreage fully up to last year's. Few apples; no peaches; some cherries; no plums; no blackberries; few raspberries, currants and gooseberries; strawberries unsurpassed in quantity and quality. L. D. W.

Hartford, Trumbull Co.—The acreage of wheat is larger than last year, and the outlook is favorable for a large yield. Oats are coming forward rapidly since the late rains. Fultz wheat is the leading variety, although a considerable area of Democrat, Lancaster and other varieties is sown. A great deal of corn has had to be re-planted, and cut-worms are badly injuring some pieces; acreage fully as great as last year's. Fruit, except pears and cherries, is not plentiful. Strawberries a pretty good crop. There are a few peaches and plums. Grapes are setting full. G. M. N.

Neptune, Mercer Co.—Wheat acreage 25 per cent. less than last year; looking well—mostly Sea Island, which yields about 40 per cent. more than Fife or any other sort. Oats about the same as last season; looking fine. Very little barley is sown here; what there is is doing well. Of corn the acreage will be reduced perhaps 30 or 40 per cent. on account of lateness of season. Potatoes a larger acreage and looking well. No fruit of any account grown here. A. S.

TIFFIN, Seneca Co.—Wheat acreage larger than ever before; outlook very good; yet it was hurt much by the May drought—Fultz is the best yielder, but we also raise Lancaster, Amber, Gipsey, etc. Barley is so little raised that if we wanted to sow some, we would have to send off for seed. Rye ditto—a little raised for the straw only, used for tying corn fodder. Oats are an average. Our prospect for corn is very poor; the acreage is about the same as last year, but owing to the drought in May and poor seed much of it is not up yet—June 20. We shall have a fair crop of hay. Apples scarce. Peach trees full. A good prospect for pears and cherries. Gooseberries and currants are leafless—stripped by the worms. Blackberries mostly killed. Raspberries are good. J. S.

TWENTY MILE STAND, Warren Co. Wheat acreage two-thirds of last year's; the outlook portends a falling off of one-third in yield also. Some wheat fields were plowed up and sown to rye which crop, though small, looks well. Some corn fields are looking fine, but some were still unplanted at the middle of June—fully half the crop had to be planted over once or twice. Oats look tolerably well, but are very short in leaf. Barley will be a quarter of a crop; two-thirds of the average acreage was sown. During the hot, dry May meadows were nearly burnt up; now we are having an excess of rain which prevents corn cultivation. J. D.

Indiana.

BUTLER, DeKalb Co.—Acreage of wheat, corn and oats about the same as last year; outlook of wheat about one-third of a crop—Fultz and Lancaster mostly. Oats a full crop. Corn ditto; late on account of the drought; farmers had to replant. Hay half a crop. Apples a full crop. Peaches, none—trees killed by the hard Winter. Small fruits one-fourth of a crop. W. C. R.

FRANCESVILLE, Pulaski Co.—An increase of wheat; one-fourth winter-killed; the remaining three-fourths will mature about 10 bushels per acre if it fills right—Fultz and Lancaster; the latter does best. Oats good—common white and Norway; the latter by far the best. No barley. Rye very good. The prospect for corn is good, fully 40 per cent. better than last year. Orchard products a failure; so are strawberries; other small fruits an average crop. W. M.

Franklin, Johnson Co.—An average acreage of wheat and oats: but a poor prospect for a good yield. We shall probably have an average crop of corn. Orchard and small fruits scarce. J. M. P.

Kingsbury, La Porte Co.—Wheat outlook bad; notwithstanding earlier reports. Winter wheat will not average over three bushels per acre in this county. Not much rye. Oats and barley are poor now owing to late severe drought. Prospect for corn not flattering. Grub-worms and cut-worms are doing their best and much of the crop will amount to but little. The acreage will be larger than usual owing to the winter-killing of wheat. Apples will not be very plentiful. Pears not grown to any extent. No peaches. Small fruits will be abundant. W. E. H.

LAFAYETTE, Tippecanoe Co.—Wheat a full acreage, though the yield will not exceed 25 per cent. of last year's—Fultz. Oats a large acreage; outlook very good. Rye a small acreage; outlook good. The prospect for corn was never better. Orchard and small fruits, a poor prospect. L. K.

LEBANON, Boone Co.—Wheat will fall a quarter short of last year's crop. Corn good on an acreage larger than heretofore. Oats poor. J. R. C.

NAPPANEE, Elkhart Co.—Acreage of wheat 50 per cent. below last year's—a fair stand. Area of oats 70 per cent. less—a good average outlook. Acreage of corn about 70 per cent. of last year's—a good prospect. Potatoes an average acreage and outlook. Early apples a good crop; late, a middling one. Small fruits a moderate crop. C. E. C.

Plymouth, Marshall Co.—Acreage of wheat about the same as last year; outlook poor—it can't possibly make more than half a crop—mostly Fultz. Oats middling. Rye is below an average in area and condition. A tolerable outlook for barley. The acreage of corn is about the same as last year; but it is very backward, and the prospect is less encouraging. The outlook for orchard and small fruits is below the average. A. A. L.

WESTVILLE, La Porte Co.—Wheat acreage much enlarged, but it is almost a total failure; will not raise our seed—Egyptian and Fultz. Oats look bad. No barley and very little rye. Poor prospect for corn, though more has been planted than last year. Outlook for orchard and small fruits gloomy. C. W. C.

Illinois.

ALEXIS, Warren Co.—The acreage of Fall wheat is about the same as usual; but the yield will not be half an average one. The ordinary amount of Spring wheat was not sown on account of the lateness of the season; what there is looks well. More than an average acreage of oats which look well. Corn is late and its appearance is not very promising. Not over a third of a crop of apples and half a crop of small fruits. C. D. T.

ASHKUM, Iroquois Co.—Corn, oats and flax are our principal crops; a large acreage of all, and a far better outlook than at this time last year. Grain of all kinds is "booming" just now. Prices, good; farmers in fine spirits. M. R. M.

Du Quoin, Perry Co.—Wheat half a crop—mostly Fultz; acreage about the same as last year. Rye same as wheat; not much sown. Oats promising. Barley, none. Corn looks well. Late fruits are poor. J. B.

HILLSBORO, Montgomery Co.—Wheat not over one-fourth of a crop; this county was the second in the State last year. We sow seven-eighths Fultz and one-eighth Mediterranean. Prospects for corn good; one-half more than last year. Apples good. Peaches none. "G."

Kankakee, Kankakee Co.—An average acreage of Winter wheat; it was injured by the severe Winter and the drought in May, so there will not be more than a half crop. Rye came through the Winter in good condition, but owing to the drought it will not be more than half a crop. Oats and grass light, owing to the same cause. Corn promises well on an average acreage. Apples a light crop; strawberries fair; currants and raspberries about half a crop; blackberries, none; grapes a very light crop. J. M.

Mazon, Grundy Co.—Wheat and barley are not raised in this section. The acreage of oats and rye is, I judge, 110; the outlook for them, owing to an early drought and recent rains, is not over 90. The prospect for corn, except where the land is too low and wet, is very good; the acreage, compared with last year, 90. The farmers are converting this into a dairy country; hence they plant less corn and seed down more each year. We have a good crop of strawberries, but the prospect for other small fruits is poor, and for orchard fruits very poor. The trees blossomed well, but for some cause the fruit failed to set. D. W. F.

Metamora, Woodford Co.—Oats, barley and rye are looking well. Not much Spring wheat sown. Winter wheat looks well, but not so heavy as last year: chiefly Mediterranean. Prospect for corn good; the early planting is splendid: the late planting not so good on account of dry weather and cut-worms, but the rains of the last week are going to make the late corn all right; acreage fully as large as last year. Orchard fruits scarce; cherries, ditto; berries a fair crop. J. P.

Normal, McLean Co.—Very little wheat sown, and that badly winter-killed; will not make more than a quarter to half a crop. Corn mostly late planted; acreage fully up to last year's; doing splendidly, but will need a late Fall to ripen. Oats, rye, grass and potatoes all very promising. Pears, apples and cherries nearly a failure. Strawberries a fair crop. Blackberry canes injured on some plantations by frost, but where sound they are very full. A. D. F.

PLANO, Kendall Co.—Little or no wheat, either Winter or Spring, and very little rye or barley. The acreage of oats is about the same as last year, and the outlook is fair. Though corn is our main crop the acreage is not as large as last year on account of the lateness of the Spring. Orchards and small fruits a failure. W. H. H.

STONE CHURCH P. O., Washington Co.—Wheat acreage large, but oulook very poor. Timber land the best for wheat; several pieces plowed up—Fultz and Red Sea. Chinch bugs and Hessian fly abundant. Oats looked well, but are drying up. No barley and rye, except the latter here and there for early feeding. Corn is suffering for rain; much injured by cut-worm; acreage about the same as last year. Apples, three-quarters of a crop. Peaches, none. Small fruit, ditto. A. M.

WATERMAN, DeKalb Co.—No wheat. Oat acreage one-eighth more than last year; outlook good. Very little barley; looks well. Rye, one-twentieth more than usual; looks well. Oats are our general grain crop. Corn acreage about the same as last year; prospect very good until recently. Season very late. We are having a regular June freshet. Apples five per cent. of a crop. Cherries 10 per cent. Strawberries will be a fair crop. Raspberries, half a crop. Currants and gooseberries, 80 per cent. of a crop. Blackberries, none. J. F.

Michigan.

ADRIAN, Lenawee Co.—The horrible May has virtually destroyed our wheat crop and made corn very backward. About June 12, the weather became favorable and all vegetation jumped. D. R. A.

ALAMO, Kalamazoo Co.—Wheat acreage about the same as last year; yield will hardly be over 50 per cent. of that in 1880—Fultz, Clawson and Lancaster. Corn prospect good; acreage the same as last year. Barley and oats short on account of drought. E. E. J.

ALLEGAN, Allegan Co.—Acreage of wheat and oats about the same as last year. Wheat badly injured; will yield about 60 per cent. of a full crop, chiefly Clawson. Oats look well on account of recent rains. Meadows were somewhat injured by the drought in May, but now promise to give an average yield. Acreage of corn about the same as last year; crop very backward on account of the late Spring; still we anticipate a full crop. The apple crop will be below an average while the peach crop is nearly destroyed by the cold Winter, except in what is known as the "Beach Belt" adjacent to Lake Michigan, which will yield about one-third of an average crop. R. F.

BATTLE CREEK, Calhoun Co.—We have had a backward Spring. We shall have about one-third of a crop of wheat; acreage about the same as last year—Clawson, chiefly. Corn and other grains are looking quite well. Some have plowed up Winter wheat ground; more Spring crops than usual have been put in. Prospects good for a fair crop of cherries. A good many pears. Some varieties of apples are full while others, such as harvest apples, did not bloom at all. O. B. G.

Dowagiac, Cass Co.—Wheat acreage about as last year—Fultz and Clawson: about half a crop. Corn looks very well: many had to replant owing to poor seed. Oats small but growing finely. Very little rye or barley. Prospect for apples, pears and small fruits good. Cuthbert Raspberry wintered finely. R. O.

EVART, Osceola Co.—Wheat acreage about the same as last year; outlook poor. Dry weather has injured wheat and grass badly—wheat, Diehl, Gold Medal and Clawson. The prospect for corn is very poor; acreage below last year's. The outlook for orchards is fair; but small fruits were very much injured by the cold Winter and dry Summer so far. E. O. T.

Gagetown, Tuscola Co.—The acreage of wheat is much larger this year than ever before; the outlook, however, is poor, as the crop was badly winter-killed and the drought too, has hurt it—mostly Clawson, Diehl and Fultz. Barley and rye very little sown. Oats and peas look bad on account of the dry weather and cold. The acreage of corn is larger than last year, but the prospect is not very flattering. As for apples, this is the "off" year and very few are expected. Small fruits are not going to be plentiful. Gardens and vegetables of all kinds have been hurt by dry weather and severe frosts. J. C.

LANSING, Ingham Co.—Acreage of wheat somewhat greater than last year, but the prospect is poor for over eight bushels per acre. The usual amount of oats have been sown, and though rather late, they are looking well. Barley and rye are not raised to any extent. Clawson and Fultz are the leading varieties of wheat, and the white and black oats. Owing to poor seed, corn did not come up well, but with favorable weather we shall have a fair stand. The acreage will not vary much from other years. A fair crop of apples is expected; no peaches; an average crop of cherries, currants, etc., and an abundant crop of berries. G. S. W.

MARSHALL, Calhoun Co.—There may be in this county 70,000 bushels of wheat, and the best informed farmers estimate the crop at only five bushels per acre—Clawson and Fultz. The outlook for corn is good, and the acreage about the same as last year. Fruit prospects are not very promising. E. T. C.

MARSHALL, Calhoun Co.—Wheat in this county, owing to winter-killing, is not over one-third of a crop—mostly Clawson. Corn looks well, but is a poor stand; acreage not so large as last year. Apples and cherries poor. H. F. D.

Ross, Kent Co.—The acreage of wheat is about the same as last year's; from the present outlook we shall have half a crop—mostly Clawson. Oats will be light, but as good as last year. Barley and rye are grown only by a few farmers. Meadows fine. The prospect for corn is good, with the exception of its being about two weeks late; the acreage about the same as last year's; yellow dent generally grown. The outlook for the orchard and small fruits is good. D. V. G.

Shelby, Oceana Co.—Wheat a creage about one-fourth more than last year; prospect for about a third of a crop—Gipsey and Clawson. Corn about an average amount; very backward, chiefly on account of poor seed. Oat area the same as usual; looks fine. What barley is in presents a fine appearance. Little rye; poor outlook. An average area of potatoes, which look well. Apples and peaches one-third of a crop; small fruits two-thirds of a crop; cherries scarce. J. S. P.

WARREN, Macomb Co.—The prospect for wheat is unfavorable; some farmers have plowed it under and sown the fields to oats or planted them to corn; much that is standing now is hardly worth harvesting; Clawson is chiefly sown. Prospect for corn and oats good. Barley and rye not much sown. Light crops of apples and small fruits. N. S

Iowa.

ATLANTIC, Cass Co.—Wheat acreage 10 per cent. larger than last year; appearance excellent for a large crop. Odessa, Rio Grande, Australian and White Russian take three-fourths of the ground sown to wheat. Corn is small and not over three-quarters of a stand; acreage 10 per cent. smaller than usual. Corn and hops are our main crops, and as the former is likely to be poorer than for several years, it is not improbable that we shall be in a worse plight than we have experienced in that time, so far as crops are concerned. W. C. W.

Corydon, Wayne Co.—Not much wheat grown hereabouts; not as good a wheat county as farther north, and chinch bugs of late years have made it an uncertain and unprofitable crop. Oats do well and are grown extensively. The Spring sowing gives promise of a fine crop—yield, with fair tillage, 50 bushels per acre; acreage about one-eight of improved ground. Barley does well but is not grown to any great extent—probably not more than one-tenth as much acreage as of oats. The same may be said of rye, only that there is probably twice as many acres raised as of barley. Corn prospect fair, though owing to the late Spring and the ravages by the cut-worm and wire-worm, it is not as good as last year at this time; acreage about the same as then—probably about one fifth of the land under improvement. This is not as good a corn country as farther west and northwest in the State; but better for grass; grazing and stock-raising are on the increase. The raising of timothy seed for shipment is also an enterprise that is yearly commanding more attention among farmers. Orchard outlook fair to good, though not equal to last year's. Small fruits better than ever before. J. W.

CRESCO, Howard Co.—Not one-fourth the usual amount of wheat was sown and it looks poorly—chiefly Lost Nation and Sea Island. Oats have about double the usual acreage and look well. Barley, with about double the usual acreage, is looking very poorly. The prospect for corn is good and the acreage one-third more than last year. Prospect for fruit very unfavorable. C S. M.

Dubuque, Dubuque Co.—Wheat nearly all winter-killed and the land replanted with oats and corn; consequently there is a much larger area of these two crops than usual, and they are looking fine. Wheat, Odessa, Clawson, White Russian, etc. Some Russian White oats have been sown and are very promising. Corn—Blount, Chester County dent, etc. Rye medium; barley, ditto. Apples (this is the "off" year) a light crop; strawberries and raspberries not half a crop. Grapes look well. E. R. S.

LOST NATION, Clinton Co.—Very little of either Winter or Spring wheat—not enough for home consumption. What little winter wheat was sown was nearly all frozen out last Winter. Spring wheat does not look well. The varieties mostly grown here are for Winter, Fultz, Grass, Odessa, and White Pola—the last named my father introduced in this part of the country two years ago, it is the hardiest winter wheat I ever saw. For Spring, the White Russian, Odessa and Grass are mostly sown. Rye looks well and always yields well, but there is not much sown. The prospect for oats is good. We are always sure of a good crop of oats here; acreage about the same as last year. The outlook for corn is not very good. It was all planted very late. Potatoes are doing well. Acreage a little larger than last year. Corn is our main crop. Grass looks very well. The prospects for fruit of all kinds are very poor; all small fruits not covered with snow or otherwise protected last Winter, were frozen to the ground. Just as soon as apple trees are old enough to bear they commence to die. J. S. B.

NORAWAY, Benton Co.—Acreage of wheat about one-tenth less than last year; outlook poor. The yield of corn per acre will not, most likely, be over half as much as usual, and the acreage is one-fifth less. Orchard and small fruits won't give more than a quarter of a crop. C. O. V.

RUSSELL, Lucas Co.—But little wheat is sown here—less this year than usual; prospect not very good. Oats have an average acreage, and outlook fine. Hardly an average breadth of rye; it is light. Corn, our main crop, has an average acreage, but the outlook for a yield is not encouraging. It is late and much of it had to be replanted. Flax is being sown more extensively than heretofore. O. W. R.

STANTON, Montgomery Co.—Wheat is late and has only a small acreage—Odessa and Grass. More oats than usual were sown, and the outlook is good. The little amount of rye sown looks well. Corn area the same as last year; but the planting has been very late. Fruits of all kinds will be more plentiful than usual, except cherries and plums, which will not turn out well. J. F.

VILLISCA, Montgomery Co.—The acreage of small grains is a fair average, but, owing to a very late and wet Spring, with some very hot, dry weather, the ground is in bad condition and the outlook below an average. Spring wheat is yellow with rust, and we don't raise any of the Winter sort. Rye looks fair. Of corn, our main crop, there is not much over half a stand, after most of it has been planted two or three times—damaged seed the chief drawback. All through this section no crops will be raised on low lands. G. Z.

WELLMAN, Washington Co.—Only about one-half the farmers have sown any wheat this year—Odessa and Mammoth Tea. More oats sown than ever known. Very little barley and rye—large yields where sown. Prospect fair for all the above. Prospect for corn is very good—not all planted yet in nearly mid-June; acreage very large. About half a crop of orchard fruits. Good prospect for all small fruits except cherries. E. B. S.

Wisconsin.

Arcadia, Trempealeau Co.—An average acreage of wheat, which is damaged by chinch bugs. For Winter wheat we sow Spring Red Chaff in the Fall, and it does remarkably well; for Spring our chief sorts are Fife, Club, Red Chaff, White Russian. Oats are a large acreage and No. 1 in condition. A large area is under barley, but it is being damaged by insects. Corn acreage much larger than usual, and the stand looks splendid. Grass never looked better; haying begins June 20. Few orchards here; but small fruits will be abundant. F. A. R.

Beaver Dam, Dodge Co.—Outlook for wheat good; almost all Winter; Spring wheat sown where the Winter was killed out. Varieties, Fultz and Clawson. Oats and barley a large acreage; both look well. A large acreage of corn—more than last year; middling outlook. No orchard fruits. A large crop of strawberries and raspberries. Our currant bushes were almost all killed by worms last year; those that survived have a good crop. W. E. B.

CASCADE, Sheboygan Co.—Acreage of Winter wheat more than double that of last year; about one-third of it has been plowed up, and fully one-third more is almost worthless; the other third is fair, but very late, and in danger from rust and insects. Owing to the failure of Spring wheat for two years scarcely any was sown the past Spring. White Russian is commonly sown in the Fall and Fife in the Spring. Acreage of rye three times larger than last year; yield about half as much per acre. Area under barley double that of 1880; prospect good. Oats ditto, ditto. An average acreage under corn; owing to cold weather and bad seed some had to be planted three times, and then plowed up and sowed to buckwheat. Grass, old seeding good; new, scarcely half a crop. Apples rather scarce; cherries plentiful. Small fruits abundant, except raspberries, which were badly winter-killed. G. L.

Deansville, Dane Co.—Winter wheat looks very poor, much of it having been winter-killed; Spring grain is thin on account of the late season and dry weather; but with the recent rains the prospect is fair for a medium crop. Corn is late, but looks well and bids fair for a good crop; acreage probably a third larger than usual. Very few apples. Small fruits, with the exception of blackberries, promise well. J. E. P.

Mequon, Ozaukee Co.—Only the usual number of acres were sown to wheat hereabouts this Spring—Fife and Russian; it looks well; Winter wheat has been "played out" here for the last 20 or 25 years, with very few exceptions. Barley, 50 per cent. or upward more than last year; looks well. Oats (white and yellow kinds), 50 per cent. more than usual; promise well. Rye seven-eighths winter-killed; but in the best years we raise hardly enough for home use. Hay better

than last year. This is not the best part of the U. S. for corn; the main sort planted here is a yellow flint, eight to sixteen-rowed; a few farmers plant the white and some the dent kind. The crop does not look good; not as many acres this year as generally. Our orchards and small fruits never did better than last year, and never looked worse than this year. C. R.

MONROE, Green Co.—Acreage of wheat, oats and barley about the same as last year; all are promising well, except Winter wheat, which will be about one-half crop. Corn prospects fair at present; with good weather and long season, good; acreage about same as in 1880. Orchard fruits not very promising. S. B. M.

TUNNEL CITY, Monroe Co.—Winter wheat looks well; but very little sown; Spring wheat was put in late; acreage light; prospect fair. Fultz for Winter; White Russian for Spring. Rye is thin, but only a little is sown. Oats promise well; acreage large. Barley is backward; but little sown. No apples. W. R. F.

Minnesota.

BELLE PLAINE, Scott Co.—Wheat looks very well; about three-fourths of the tilled land is sown to it every year. Fife is the only variety sown. Corn is very poor, owing to wet weather and poor seed. Apples look very well. No small fruit is raised here. J. B.

Hart, Winona Co.—Wheat, oats and barley look well; acreage not so large as last year. Wheat, Fife, Brooks's, Lost Nation and Black Sea. The prospect for corn is good, with a larger acreage than ever. Potatoes look well; no bugs. The fruit outlook in Spring was good; not so good now. A large number of trees are dying; the bark is loose. J. B.

KASSON, Dodge Co.—About 20 per cent. less wheat than last year; outlook as good as then. Oats about an average amount; prospect very good. About 15 per cent. more barley than last year; looks thin and sickly. Corn prospects are good; acreage 20 per cent. larger than ever before. J. R.

DULUTH, St. Louis Co.—This is not yet an agricultural country; but a timber region with a few small clearings here and there. Grass, potatoes and oats are raised more than any other crops, and these are fairish. No corn or orchards as yet. Small fruits are raised in gardens about the towns; prospect good. W. G. W.

LAKE CITY, Wabasha Co.—Acreage of wheat oats and barley about the same as last year; outlook not quite so good. Corn acreage the same as last year; prospect good. Small fruits look pretty well; orchard fruits rather poor. W. B.

Wykoff, Fillmore Co.—Acreage of wheat not more than 50 per cent. of last year's; appearance fair; but there is great alarm in regard to chinch bugs—chiefly Russian Fife. Acreage of barley 100 per cent. more than heretofore. Corn was got in a little late, but looks well, and from 100 to 125 per cent. more has been planted than last year. This increase is owing to a failure in the wheat crop for the last three years. Many varieties of apples were either badly injured or killed last Winter; Those that survived without injury are fruiting finely. Small fruits are abundant. No peaches here. W. H. P.

Missouri.

GAYNOR CITY, Nodaway Co.—Wheat acreage small; crop almost a total failure; average yield 10 to 15 bushels per acre. Oats a large acreage; very promising; average yield 50 bushels per acre. Barley and rye but little sown. The corn crop is not very promising owing to late Spring, bad seed and cut-worms; a large acreage; crop likely to be two-thirds of an average one, which is from 45 to 50 bushels per acre. The acreage grows larger every year, as a great many new farms are opening up. No orchard fruits of any account. Grapes, currants, gooseberries, strawberries, etc., are plentiful. W. F. G.

HARDIN, Ray Co.—Wheat acreage an average one; outlook portends almost an entire failure; half was winter-killed, the rest badly damaged by the Hessian fly, chinch bugs and rust. There will be none for shipment. Blue Stem, Fultz and Graham the favorite sorts. Rye and oats are good. No barley. Corn looks very well though planted later than usual; acreage decreasing yearly, being superseded by tame grasses and clover which are in fine condition. Outlook for orchards very poor. Peaches almost a failure. T. N. C.

SPRINGFIELD, Greene Co.—Wheat acreage equal to that of last year; outlook poor; cannot exceed 50 per cent. of last year's yield—Walker, Mediterranean and Egyptian chiefly—all Winter wheat. Oat acreage about as last year; outlook good. Corn is largely planted; gave much trouble to get it to "come up;" many planted some land two to three times; it is late, but promises well. Fruit outlook poor. The foot-prints of last Winter are more apparent as the Summer advances in all orchards on low lands or southern exposure. The more fortunate situations are but little damaged and will give some apples. The apple crop of this section can't exceed 10 per cent. of that of last year. The same may be said of pears cherries and plums. No peaches excepting a few in the hills along White River. Grapes and small fruits generally destroyed by the unprecedented frost of last Winter—exceptional grounds well protected give some grapes, raspberries and gooseberries. No blackberries. JOT.

TABERVILLE, St. Clair Co.—Wheat is a failure, and most farmers have plowed it up and replanted the land with corn—Mediterranean, Walker and May. Corn is king and its prospect very flattering and should Messrs. Chinch Bug & Co. not make their appearance, this section will witness one of the largest yields ever known. Oats look well and will be a good average crop. Small fruits in abundance; also late apples; peaches and early apples not so plentiful. C. P. G.

Kansas.

ALTOONA, Wilson Co.—Chinch bugs have destroyed about one-half the wheat on the upland; on the river bottom it looks well—Mediterranean or Red Sea, Fultz and Walker. No barley. Very little rye and oats, but both in good condition. Corn that has received proper attention looks well; one-tenth more planted than last year. Apple trees are not set so full as last year. A few peach orchards will be full, but the crop on most of the trees will hardly feed the worms. Gooseberries have been full. Blackberry and raspberry canes badly winter-killed J. H. G

Agricola, Coffey Co.—Wheat in the counties of Coffey, Lyon, Osage, Franklin and Anderson is scant half a crop—Fultz, Clawson and May; May stands best. The acreage of corn is one-fourth larger than ever before, and the prospect is one-fourth better than last year at this time. Oats three-fourths of a crop. Apples and peaches half a crop; small fruits splendid. Potatoes look fine. T. W. T.

COLUMBUS, Cherokee Co.—The acreage of wheat is about 10 per cent. greater than last year; but the prospect is very poor owing to rust and bugs; all varieties seem to fare alike—Mediterranean, Walker, Michigan White, Clawson and Fultz. Oats acreage 10 per cent. increase; outlook good. Flax area a trifle larger; prospect fine. Corn acreage about the same as last year; prospect poor; late and thin on the ground—too much rain. No apples, pears, peaches, cherries or plums. Berries look very promising. The wheat harvest began here on June 7; weather favorable for the work. H. A. H.

Cottonwood Falls, Chase Co.—The acreage of wheat in this county is above an average—Big and Little May and Grass. The outlook for oats and wheat is splendid—above an average. No barley and not much rye. Corn prospect first-rate; the acreage exceeds last year's. The out-look for orchard and small fruits is poor; not much interest taken here in fruit raising. Stock is the mainstay. J. S. B.

EVERETT, Woodson Co.—Wheat acreage is smaller than last year's, and the outlook poor owing to chinch bugs. This is not a wheat county and there is not much small grain of any kind. Prospect for corn good; acreage larger than usual. Peaches about one-quarter crop. All other fruits good. J. J. W.

HILL CITY, Graham Co.—But very little wheat; it will be but half a crop—Early May mostly. Corn acreage will be more than last year's; looking uncommonly well. Fruit trees of all kinds are doing well, but are too young to bear. S. S.

OGALLAH, Trego Co.—Wheat good; will make from 15 to 40 bushels per acre—mostly Red May. Oats, barley and rye very little sown. The prospect for corn is good; large acreage planted. Some planted late on account of wet weather all through May. The county is too new for fruit. A great many fruit and forest trees planted this Spring. Plenty of grass; cattle are looking very fine. J. P. M.

Continued on page 428.

ANNOUNCEMENT.

THE decree for this issue is "Sacrifice the literary departments to the crop reports." When our editor-in-chief graciously made this announcement, the first thought in view of the interest felt for those appreciating these particular columns, was to subject *some one* to the necessity of recording the *loss* of one *crop*—second thought, however, succumbed to better judgment, and dignity and amiability found an influential mission. Our practical neighbors mean well. RAY CLARK.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

THE KITCHEN CLUB IN COUNSEL.

ANNIE L. JACK.

IN Miss McGregor's cosy kitchen we all assembled one pleasant day in June. The subject was "Summer Recreations," and, by way of killing two birds with one stone, we were to arrange the way and manner of a church picnic to be held on a coming holiday. It is very noticeable even in a small community that nearly every family has some specialty in the culinary art that is convenient in getting up any public entertainment, and which, if studied, renders it much more easily managed. But for awhile we talked of Summer recreations, and how necessary it was that the steady strain of a season's work should be now and then broken by a day of enjoyment. Living on the banks of a river abounding in good fish, it is a great source of pleasure to take a few hours in angling, and wonderful how soon even young children become expert in this amusement, even little four-year-old bringing a fine bass now and then from the water. The games of lawn tennis and croquet are still delightful to young people, and should be indulged in for recreation, while a day's visit now and then to the city is calculated to do us good and also to make us more than ever contented with the pure air of our country homes. Another recreation seldom indulged in is riding, and I think every household should possess its saddles and riding habits for the daughters who can accompany their brothers in this healthful exercise. Pleasant little picnics to the woods (with agreeable company), are of value if the eyes are kept open for new specimens, botanical and entomological. In this locality there is one annual gathering at the close of the grain harvest. It is called the farmers' picnic, and is a pleasant reunion among neighbors who would not otherwise meet in a social manner. While Mrs. Thompson did not know whether she would take cake or pie, and Mrs. Ellerton gave us the latest recipe for crullers, Miss McGregor remarked that, though the children liked sweets and must be provided for, she observed that grown people enjoyed something a little more savory. So we decided to take plenty of sandwiches, and, as we were to light a fire, we could boil eggs and cook any of the fish the followers of the gentle Isaac might be fortunate enough to catch, and as one promised cold fowl, and another and another added their share, we felt that there was likely to be a full supply of good things on the coming holiday, and all agreed that too little attention is paid to these things among hard-working farmers and their families, whose lives are too often one unceasing round of toil, and who would be brighter and happier if they indulged in simple Summer recreations.

DOMESTIC RECIPES.

Gooseberry Catsup.

Three pounds of ripe fruit, four pounds of white sugar, a pint of good vinegar, two ounces each of cloves and cinnamon. Boil all together for three hours, careful not to burn. Bottle.

Very Fine Currant Jelly.

An equal quantity of white and red currants free from stems, leaves and dirt. Put into a *white* porcelain kettle with a very little water, just enough to keep the fruit from burning at first. Boil 20 minutes. Do not crush the fruit. Pour into a clean jelly-bag. Hang where the juice can run through, but do not touch or squeeze the bag. To each pint of this clear liquor add a pound of loaf sugar and boil in the cleansed porcelain kettle 25 minutes. Pass through another jelly-bag and pour into glasses. The bags can be well pressed out afterward and the juice therefrom made into an inferior jell. LONG ISLAND.

Peach Batter Pudding.

Pare some ripe and soft peaches, leaving whole. Arrange closely together in the bottom of a buttered baking dish. Make a batter of a quart of milk, six eggs beaten very light, 10 tablespoonfuls of sifted flour, a tablespoonful of melted butter, a little salt and two teaspoonfuls of baking powder sifted with the flour. Bake in a quick oven and eat hot with cream and sugar or a hard or liquid sauce. Strawberries, cherries, raspberries, or blackberries may be substituted for the peaches. MARY B.

Mrs. Jack's Chow-Chow.

Half a bushel of green tomatoes, one dozen medium-sized onions, one dozen green peppers, all chopped fine. Sprinkle over a pint of salt. Let stand all night, then drain off the brine, cover with good vinegar and cook one hour slowly. Drain again and pack in a jar. Then place in your preserve kettle two pounds of brown sugar, two tablespoonfuls of cinnamon, one of allspice, one each of cloves and pepper, half a cup of ground mustard and a pint of grated horseradish, with vinegar enough to mix them thoroughly. Boil for half an hour and pour at once over the mixture in the jar. Cover tight and it is ready for use, but will keep over a year if you are not tempted to use it before that time. It is a good deal of work to chop fine enough with knife and bowl, but I suppose many of my readers have thoughtful husbands who provide them with a mincing machine, in which case the chopping becomes easy work that small children can perform, and which they do in our household without finding it any hardship.

Kitchen Aprons.

IN RURAL of May 14, under the head of "Helps" in the article on Kitchen Aprons, the idea is conveyed of only one breadth being used, while from the waist down there are two. Have it rounded out, to come to about the bottom of the waist, then measure from the waist down, a second breadth, which split, sewing raw edge, etc. M. J. M.

Mother's Composition Cake.

Two cups of butter, three coffee-cups of sugar, one coffee-cup of milk, one coffee-cup of molasses, six coffee-cups of flour, six eggs, two pounds of raisins, one teaspoonful saleratus, spices as in other fruit cake. This will make two loaves. A very nice cake. S. A. Y.

Headache.

I noticed under the head of Domestic Recipes some one advises for headache or sour stomach taking one-fourth of one teaspoonful of soda at intervals of one hour. I wish to say for the benefit of those readers who may be disposed to test the efficacy of the above, to stop and consider that you are taking a powerful alkali into your stomach, which, if indulged in very frequently, will soon convince you that you have taken a remarkable leap toward confirmed dyspepsia. W. M.

Crystallizing Grasses.

Dissolve in a quart of soft water *all* the alum you can by heating and stirring—it may be a pound, it may be 20 ounces. Have the grasses divided into small bunches and tied. When the solution begins to cool dip in the grasses holding them there five minutes, three minutes, two minutes or one minute, according to size of crystals you wish. The cooler the solution the quicker the crystals form. When too cold reheat. I have used a glass jar to dissolve the alum in, heating it in a kettle of water with an old plate at bottom to prevent the jar breaking. One can see through glass the crystals forming and so know when to take the grass out. Do not let the grass touch the sides of the jar. AUNT FLORA.

Hard Soap Question.

Will the "Farmer's Wife" who sent the recipe for hard soap in "Domestic Recipes" of the RURAL of June 4th, please state the weight of the balls of resin, and where they may be bought, and oblige another FARMER'S WIFE.

[Cambridgport, (Mass.) American Protestant.]

A lady friend of ours called the other day and stated that her husband had seen St. Jacobs Oil advertised in our paper; he used it for rheumatism and was convinced of its merits.—*Adv.*

CROP REPORTS.

(Continued from page 427.)

Nebraska.

CLARKSVILLE, Merrick Co.—Wheat acreage one-third less than last year; outlook good on upland. Many farmers would like to plant twice the amount of corn they raised last year, but the ground is too wet to work; outlook poor. Orchards are too young to bear. Wild plums and grapes are plentiful. J. M.

BENNETT STA., Lancaster Co.—Winter wheat is almost a total failure; a few fields are fair, but most of it has been plowed and resown to Spring wheat; acreage rather more than last year—almost wholly Grass Wheat (a Winter or Spring sort); White Russian variety a failure here, but occasionally a fair crop. Oats a full crop; looking fine; a little more sown than last year. Little rye and less barley. Rye is sown in Fall, and is looking well. Corn prospect good; but much of it will be late; much to be planted yet. Early corn knee-high; acreage larger than last year. There are but few bearing orchards; almost all are young. Apples and cherries will be good. Peach trees almost all killed to the ground; climate is too uncertain for peaches. Plums always bear. Raspberries and strawberries fine crops. Blackberries partly killed. S. G. B.

Sarpy Center, Sarpy Co.—The prospects for small grains are good for an average yield; acreage about the same as last year. Chief among many sorts of Spring wheat are Big China, Golden Drop, Minnesota Spring and Grass. The prospect for corn is very unfavorable, some farmers have not finished planting now in the middle of June; a great deal had to be replanted and much of it was put in with listers, and the season was unfavorable for that way of planting, so that under the most favorable circumstances we won't have more than half a crop. The acreage will be less than last year. Orchard fruit is, in great, part a failure. Small fruits (with the exception of chorries and plums) are plentiful. J. G. B.

GREENWOOD, Cass Co.—Wheat acreage fully as large as last year; outlook for wheat and other small grains better than it has been for years. Corn acreage larger than ever before and outlook fully as good as last year for a large yield per acre. Prospect for orchard and small fruits good. H. C.

Dakota.

YANKTON, Yankton Co.—Owing to our terrible floods and occasional rains the acreage of all small grains is scarcely half what it was last year. This is also true of corn, which is very late. All small grains look better than I've ever seen here. We shall have more fruit this year than ever before, because new orchards are coming into bearing and the crop is good. All small fruits will be full crops. J. P. A.

Jamestown, Stutsman Co.—The area of wheat in this county is about 15,000 acres—nearly double that of last year; prospects never so favorable—Scotch Fife entirely. Oats and barley are fine. No rye; no fruit. E. P. W.

Watertown, Codington Co.—The present crop of wheat is the third ever raised in this county, which has been settled only three years; the acreage, as compared with last year, is ten to one; the outlook is good for wheat, oats and barley. Very little rye—somewhat winter-killed. We sow chiefly Scotch Fife and Lost Nation wheat. Spring being very late, little corn was planted; it is small, but looks well, and is of a good color. We are experimenting with fruit trees; they have wintered well. Small fruits that are old enough to bear are heavily loaded. S. S.

CENSUS AGRICULTURAL STATISTICS.

THE agricultural statistics collected by the late census are by far the most correct of all. The statistics of the Agricultural Department are necessarily to a great extent guess-work, and those of the State Boards of Agriculture and newspapers are in the same category. Those of the decennial census are, however, from the very nature of the mode in which they are collected, as nearly accurate as it is possible to make them. They have accordingly a peculiar interest for farmers, and therefore having just received from the Census Office those already tabulated, we hasten to place them before our readers.

AGRICULTURAL NEWS.

The fruit trees of Hartford, Conn., are so scourged by caterpillars that they are as brown as if swept by fire. Apples appear to be the favorite. .....Worms are playing havoc with corn in Bainbridge, Ga., and a sorry crop is inevitable; but watermelons are doing well and there will be a big crop.....Gatesville, Texas, is overrun with wolves that are making havoc in sheep folds. In some parts of the country they kill the sheep in the daytime.....At least one-third of the corn crop is entirely destroyed in Chancery, Ga., caused by a small white worm which bores into the young stalk just above the root.....In Arkansas a species of cut-worm has completely destroyed the stands of cotton on a great many large plantations. Many portions of the State are overrun with locusts.....Reports from Oglethorpe, Ga., give more worms and bugs, with greater appetites than ever known before, and the cut-worm has gone over to tobacco chewing in South River, Md. .....Even Texas complains of a rainy season that is ruining crop prospects, and Alabama cries out in sorrow over bud worms, and cold nights that are demoralizing farmers in Greene County. .....The entire Chowan section of North Carolina is suffering incalculable injury through the locust plague. Whole forests of valuable timber have been destroyed by the pests stripping the bark and depositing their eggs.....Farmers about Joliet, Ill. report fruit ruined, hay less than half a crop, while farmers from Lake City to Bidwell, Cal., say that all crops are looking well and the yield will be the largest ever known in the valley.....The grasshoppers, locusts and cotton worms have become such a burden that some Texas farmers will try the experiment of importing the Lubbock beetles from Russia that are very voracious and live on these pests.

Rose bugs are making sad havoc among the apple and blackberry blossoms all along the line of the Camden and Atlantic Railroad. Growers say that their work has been so thorough that the crop will hardly be worth the picking..... Wire worms are destroying the wheat fields of the Willamette Valley, California; a peculiar caterpillar is stripping the ash trees of the Butte Creek region of their foliage, and chintz bugs are working on the barley fields in Spring Valley, Minn..... Ashes are said to be sure death to the Army worm, and have been tried with great success at Potsdam, N. Y., by Lorenzo Norton. He sowed the ashes on a strip of land when the dew was on, and at night the ground was literally covered with the worms..... ....In Jefferson Township, Pa., the Army worms devoured completely seventeen acres of grass and two acres of corn belonging to Franklin Groff, and as they were about to enter another field of his he plowed a ditch into which they fell, when he burned them. Joseph Kalbach, of the same place, lost eleven acres of grass..... A simple remedy for all insects that annoy farmers is given by a Wenona, Ill., agriculturist. He says: "Gather all the old straw and hay into long rows around orchards, potato and cabbage patches, and set fire to one end to burn against the wind all night, and they will burn up millions and millions every night of the male insects that fly, and bugs of all kinds and descriptions, such as destroy the trees and potatoes, and all the cabbage, and the canker worms on the apple trees. They will fly right into the blaze and burn their wings off, and drop into the fire. I told a man to do that who said the ground in his potato patch was crawling alive with potato bugs. He plowed a ditch around and filled it with straw, and burned them all up in one night, and he raised a big crop of potatoes. The prairie fires in former years used to burn them all up. Do this and you will soon be rid of the whole miller tribe of insects."

The annual meeting of the Dutch-Friesian Breeders' Association was held at Bagg's Hotel Utica N. Y., June 18 and the following officers were elected for the ensuing year. Pres. C. R. Payne, Hamilton, N. Y., Vice-Presidents.—Dr. A. R. Gebbie, Lowville N. Y., Prof. W. J. Beal, Lansing Mich., H. F. Slade, Oneonta, N. Y., Secretary S. Hoxie, Whitestone, N. Y. Treasury, A. F. Cole. Pine Woods N. Y., Executive Committee, S. Burchard, Hamilton, N. Y., Robert Buroh, Schuyler N. Y., Irwin Langworthy, So. Brookfield N. Y.

In Missouri the thirteen year locust may be expected this year in the following counties: Audrain, Bollinger, Benton, Clarke, Charlton, Callaway, Cooper, Cole, Franklin, Gasconade, Iron, Jefferson, Knox, Lewis, Marion, Macon, Morgan, Moniteau, Pike, Phelps, Pulaski, Polk, Pettis, Schuyler, St Charles, St. Louis, St. Francois, St. Clair, Warren and Washington. In Illinois, in the following counties: Adams (south part, back of Quincy), Bond, Clinton (northwest corner, adjacent to Madison), Champaign, Coles, Crawford, Cumberland, Clay, Clark, Edwards, Edgar (especially in the eastern part), Franklin, Gallatin, Hardin, Hamilton, Johnson, Jasper, Jersey, Jefferson, Lawrence, McLean (east end), Macon, Madison, Marion, Massac, Monroe, Pike, Perry, Piatt, Pope, Richland, Randolph, Sangamon, Saline, St. Clair, Union, Washington, Wayne, Wabash, Williamson and White. In Kentucky, in the northwest corner. In Arkansas, the northern counties. In Alabama, Russell and the counties east of the Black Warrior river. In Tennessee, Davidson, Montgomery, Bedford, Williamson and Rutherford counties. In North Carolina, Mecklenburgh county. In South Carolina, the Chester district and the county adjacent to the Georgia line. In Georgia, Cherokee county. In Louisiana, Morehouse, Caddo and Washington parishes.

This year the thirteen year brood will cover the greatest area in the Southern States and in the Mississippi Valley. The entomologists say that the two broods of thirteen years and seventeen years have not appeared simultaneously before since 1660. Agriculturists may be content with the prediction that they will not again appear in the same year until 2102. This "harvest fly," or periodical locust, is a large black insect, with red eyes and four transparent wings. The insects are harmless, although it is said that the females sometimes, while carrying food to their young, may inflict a painful sting if interfered with. The only injury which they may cause is in boring holes in the trees in young orchards for the deposit of eggs.

"Why so much delay in selecting the Agricultural Experiment Station?" is a question often asked. It seems the Comptroller hesitated to grant the funds for the farm under the notion that the bill granting the appropriation was unconstitutional. His doubts having been removed, the money is ready and the Station will probably be soon located. So say some; others say there will still be a world of delay.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JUNE 18.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, June 18, 1881.

ALCOHOL—Held higher; 35½@37c.

BEANS AND PEAS.—Beans have sold sparingly for home or export use. The latter buyers say they have no margin in the West Indiess the main outside point for marrows. Sellers regard the stock of white as a safe one and feel that they have plenty of time for the market to keep a regular course, and that no great sacrifices need be made for fine marks at present. Colored beans are in over-stock and dull.

Marrow beans, prime, $2.47½@2.50; other, $2.30@2.40; medium, prime, $2.40@2.45; other, $2.20@2.35; pea, $2.25@2.50 white kidney, $2.30@2.40; red kidney, prime, $1.57@1.60; fair to good, $1.40@1.50; black or turtle soup, $1.40@1.45. Peas generally quiet at $1.50@1 55 ₱ bush for green Wis. and $1.62½ ₱ bush, bag Southern B E.

Receipts for week, 6 300 bush.

Exports do. 955 pkgs.

BEESWAX—Jobbing at 23½@25c., the latter for choice Southern.

BUTTER.—A steady active trade in fine State. Prices are stronger for parcels suitable for best local use. Exporters bought liberally while choice creamery was obtainable at 21c., but after they got well to work upon such lines sellers made what may prove to be a bad mistake by withholding a full choice of quality from wholesale buyers. The stronger feeling is in creamery alone, and sellers seem to feel warranted in the position they have taken by falling off in the quality of half tubs. Many producing sections of the latter are packing for June; it would perhaps have been better for exporters to have had longer liberty as the general receipts are heavy, and a surplus will be apt to depress and weaken the market. Western goods are doing well, but dealers are not striving for much advance upon last week as higher prices might only hold a temporary rule. The exports for June are less than one-third taken this date last year.

Creamery—Western, good to prime, 20@22c.; State and Penn. 21½@23c.; poor, 19@20c.; sweet cream, 20@22c.; State pails and h'f tubs, choice, 21@22c.; fair to prime, 19@21c.; Welsh tubs, 19@21c.; poor State, 14@18c.; firkins yellow, 20@23c; Western imitation creamery, 16@20c.; dairy fine, 17@19c.; other, 14@16c.; factory or ladle-packed, best, 15@16c.; other, 10@13c.; very poor Western, 9@10c.

Receipts for week, 36,879 pkgs.; exports, 8 034 do.

CHEESE.—A good animated market has been noted during the week and prices have advanced on the merits of stock this is always a wholesome feature. The weather, too, has been favorable for quality and the even condition of goods has materially helped sales. The exports include a good many Ohio cheese. Market closes strong and fairly cleared of stock.

State factory, fine, 9½@10c., fair to prime, 8½@9½c; poor to fair, 8@8½c. Ohios, fine, 8½@8½c; other 7@8½c; part skimmed, 4½@5½c.; full skims, 2@3c.; Wisconsin factory poor to fine 8@9½c.

Receipts for week, 26,700 boxes.

Exports for week, 107 500 boxes.

Liverpool cable, 63s. 6d.

Steam to Liverpool, 20@25s.

COTTON.—There is a general expression of depression here and abroad, and the market for spot or futures has ruled easy, but closes with a steadier tone.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running to quality not more than half a grade above or below the grade quoted.

Strict good ordinary	8 7-16	Middling	10¾

The close of the market for futures was officially reported as follows: June, 10.81@10.86c.; July, 10.85c.; August, 10.91c.; September, 10.62@10.63c.; October, 10.14@10.15c.; November, 10.01@10.03c.; December, 10 02@ 0.03c.; January, 10 13@10.15c.; February, 10.26@10.27c.; March 10.39@10.41c.

Receipts for the week 9,698 bales.

Exports do. 7,573 do.

DRIED FRUITS.—There is some movement in evaporated apples; shippers take some when they can obtain a shade off from current rates. The local trade is steady now that fresh apples are gone. Peaches scarce; too high for a brisk trade with Summer fruits abundant and easy. Small fruits steady when prime. It is thought the cherry crop will be shortened owing to the recent rains.

Apples evaporated choice 8¾@9c; fair to prime 7¾@8¼c. North Carolina sliced, common to best 6@6c. Va. do. 3¾@4c; Tenn in bbls. 4c. do bags 3¾@4c; State fine cut 3¾@4c., quarters 4¼@4½c; Western, 3¾@4¼c; evaporated peaches peeled 27@30c.; unpeeled 13@14c; sun-dried peeled 10@22c; unpeeled 6@8¾c. Plums 12@12½c. Blackberries 8c. Cherries 13@14c. Raspberries 23@24c. Whortleberries 11½c.

Receipts for the week, all kinds, 1,475 pkgs.

Exports dried apples, 2,033 pkgs.

EGGS—Receipts for week, 12,083 bbls.; do. last week 11,900 do. Prices have held up well, regardless of the free receipts and rather inactive Summer. A great point in dealers' favor is the cool, good keeping weather. A Summer month has been seldom noted with such light losses in Western stock.

Near points, 20@21c.; State and Pa., 18½@19c; Western and Canada, 17@ 8½c.; upper Southern, 18@18½c.; poor or ice-house, 17@17½c.

In answer to inquiries as to the method of putting up eggs for shipment, we give a standard form:—Use plenty of clean, dry, fine-cut straw with eggs. Mark plainly with paint—a stencil-plate is best—and note contents on the box or barrel. Send a letter at the same time, stating what is sent, the route, time, etc. An invoice or list should also be inclosed in the barrel or box. Always state the number of packages. Secure for yourself a trustworthy reputation for fine stock, put in best shape, so that your mark may be sought for

FLOUR.—The market has shown remarkable activity, especially as the bulk of the demand has been for home use. Exporters would perhaps operate to a larger extent, but prices at the moment are too much in sellers' favor. Fairly strong wheat helps to prop rates for flour.

No. 2, ₱ bbl. $3.00@3 75; State and Western superfine, $4.00@4.75; city mills extra, $5.50@6 50; Spring wheat do. $4.70@5 00; Spring XX and XXX, $5.25@6.50; patents, $6.00@8; ohio straight hoop shipping, $4.80@5.25; trade brands $5.30@6.50; St. Louis extra, $4.95@6 25 do double extra, $5.50@6 00; do. family $6.25@7; Southern shipping, $5.25@6. do. XX and family, $6.75@7.50. Rye, $5.45@6.90. Corn-meal, Brandywine, $3.25@3.40; Western, $2.75@3.30.

Receipts of flour for week, 91,300 bbls.

Exports of flour, 52,850 bbls.

FRESH FRUITS.—For a day or two strawberries have sold with some satisfaction for owners: but there have been some discouraging returns for so fine an installment of the crop as has offered during the past fortnight. Large fancy berries were never such a wholesale feature as they are this season. The veriest sidewalk retailer has been able to obtain lines of extras that equalled the display of the Broadway stores.

Up river choice, ₱ quart, 11@13c.; do. Wilson prime 10@12c; do. poor to fair 6@8c.; do. thirds, qt. 2@4c.; N. J. Wilsons ₱ quart, choice 8@10c.; do. fair 5@7c; do. ₱ pint, 3@5c. bulled plots 5c; small Hackensacks ₱ 100 $2@3.50. Gooseberries dull at $1 ₱ bush: cherries are in demand but the picking of the week have turned out poorly owing to the late severe rains. Choice quoted 12c; fair to good 8@10c; other 4@6c. Peaches opened well in quality but have already begun to fall off. South Carolina ₱ bush. $3@3.50. Georgia 3d ₱ bush $1@1.50 in good order. Hot-house Black Hamburg grapes, $1@1.50 per ℔. Southern plums $2@2.50 3d ₱ bush. crate. Fla. watermelons are showing but sales are slow, quoted $10@50 ₱ 100. A few green apples have appeared but not good enough for sales. Old apples quite out of market. Peanuts dull: Va. hand-picked, 4½@4¾c. ₱ ℔.; fancy, 4@4½c; extra prime, 3½@3¾c.; good to prime, 3@3½c.; shelled, 2½@3c.; pecan nuts, 7@10c.

GRAIN.—Crop reports are watched with interest and prices have shown the usual fluctuations incident to this part of the year. There has been only a fair demand for export, but prices for wheat close firm. Corn is active after recovering from lower figures. Oats are lower and pressed for sale. Rye has a good selling interest; some sales have been made for export.

Wheat, Spring 92c.@$1.21; do. No. 2, $1.20@1.21; do. No. 3, $1.13@1.11; red Winter No. 2, $1.26@1.27½; red Winter $1.15@1.31; white Western and State $1.18@1.27. Rye, $1.04@1.10. Oats, white No. 1, 51c.; white No. 2, 45½@46c.. white No. 3 44@44½c; mixed No. 1, 45½c; do, No. 2 45½c.; do. No. 3 45½c.; Corn, Western mixed 48@57½c.; do. No. 2 56@57c.; do. white 58@62c; Southern do. 59@61c.; do. yellow, 57@60c.

Receipts for week, wheat, bush., 1,509,320; corn, do 931,900; oats do. 280,350; rye, do. 12,315; malt, do. 3,600; rice pkgs. 923.

Exports for week, wheat, bush 947,250; corn, do. 953,675; oats, do. 4,619; rice, pkgs., 3,625.

HAY AND STRAW.—A little selected hay may be quoted at $1 ₱ 100, but the bulk of the arrivals is unattractive and slow of sale at the easy figures of the list. Straw has declined. Clover not quotable and prairie has ceased to arrive.

Choice retailing timothy hay 90c. ₱ 100 lbs.; second quality, 85@87½c. do.; shipping 50@60c. do.; Long rye straw 90c.@$1.05 ₱ 100 lbs.; short do. 60@65c.; do. other grain, 45@50c. do.

Exports for week, 556 bales.

HOPS.—There is very little new business. Exporters own considerable stock and parcels going abroad represent back purchases. The home demand is under a cloud; brewery men have been engaged in a stubborn strike, and the unusually cool weather has materially decreased the consumption of beer. Prices at the close are almost nominal.

Crop of '80 choice, 21@23c; good to prime 15@20c; fair to good, 15@18c poor to fair, 12½@15c; Eastern, 18@21c.; '79's, 15@17c.; '78's, 5@8c.

MAPLE SUGAR.—The remainder of sugar quoted 7@10c.; syrup, 75c.@$1 ₱ gal., with can. Syrup should weigh 10@11 lbs. to gal.

MILK.—The week has been cool and unfavorable for large use. The average for the week ending Tuesday was only 88½c ₱ can of 40 qts. Many lots of commission milk have made no return to farmers as freight was all that could be realized.

OIL CAKE.—Western quoted $29.50@30.

OIL PEPPERMINT—In tin, $2.35@2.40; in bottles, $2.60@3.60 for H. & P., and $3.75@3.80 for H. G. & H.

POULTRY AND GAME.—Prices are generally easier for dressed and not likely soon to advance. City killers manage to supply any deficiency that may occur.

Dressed turkeys, choice ₱ ℔ 13@14c.; coarse 12@13c; scalded, 11@12c.; Phila. Spring chickens 24@30c; New Jersey, 23@25c; fowls, Phila. d.-p. 13@14c.; N. J. d.p. 13@14c.; do. scalded 12@13c. State and Western 12@12½c; do. d.p. 12½@13c.; coarse 10½@11c.; Ducks, Spring, 18@24c.; old 12@13c.; Squabs, white, ₱ doz. $2.25@2.50 do. dark, $1.25@1.50

Live fowls in fair demand. Chickens lower with a heavy supply. Turkeys too low in quality to sell. Ducks continue cheap.

Spring chickens prime ₱ ℔ 20@22c.; other 16@18c. Fowls, ₱ ℔. 11@12½c; roosters, 5@6c.; turkeys, 9@10c.; ducks, ₱ pair 60@70c.; geese, extra $1.50; other 75c@$1.37 pigeons, 25@40c.

Eng. snipe and plover ₱ doz. $2.25@2.50. Wild pigeons scarce. A good many pigeons are expected from the shooting match next week. About 1,600 birds were all that could be obtained.

PROVISIONS.—The entire list is devoid of interest this week; sales for use have been small and exports have been very moderate. The only strength imparted to prices is through the speculative combinations.

Pork extra prime $14.50 ₱ bbl.; Western mess new $17.00; old $16.50. Lard—Western steam $11.22½ per 100 lbs.; prime city $10.95. Hams smoked city 11½@11¾c.; pickled Western 10¾@11c; shoulders, smoked city 8¼c; pickled 7¾c. Bacon long clear 8¾c. Beef family ₱ bbl. $13.50@14; India tes, $22@25, beef hams $ 3@23.50.

Receipts for week, beef, bbls. and tcs. 8 0. pork,, bbls. 1,359; cut-meats, pkgs, 11 8.8; lard: do. 26,200.

Exports for week, beef, bbls. and tcs., 1,900; pork do. 4,300; cut-meats, lbs. 3,085,293: lard, do. 2,494,248.

TOBACCO.—A fair business is reported.

VEGETABLES.—New potatoes are tending downwards under liberal prospective supplies, especially from Norfolk. Old steady for very choice. Very little of Southern find a steady place now that a few Northern points are shipping.

Bermuda potatoes new, $5.50 Chas. and Sav., $2@3; Norfolk, $2@3.50; do. culls, 75c.@$1; best old rose in double heads, $2@2.50; do. peachblow and snowflake, $2.25@2.50, other sorts, $1 50@2. Green peas, L. I., ₱ box, $1.50; N. J. per bbl. $2; wax beans, Norfolk, ₱ crate, 75c @$1; string beans do. 75c@$1; squash do., 75c.@$1; do. N. C. 50@62c.; cucumbers, Chas. and Sav. 25@50c.; cabbages, L. I., ₱ 100, $3@3.50; do. Norfolk, Norfolk 50c.@$1; beets, ₱ 100 bchs., $2@3; carrots do., $1.50; radishes do., 50@75c; rhubarb do, $1; white turnips do., $1.50@2, onions, ₱ crate, $1@1.10; lettuce ₱ bbl., 50c.; asparagus, ₱ doz., $.@2; cauliflower, ₱ doz., $1@1.50,

WOOL.—There is a strong but somewhat excited feeling in wool. Prices are again higher, with known large Western clips nearly due. The feeling in the country is also strong. California and Texas wool has had a liberal sale.

Ohio, Penn, and W. Va. XXX and picklock, 43@45c.; X to XX, 40@42c.; No. 2 to No. 1, 40@45c. coarse, 34@ 38c.; combing 40@45.

State and Western X and XX, 38@40c.; No. 2 to No. 1 38@44c.; coarse 32@36c.; comoing, 40@41c.; combing unwashed 28@33c.

Va., W. Va. and Md. unwashed medium 27@30c.; Ga. and Lake unwashed medium 27@30c.; coarse 23@26c; burry and slightly burry 16@22c; Cal, Spring northern, free, 30@34c.; middle counties, free, 27@30c.; southern, 23@27c.; low grade and burry, 18@23c.; Fall, choice, 24@25c.; low grade and burry 18@20c. Texas choice, free, 28@32c.; fair to good, 24@26c.; low grade and burry 17@20c. Pulled super 39@43c.; extra 36@40c; No. 1, 20@23c; combing, 38@41c.; lambs, 38@43c. Tub washed, fair to choice, 35@44c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, June 18, 1881.

BEEVES.—Receipts for the week 12,542 head; do. last week 13,461 do. Supplies for the close of the week were very heavy and the market proved weak under a slack trade. The sales included a car-load of light through Cherokee cattle at 8½c., to dress 51 ℔; 10 car-loads of very fine corn-fed Texans at 10¾@11¼c., to dress 56 ℔; 37 cars of Colorado and native distillery-fed cattle at 9¾@11¼c., to dress 56@57 ℔; and the range for very poor to choice corn-fed was from 8½c., to dress 51 ℔, to 12c, to dress 57 ℔.

MILCH COWS.—Very few good cows have arrived. The bulk of the sales have been at $30@45 per head. Good have been asked for at $55@60 per head.

VEAL CALVES.—Have sold briskly all the week helped by cool weather. Prices at the moment are strong, but a few warm days would weaken quotations.

Prime N.J. fed, 7¾@7¾c do. State, 7¾@7¼c.; poor to good yard lots, 5¾@7c.; Mt. Hollys, 7@8c.; buttermilks, 4½@5c; up-river dressed, 10@12c. Our quotations include West Washington Market stock.

SHEEP AND LAMBS.—Receipts for the week 34,824 head; do. last week 29,304 do. There was only a light trade in sheep at 4¾@5¾c; Va., Ky., and State lambs 6¾@7¾c; N. J. 9@9½c.

SWINE.—Receipts for the week 26,773 head do. last week, 30,382. Market very quiet; the nominal price for corn fed $5.90@6.10 per 100. City dressed State, 7¾@8½c.; do. Western, 7½c.

The FEARLESS.

VICTORIES UNEQUALED.

Is the only machine that received an award on both Horse-power and Threshar and Cleaner, at the Centennial Exhibition; was awarded the two last Gold Medals given by the New York State Agricultural Society on Horse-powers and Threshers; and is the only Thresher selected from the vast number built in the United States, for illustration and description in "Appleton's Cyclopedia of Applied Mechanics," recently published, thus adopting it as the standard machine of this country. Catalogue sent free. Address MINARD HARDER, Cobleskill, Schoharie Co., N.Y.

The Literary Revolution.

To keep in good humor the good people who delight in good books; to wake up the slow booksellers who are inclined to go to sleep in the summer, instead of, like a 'possum, in the winter; and to prevent our friends, the book publishers, from forgetting us, we have concluded to publish a few more cheap books. If we are to name him at all, we must, of course, head the list with the immortal Shakespeare, and will give you either his "Merchant of Venice" or "Hamlet," or any one of his fourteen other principal plays, in beautiful type, for 5 cents. At the same price you may have Macaulay's "Life of Frederick the Great," former price $1.25, or Carlyle's "Robert Burns," or Lamartine's "Life of Mary Queen of Scots," or Thomas Hughes's "Manliness of Christ," Washington Irving's wonderful, delightful, heretofore inaccessible "Sketch Book," which contains the incomparable Rip Van Winkle, you can have for a dime. For the same price we will give you "Tom Brown at Rugby," the best boy's book ever written, except "Robinson Crusoe," which you can have also for 10 cents. To charm those who delight in fiction, we give also for 10 cents each, Cooper's "Last of the Mohicans," one of the most justly celebrated American novels, and Charles Kingsley's "Hypatia," which worthily ranks at the very front of famous historical fiction. These are only specimens of the cheap books we publish, are all in good type, neatly printed, and are not in the broad side or any other "side" or "square" style, but handy pocket volumes, of course in paper binding. Our motto, however, has always been that a book worth reading is worth preserving, as well as worth owning, and our large list of standard books, to which we are making additions, with speed unprecedented in the history of publishing, are all elegantly and strongly bound, in cloth or better style, and sold at prices proportionately low with those in paper covers. We issue these few only in pamphlet form, as specimens of the quality of our good literature, and these special terms will not be long continued throughout the United States and Canada are prepared to either abundantly supply or liberally slander our publications. We give liberal terms to clubs where no bookseller acts as agent. Descriptive Catalogue, and illustrated pamphlet describing book-making and type-setting by steam, will be sent free, on request. Cheap Books. Three Cents. Washington Irving. A Dime. Tom Brown Crusoe. Cooper's Mohicans. AMERICAN BOOK EXCHANGE, 764 Broadway, New York. JOHN B. ALDEN, Manager.

CLARK & CO., SOMANAUK, ILL.

GRAND SUMMER OFFER

14 Pieces of Choice Sheet Music, Four Handsome Engravings, Ten Perforated Card Board Mottoes, and a 16-Page Illustrated Family Paper Six Months—all for 27 cents! For the purpose of extending our subscription list, we make the following unparalleled offer: Upon receipt of 27 cents in postage stamps we will send The People's Home Journal for Six Months, and to every subscriber we will send Free, all the following valuable premiums: Fourteen New and Popular Ballads, with words and music all complete; the entire fourteen pieces are bound in a neat book with handsome cover, and form one of the most valuable collections of choice music ever published. Four Large and Elegant Engravings, entitled respectively "Under the Lindens," "Cupid and Psyche," "The Three Friends," and "Origin of the Harp"—all beautiful subjects; the engravings are reproductions from steel plates, handsomely printed upon heavy paper, and are far superior to chromos or other cheap pictures. Ten Handsome Perforated Card Board Mottoes, very pretty and useful for working with worsted or silk into book-marks and other souvenirs; they make very desirable presents for friends or relatives. Remember, we send all the above, together with THE PEOPLE'S HOME JOURNAL six months, for only 27 cents. THE PEOPLE'S HOME JOURNAL is a 16-page, 48-column illustrated literary and family paper, filled with charming Stories, Sketches, Poems, Useful Knowledge, Wit and Humor, Household Recipes, etc. All will be delighted with the paper and premiums, and we guarantee fully three times the value of money sent. This great offer is good only till October 1st; therefore, send at once and get the benefit of it. It is the most liberal offer ever made by a reliable house. All orders filled by return mail. Money refunded to all who are not perfectly satisfied. For 2 subscribers and 54 cents we will give a splendid Harmonica or a large Box of Paints; for 3 subscribers and 81 cents we will give an elegant Silver-Plated Butter Knife or Fruit Knife; for 4 subscribers and $1.08 we will give a valuable 2-blade, bone-handle Pocket Knife, or a handsome Gold-Plated Pencil, or a set of elegant Gold-Plated Sleeve Buttons. Your own subscription can count as one towards the club, and each subscriber will get the paper six months and all the premiums. Show this advertisement among your friends, and get a small club, and so win one or more of these extra premiums. Address, F. M. LUPTON, 27 Park Place, New York.

Send us your address on a postal card for further particulars. LOVELL WASHER CO., Erie, Pa.

News of the Week.

ANNOUNCEMENT.

I HOPE the young folks will bear with composure, the omission of the Youth's Department this week. Our crop reports demand all available space, forcing the "News" upon our page. Next week the usual order will be resumed. U. M.

HOME NEWS.

There are no particularly new developments at Albany as yet in the Senatorial contest. No election has taken place, and there are not many signs of such an event. The investigating committee are engaged in seeking out the guilty party in the bribery case, but have not yet "found the man."

A young Choctaw from Indian Territory took the first prize in oratory at Roanoke College, Va., at the last commencement.

The village of Ludington, situated on Lake Michigan at the terminus of the Flint and Pere Marquette Railway has been nearly destroyed by fire.

Cyclones have been in order in the West during the past week. In Northwestern Missouri no less than three "twisters" dealt death and destruction in as many paths. Near King City 50 persons were killed, besides hundreds of cattle, sheep etc. One man lost 80 cattle, another 60 sheep, another seven horses. At Topeka, Kansas, similar losses are reported. The Western country has had its share of snow-drifts, floods and cyclones for the last few months.

At a meeting of the corporation of Brown University Providence, R. I., Professor W. H. Russel acting President of Cornell University, was appointed acting professor of History and Political Economy in place of Prof. Diman recently deceased. W. W. Bailey was made professor of botany.

The Hon. J. A. Bentley, Commissioner of Pensions, tendered his resignation at the President's request on the 16th inst., and W. W. Dudley was at once appointed in his stead.

Boston and suburban towns celebrated the anniversary of the battle of Bunker Hill on the 17th inst. Hon. Robt. C. Winthrop delivered the oration, and at one point in his address, displayed the sword worn by Col. Prescott at the battle.

The grand jury which will pass upon the papers in the Star route cases was drawn at Washington, D. C., last week. It is believed to be a jury which will consider honestly and fairly all the evidence. It is not known exactly when the evidence will be laid before the jury. The Attorney-General keeps his purposes entirely secret. The Star route people realize that Mr. MacVeagh is in earnest, and there is little hope that his hand will be stayed. It is believed that evidence has been obtained to justify immediate action by the grand jury in the cases of some of the thieves. It is also said that some of them are expected to offer to give evidence in order to save themselves.

In the Southern States, which have 138 electoral votes, nearly 45 per cent. of the voters cannot read and write. In South Carolina 64 per cent. of the voters are illiterate. These figures speak loudly in favor of some more general system of education for the South.

Governor St. John of Kansas claims that the prohibitory law of that State is wonderfully successful. Topeka, with a population of 20,000, has not a single saloon, and has had only one case of drunkenness since the law went into effect. An inebriate took an overdose of patent bitters, and the man who sold the "medicine" was fined $100. There are no open saloons outside of Leavenworth and Atchison, and these are under prosecution. The Governor's letter was written before the recent judicial decision shaking the constitutionality of the law was rendered.

The house of Washington Irving, two miles south of Tarrytown, N. Y., is greatly out of repair, but it is said the library is exactly as he left it. Even his pen is on the table where he laid it down for the last time, and his papers as he had arranged them on his desk; they have never been disturbed.

An intermarriage between a Chinaman named Lee Chin, and a white woman, Mrs. Eva H. Lee, has attracted much attention at Cheyenne, Wy. The statutes of Wyoming forbid such intermarriage, and the couple had the ceremony performed in Denver, Col. Mr. and Mrs. Lee Chin have been indicted for miscegenation. The Chinese consul at Denver, under direction of the Chinese Ambassador at Washington, contested the case in the courts. The court held, that the marriage being legal in Colorado, it was also legal in Wyoming. The defendants were finally discharged.

The steamer Dessoug, in which Commander Gorringe brought the obelisk from Egypt to America, has been purchased from Mr. William H. Vanderbilt by the Southern Transportation Company for $58,000. It is now being altered and rebuilt and is intended for the New York and Savannah cotton trade. The vessel was built in England, and was for many years used as a trader before the Khedive of Egypt bought and converted it into a private yacht.

Nevada has enacted a law designed to prevent opium smoking, which makes the possession of opium or of an opium pipe a misdemeanor, punishable by fine or imprisonment. This statute is very obnoxious to the Chinese Six Companies of San Francisco, and interferes with their profits; and they have retained three leading lawyers, two of California and one of Nevada, to test the validity of the law, and, if necessary, to carry the question to the United States Supreme Court.

The State of Missouri asked for bids for a loan the other day. On opening them it was discovered that more money had been offered at three per cent than was needed. The credit of the Union ought to be as good as that of Missouri.

Wealthy citizens of Chicago have organized a Chicago Musical Festival Association, on the plan of a similar body in the City of New York. N. K. Fairbank was elected President and Theodore Thomas Musical Director. Biennial festivals are to be given, beginning in June, 1882.

A Blessing to Humanity.

A lady residing in Georgia, whose son was threatened with consumption, wrote to one of our old patients, Mrs. M. T. Piersol, of No. 1636 Wallace Street, Philadelphia, asking if a testimonial in favor of Compound Oxygen, to which she saw her name attached, was genuine, and received the following reply: "Yours just received. It is my privilege to say in reply to your inquiry about the Compound Oxygen Treatment, that it is all that it claims to be, and in some cases has exceeded its promise. My testimonial is genuine, and I am always glad of the opportunity to give my voice in favor of so *great a blessing to humanity*. As to your son's case, I would say, persevere by all means. I think he has everything to expect; of course I cannot judge intelligently for him; but he can rely with all confidence upon Dr. Starkey's word. *I have known him for years. He is an intelligent and faithful physician* and a true man. I would advise you to keep him posted, and follow his directions strictly." Our Treatise on Compound Oxygen, containing large reports of cases and full information, sent free. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

The London Wool and Textile Fabrics, of May 28, states that reports on the progress of the European silk crops contain little of decided character. No complaints are heard in France. A few isolated cases of dissatisfaction are reported in Italy, but so far no serious damage has been done. It is now regarded as assured that the crop in Spain will be slightly larger than last year. In the Levant, prospects are good. The reports from China are rather contradictory, but it is now thought that the yield will equal last year's. In Japan the development of the worms has been retarded. Meanwhile, the continental markets continued quiet and easy, prices being about two to three per cent lower than at the beginning of April..... On the 2d inst., the opening of the International Woolen Exhibtion, at Crystal Palace, London, was announced. This enterprise is one of a series intended to be devoted to special classes of important manufacturing industries calculated to promote British trade, commerce and manufactures, and also advance the interests of technical education. It is stated that there were to be more than two hundred separate woolen exhibits, and that large spaces had been reserved for the colonies of South Australia, New Zealand, Victoria and New South Wales. Fine samples were to be shown also from Uruguay, Buenos Ayres, Iceland, and the Falkland Islands. Every kind of fabric into which wool enters was to be represented, together with carpets from Cashmere, Smyrna, Morocco and other well known seats of the industry, beside dye stuffs, oils, soaps and other chemical substances used in woolen factories. Of about sixty foreign exhibitors entered, thirty-four were from Germany and eight from Holland, the rest being from Russia, Austria, France, Belgium, Denmark and the Argentine Republic.....

Russian immigrants in Minnesota escaped the trouble of coal famine by burning prairie hay in their air-tight, Old Country, brick-lined stoves..... Whatever doubts may exist as to the practical value to this country of the visits of M. Leon Chotteau, the French commercial agent, there will be a general and hearty appreciation of his sensible address before the St. Louis Merchants' Exchange on Wednesday last, in which he declared that the decree forbidding the importation of American pork into France was utterly without reason and an act of injustice to both countries. M. Chotteau quoted figures to prove that the loss to the United States since the decree was issued on February 18, had been about $2,400,000 and that the injury to the laboring classes of France, who are the principal consumers of this exported food, has been correspondingly serious. In conclusion, he expressed the hope that Secretary Blaine would soon succeed in getting the French Government to listen to sound reason. The Merchants' Exchange will forward M. Chotteau's manuscript to the State Department as a valuable defence of American pork and a forcible exposition of the whole question....

A FINE HAIR DRESSING.

Cocoaine dresses the hair perfectly, and is also a preparation unequalled for the eradication of dandruff.

THE superiority of **Burnett's Flavoring Extracts** consists in their purity and great strength.

Women that have been pronounced incurable by the best physicians in the country, have been completely cured of female weakness, by the use of Lydia E. Pinkham's Vegetable Compound. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 50 cents per box.

There is scarcely a person to be found who will not be greatly benefitted by a thorough course of Kidney-Wort every Spring. If you cannot prepare the dry buy the liquid. It has the same effect.—Palladium.

Miscellaneous.

THE CYCLOPÆDIA WAR.

The month of July, 1881, witnesses the completion of the larges and most important literary work this country and the century have seen. It is the Library of Universal Knowledge, large type edition in 15 large octavo volumes, containg 10 per cent. more matter than Appleton's Cyclopædia, at less than one-fifth its cost, and 20 per cent. more than Johnson's Cyclopædia, at a little more than one-fourth its cost.

Chambers's Encyclopædia, which forms the basis of the Library of Universal Knowledge (the last London edition of 1880 being reprinted verbatim as a portion of its contents), is the laborious product of the ripest British and European scholarship. It has developed through a century of Cyclopædia making, its various editions having been many times revised, in successive years, till it has come to be universally recognized, by those competent to judge, as standing at the very front of great aggregations of knowledge, and better adapted than any other Cyclopædia for popular use. It contains such full and important information as the ordinary reader, or the careful student, is likely to seek, upon about 2,500 subjects, in every department of human knowledge. Chambers's Encyclopædia, however, is a foreign production, edited and published for a foreign market, and could not be expected to give as much prominence to American topics as American readers might desire. To supply these and other deficiencies a large corps of American editors and writers have added important articles upon about 15,000 topics, covering the entire field of human knowledge, bringing the whole number of titles under one alphabetical arrangement to about 40,000. Thus the work is thoroughly Americanized, and the Library of Universal Knowledge becomes at once the latest and most complete Encyclopædia in the field, at a mere fraction of the cost of any similar work which has preceded it.

Victory **For The** **Revolution**

Price of the 15 volumes, complete, in extra cloth binding, $15.00. In half Russia, sprinkled edges, $20 00. In half Russia, gilt top, $22 50. In full library sheep, marbled edges, $25.00.

The superlative value and importance of this great Encyclopædia lies especially in the fact that is is brought within the reach of every one who aspires after knowledge and culture. It is *really* a library of universal knowledge. It brings a liberal education easily within the reach even of every plowboy of the country and apprentice boy of the city. Every farmer and every mechanic in the land owes it to himself and to his children that such a Cyclopædia shall henceforward form a part of the outfit of his home. To the professional man, and every person of intelligence in every walk of life, a Cyclopædia is *a necessity*.

Of course the old and wealthy publishers who have grown rich (it is said that the Appletons have made a profit of nearly two million dollars on their Cyclopædia) from the sale of their high-priced publications are not pleased that their monopolies are broken and their power overthrown. Of course the book agents and booksellers who have been used to getting from 40 to 60 per cent. commission for selling these high-priced books are not so well pleased to sell the Library of Universal Knowledge on 15 per cent. commission, though those who are not short-sighted discover that their own interests, after all, are identical with the interests of *the people*, and their real profits, in the end, are increased, by the immense sales which result from meeting the people's wants. The majority of booksellers, however, are better pleased to *slander* than to *sell* this and our numerous other standard and incomparably low-priced publications. But the Literary Revolution has always looked to *the people*, in whose interest it is, for its patronage, and it has never looked in vain, as our more than one million volumes printed last year (this year being increased to probably more than two millions) abundantly prove. You can order the Cyclopædias directly from us, and by uniting with your neighbors and friends you can secure club rates as follows:

$10,000 Reward **To Club Agents.**

A discount of 10 per cent will be allowed to any one ordering at one time three or more sets of the Cyclopædia; and a discount of 15 per cent. will be allowed to any one ordering five or more sets at one time.

As a special inducement to our friends and patrons to go to work *promptly* and *vigorously*, each doing what he can for the dissemination of universal knowledge, we propose to distribute $10,000 in special premiums as follows, in addition to the regular discount to clubs:

$5,000 Reward to be distributed equally among the first 500 club agents who send us clubs of not less than five subscribers, after June 15th and before September 1st,
$5,000 Reward in addition to the first $5,000 to be distributed among the 100 club agents who, during the same time, send to us the *largest number of subscribers*, not less than twenty in number the amount to be distributed proportionately to the whole number of subscribers which each of the 100 club agents may send us.

The names of the subscribers must in every case be forwarded to us. The first $5,000 named will be distributed as specified as rapidly as the orders are received, and the remaining $5,000 will be distributed promptly on Sept. 1st. The names of the persons receiving these rewards will be printed, with the amounts received by each, and the list sent to all the club agents entering into competition for them. Subscribers must be *actual purchasers for individual use*, to entitle the club agent to the rewards under this offer, and not booksellers or agents who buy to sell again.

Persons desiring to raise clubs may send to us at once for sample volumes, if they desire, in the various styles of binding, paying us 75 cents for the volume in cloth, $1.00 for the volume in half Russia, sprinkled edges, and $1.25 for the volume in library sheep. Orders for the full sets will be filled by us with the utmost promptness, within our ability to manufacture, beginning not later than July 10th, orders being filled in the order of their receipt by us.

Specimen pages of the "Library of Universal Knowledge" will be sent free upon request. Descriptive catalogue of our large list of standard publications, with terms to clubs, and illustrated pamphlet describing book-making and type setting by steam, will be sent upon application. Remit by bank draft, money order, registered letter, or by express. Fractions of $1.00 may be sent in postage-stamps.

AMERICAN BOOK EXCHANGE,

JOHN B. ALDEN, MANAGER. 764 Broadway, New York.

Steel Barb Wire.

GALVANIZED or PAINTED.

15 FEET TO THE POUND.

The use of Barbed Wire for Fencing is no longer an experiment, but an acknowledged necessity, as over *one hundred thousand miles* of it were put up last year, and we confidently expect twice the quantity will be used this year, there being no other material anywhere near as cheap, lasting, and effective.

CIRCULARS and SAMPLES by MAIL to any part of the World.

CANNOT BE INJURED BY FIRE, WIND, OR WATER

IT DOES NOT INJURE CATTLE.

PERSONAL ITEMS.

General Beauregard is writing a history of the war.

Senator Fair is going to erect a $1,000,000 building in San Francisco.

Delegate Pettigrew, of Dakota, has a scheme to cut that big Territory up into two States.

"The United States is a this, not a these," said President Moss, of the Indiana University.

Ex-Senator William Pinkney Whyte has decided to accept the Democratic Mayoralty nomination of Baltimore.

General Robert Toombs, speaking of the Bible revision, said: "They have killed the devil and knocked the bottom out of hell."

Ex-Governor Hubbard, of Texas, says that 200,000 immigrants will locate and 2,000 miles of railtrack be laid in that State this year.

Prince Bismarck's indisposition compels him to continue restricting his labors to a minimum and to perform them in a recumbent position.

Secretary Hunt doesn't like being considered as "junketing" at government expense, and so he pays his personal expenses when on trips in the government service.

The Centennial of the birth of George Stephenson, the originator of railway locomotion, was celebrated the other day in various parts of England, the chief observance being at Newcastle-on-Tyne. The occasion was also celebrated among railway employes in various parts of the continent.

President Barnard, of Columbia College, in his address to the graduating class the other day, made a strong appeal to the young men who are just entering on life to use their best efforts for the extirpation of the abuse known as the "spoils system," which he said was eating out the vitals of the Republic.

[Wilmington, (Del.) Daily Republican.]

Mrs. Adam Grubb, 231 Walnut street, has been a great sufferer for a number of years from extreme pain in the feet, something like rheumatism. She was also very much troubled with corns and bunions. It was with great difficulty that she could walk, and sometimes when she would visit her husband's shoe store or any of her children, she could not get home again without assistance, and often when she was walking along the streets she would be seized with such acute pain that she was compelled to stop in at the neighbors on the way until she got better. Some two weeks ago she heard of the wonderful cures St. Jacobs Oil was effecting, and she at once commenced to use it and experienced great relief immediately. The pains have left her feet and ankles and the inflamation has left her corns and bunions. She is now tripping up to her husband's shoe store and out to see her children without experiencing any pain.—*Adv.*

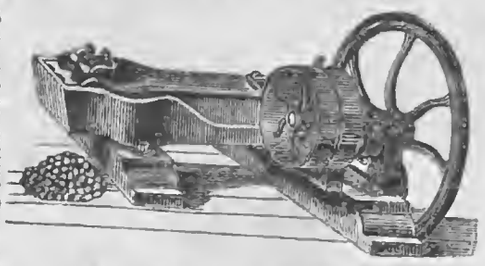
Implements and Machinery.

CHEAPEST AND BEST FERTILIZER---FOLLOW NATURE.



Which USES GROUND RAW LIMESTONE in MAKING THE SOIL. There were no Lime Kilns around burning lime when the good **Limestone Farming lands** were originally made. Every Farmer can prepare his own Fertilizer with an **ordinary Horse Power** by using **FORSTER'S COMBINED CRUSHER & PULVERIZER,** which takes a lump of Limestone three to five inches square, and Crushes and Pulverizes it in **one operation,** same as Burr's. Farmers use the Ground Raw Limestone, and drill and sow it just as it comes from the machine. W. W. Reed, of Erie, has tried it 6 years, and says it shows a profit over Bone Dust of $1.98 per acre; over Phosphate of $4.28 per acre; over Guano of $9 70 per acre; over Salt of $5.90 per acre, **and that it will last twice as long."**—John G. Bear, of Montgomery, Lycoming Co., says: "I believe it to be the cheapest and best Fertilizer in this country. *It is worth three times as much as Burnt Lime, and with this machine does not cost half as much as Burnt Lime to make."*—H. C. Falls, New Castle, Pa., says: "I used the Ground Limestone last year with great satisfaction as to results, and cannot too strongly recommend it for farm and garden purposes Where I dropped my corn on top of it, the corn came up first, and was strong and thrifty—the Limestone drawing the moisture to the roots. Used in place of Paris green on Potatoes, it kept the Bugs away and made the plants thrifty and strong; being washed into the ground, it benefited the Potatoes in an astonishing manner. Address only
TOTTEN & CO., Pittsburgh, Pa. ONLY MAKERS.

NEW BUCKEYE PLOW SULKY.

IMPROVED FOR 1881.
CAN BE ATTACHED TO ANY PLOW
The **New Buckeye Plow Sulky** has many improvements not found in any other. It is simple in construction, is strong and durable, and easily operated by man or boy. It is easily attached to any common Plow with wood or iron beam. It has a convenient adjusting lever with which the plow is made to run level on uneven ground. The Lifting Lever is easily operated, and the depth can be regulated or the Plow raised entirely out of the ground without stopping the team.
It is arranged for either two or three horses, and will turn a square corner without raising the Plow. It is the best Plow Sulky in the market, and contains advantages not found in any other.

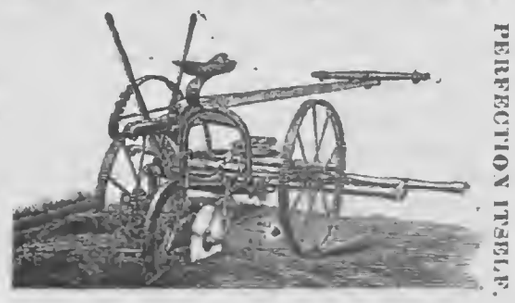
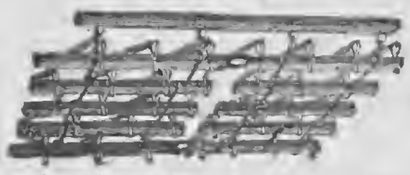
CHAMPION SULKY PLOW



THE MODEL PLOW. PERFECTION ITSELF.
A PLOW OF GREAT STRENGTH.
Simplicity, Durability and Ease of Operation. Adapted for use everywhere. Circulars giving full information free. Address J. LANE REED & CO.,
(Sole Manufacturers,) DAYTON, OHIO.

THE VIBRATOR HARROW.



Best Harrow made. Cuts every Inch of ground, & adapted to all kinds of soil. Peculiar shape of tooth makes it easy of draft and leaves the ground light and mellow. Relieves itself of all obstructions. Bundled very compact for shipment. 3 sizes cut 6, 8, and 10 ft. Agents wanted. Write for Circulars to
PHELPS & BIGELOW WIND MILL Co.,
Kalamazoo, Michigan.

Hull Vapor Cook Stove

The only Vapor Cook Stove that has stood the test of years, and given entire and perfect satisfaction.
50,000
Now in use, and growing in favor wherever used.
For Summer Use they are Indispensable.
Our "Patent Automatic Safety Can" renders the use of our stoves "perfectly safe" in the hands of the most careless or inexperienced.
Send for full descriptive circular and price list. Special inducements to agents in unoccupied territory.
Address HULL VAPOR STOVE CO.,
CLEVELAND, OHIO.

$72 a week, $13 a day at home easily made. Costly outfit free. Address True & Co., Augusta, Maine.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

PARENTAL APPROBATION.

Mr. Bow-Wow.—"Very good; very good, indeed! Go on with chickens a few days longer, and then I think I may put you on rats."

Humorous.

MEN are geese, women are ducks, and birds of a feather flock together.

WE have seen Spring bonnets with sixteen full-blown poppies on them. The young ladies poppies have to pay dearly for them.

SCENE at the college—VIS. (to servant at the door): "Miss——?" Servant: "She's engaged:" VIS. "I know it; I'm what she's engaged to."—[College Journal.

"I THINK the goose has the advantage of you," said a landlady to an expert boarder, who was carving. "Guess it has, mum, in age," was the withering retort.

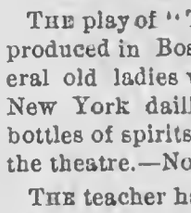
A GOOD many of the new stars and comets read about in the newspapers are discovered by men who come home late and meet the clothes-line across the bridge of their nose.

THE play of "The Streets of New York" was produced in Boston the other night, and several old ladies who are close readers of the New York dailies, supplied themselves with bottles of spirits of ammonia before going to the theatre.—Norristown Herald.

THE teacher had grown eloquent in picturing to his pupils the beauties of heaven, and he finally asked: "What kind of little boys go to heaven?" A lively four-year-old boy, with kicking boots, flourished his fist. "Well, you may answer," said the teacher. "Dead ones!" the little fellow shouted, at the extent of his lungs.

A WELL-KNOWN citizen of Chicago, last Sunday, went to church, carrying over his arm what he supposed was his new Spring overcoat, but was horrified when he got there to find that he was conspicuously transporting his new pair of Spring pantaloons. The package came home from the tailor late Saturday night, and the garment was hung over the balusters in the front hall.

COLUMBIA BICYCLE.



Bicycle riding is an accomplishment easily acquired, and is rapidly becoming the most popular of out-door sports; as a health restorative it is invaluable, bringing into action every muscle of the body, strengthening the lungs, and invigorating the wearied brain. The practicability of the machine is generally conceded throughout the country, and the thousands of bicycles in daily use are constantly increasing in number. Send 3c. stamp for catalogue, with price list and full information. THE POPE M'F'G CO.
595 Washington Street, Boston, Mass.

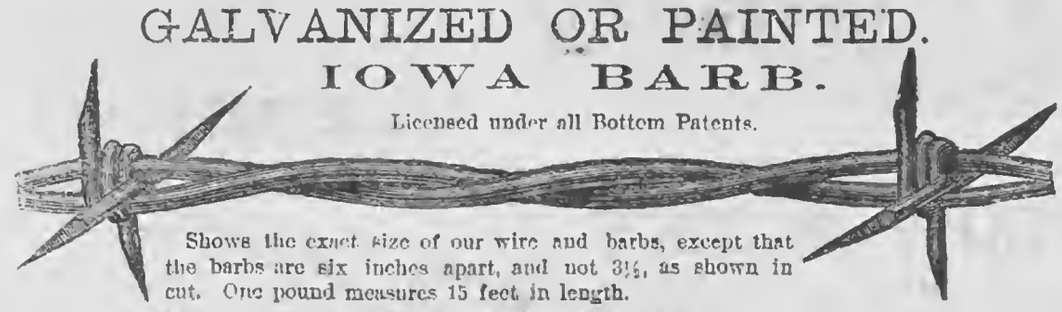
Steel Barb Wire Fencing.

GALVANIZED OR PAINTED.

IOWA BARB.

Licensed under all Bottom Patents.



Shows the exact size of our wire and barbs, except that the barbs are six inches apart, and not 3½, as shown in cut. One pound measures 15 feet in length.

Put up on spools of about 100 pounds.

The use of Barbed Wire for Fencing is no longer an experiment, but an acknowleged necessity, as over *one hundred thousand miles* of it were put up last year, and we confidently expect twice the quantity will be used this year, there being no other material anywhere near as cheap, lasting, or effective.

CANNOT BE INJURED BY FIRE, WIND OR WATER, AND WILL LAST A CENTURY.

IT DOES NOT INJURE CATTLE.

Estimating Wire at 12c. a lb. and Wood Posts at 10c. each, a Fence of Four Lines of Wire can be made for 60c. a rod, or with Galvanized Iron Posts, a Perfect and Everlasting Fence for One Dollar a Rod. Ask your Merchant for our Wire, or write to us direct.

We also manufacture STAPLES, POST-HOLE DIGGERS, WIRE STRETCHERS and CUTTERS, IRON POSTS, etc.

Circulars and Samples by Mail to any Part of the World.

THE CELEBRATED

EUREKA POST HOLE DIGGER.

Work done five times Quicker and Easier than by the old way. No Clogging. No Knee Work. No Back Ache. Price $3 50, delivered to any part of the United States.

Buy direct from the Manufacturers.

Sole Manufacturers East of Mississippi River.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XL.—No. 1640.} NEW YORK, JULY 2, 1881. {PRICE FIVE CENTS $2,00 PER YEAR.

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Horticultural.

THE PENDULOUS TREFOIL—(Desmodium Pendulæflorum.

S. PARSONS, JR.

ONE of the prettiest genera of the many hardy leguminous ornamental plants is that of the Desmodiums. Their fine, rich green foliage, waving habit and delicately tinted flowers are all more or less attractive. All the Desmodiums die down to some extent in Winter in the Middle and Eastern States of America, but the roots are seldom, if ever, killed, and as the flowers are borne late in Summer and therefore on wood produced the same year, this suffruticose peculiarity does not injure the value of the shrub for lawn-planting.

The Desmodium is one of the few plants that bloom in late Summer and Fall, and it has also a most gracefully pendent character peculiar to its refined and delicate foliage which is embroidered and tasseled with rosy-purple flowers resembling those of the sweet pea. On many accounts the Pendulous Trefoil finds its most appropriate position in the mixed border of hardy herbaceous plants and hardy shrubs. Its habit of weeping to the ground gives it peculiar value for the outskirts of shrub groups where erect-growing shrubs or even trees need a certain amount of masking to secure their most artistic effect. If this plant, however, had no other qualities of value than its beautiful and abundant August flowers, which last until frost, I should unquestionably predict for it a future of popularity; but endowed as it is with interesting foliage as well, it must certainly make its way into extended employment on the lawn.

THE PENDULOUS TREFOIL.—The specimen of the Pendulous Trefoil of which the portrait of a branch is here presented, was sent to us several years ago by Mr. John Saul among many novelties to be tested in the Rural Grounds. We find the roots entirely hardy, having withstood unharmed the past terrible Winter.

It comes, we believe, from Northern Asia, and at the Rural Grounds it attains a hight of about three feet, its slender branches, half covered with pea-shaped blossoms of extremely delicate shades of rose and violet, bending over gracefully on every side. It is a free grower, is suited in almost any soil or situation, and is readily propagated by cuttings.

PENDULOUS TREFOIL—From Life—Fig. 316.

HARDY SHRUBS AND PLANTS.

IN the RURAL NEW-YORKER for May 21, '81, page 340, I notice a few remarks concerning the injury done to plants and shrubs by the past Winter. As it was remarkably severe it afforded me an opportunity for testing the hardiness of many plants, and after many years' experience I find that a considerable number that are usually described and sold as hardy, are, when put to the test, found wanting in that desirable quality. A hardy plant, as I understand the term, is one that will stand our Winters without protection and sustain no injury, while one that requires protection and receives injury so as to damage its ornamental appearance or to destroy its flowering qualities, has no right to be called hardy—it is only half-hardy in the strict sense of the word, and should be described and sold as such.

I regret very much to hear of the damage done to the beautiful Japanese Maples, but I must say that I was always of the opinion that they would prove too tender for our severe climate. They may stand in some favored localities, but for general cultivation they will undoubtedly prove to be half-hardy plants.

I am sorry to have to report that the Lawton Blackberry is killed to the ground, and that the Kittatinny is so severely injured that it will only produce half a crop. The Cuthbert Raspberry has stood well, not a cane being injured. Hydrangea hortensis is, as usual, killed to the ground, and so is H. Otaksa; while H. Tho's. Hogg is dead—roots and all. As might have been expected, the Japanese Persimmon is killed to the ground, and so is that neat climber Akebia quinata. Euonymus Japonica and all its varieties are dead—roots and all; and so is the dwarf E. radicans variegata, and in my collection of Hybrid Perpetual Roses are to be found many vacancies. The Irish Juniper (Juniperus Hibernica) is badly injured, and in low places some plants are killed to the ground, while large specimens of the Irish Yew (Taxus fastigiata) over ten feet high, are killed half way down, and even the box—Buxus sempervirens—is severely injured, some specimens being dead over half way down. This has stood here many years without protection, and until the past Winter without injury, and, strange to say, small plants of the Thujopsis dolobrata variegata, or Japan Arborvitæ, are uninjured. A large specimen of the Cedrus Atlantica—Mt. Atlas Cedar—

over 25 feet high, is injured far beyond recovery, and the Rocky Mountain Silver Spruce is almost in the same condition.

I notice in some catalogues that Azalea amœna is described as hardy. It may be so in some localities, but not here. After repeated trials I have never been successful in obtaining one single plant that could survive our Winters. Weigela nana variegata is a shrub that deserves a prominent place in all collections, however small. It is of dwarf, spreading, but compact, growth, and is perfectly hardy and free from the attacks of all insects. In June it is a mass of rose-colored flowers. Added to this, its leaves possess a clearly defined bright golden variegation which is retained throughout the entire Summer. It stands our Summer sun well, and is the very best deciduous shrub with variegated foliage.

Queens Co., L. I. C. E PARNELL.

NOTES FROM THE RURAL GROUNDS.

Grapes.

THE damage sustained by grape-vines during the past Winter is now more apparent than when, a few weeks ago, we first alluded to the subject. Of Mr. Ricketts's seedlings, Lady Washington, as before stated, was killed nearly to the ground. From one bud a vigorous shoot is growing bearing two bunches of fruit buds. Highland was killed to the ground—Eldorado within a few inches of the ground. That marked 240 A, and not as yet, we believe, offered for sale, was killed back a joint or so, though the plant is but two years old and was slightly protected. Newburgh was killed to the ground. Jefferson, like the last mentioned, was protected somewhat and not seriously harmed. Highland is dead above the present shoots which start just above the roots. The same may be said of Imperial and Quassaic. The now well-known grape, Lady, originating with Mr. Campbell, shows injury on a few of last year's canes. Cottage, a two-year-old vine, was killed to the ground. Of Rogers's seedlings, Goethe (No. 1) was killed to the ground, one shoot from the neck alone appearing. Wilder was less harmed than any of the Rogers's. All the young wood of Salem was killed. It will surprise many of our readers to know that of all our grapes—and we have no less than 50 different kinds—the Victoria, one of the late Mr. Miner's seedlings, is the *only one which escaped injury entirely*. It is growing from every bud, while the many bunches of blossoms it bears give promise of a good crop of grapes, though it bore well last year. This is a white grape, a seedling of the Concord, which the RURAL has kept before its readers for a number of years. Mr. Miner's Carlotta, Rockingham and Augusta, also harmed very little, are all in blossom. Lexington was injured. All of these, as often before stated, are pure Concord seedlings. Our Kittatinny blackberries were every one injured; many killed to the ground. Of all our blackberries Snyder is the only variety not hurt.

The Japan Maples.

After all the praise that the RURAL has given these little gems for the past five years, it was an ungracious task to be obliged to tell our readers how sadly the past Winter has robbed them of their claims to being considered hardy. We find that Acer palmatum or polymorphum which we said was killed to the ground, is killed outright—roots and all. This seems to us inexplicable for the reason that this is the stock upon which the many varieties of the Japan Maples are worked. Perhaps the death of the A. palmatum is due to some other cause besides the severity of the Winter. In fact, either this must be accepted as the case or it must be supposed that it is rendered hardier by the varieties worked upon it, since the latter, though badly injured, are in no case killed.

The Cut-leaved Maple (Acer dissectum), a variety of the Norway, is really one of the finest of maples for ornamental grounds. Its leaves are deeply and peculiarly cut; of a dark green when mature, while the young leaves are as purple as those of the Schwerdler's maple.

Wistaria as a Standard.

Years ago we commenced to train a Chinese Wistaria into a standard. Year after year until last year it was laid down and covered. It had become a beautiful little tree four feet high with a stem six inches in circumference. It was not thought necessary to lay it down again for last Winter, especially as the stem had become so thick that we feared it might be broken or warped. This little tree to which we had given so much time and care, is now killed to the roots,

Among other plants we note with regret that the Plicate-leaved Viburnum, the handsomest of the viburnums, is killed to within a few inches of the ground. The Japan Akebia (quinata), which has been reported as not hardy in milder climates, is not harmed in the least here.

Strawberry Notes taken June 10.

The wet weather and the cloudy skies have insured a bountiful strawberry crop, though the fruit is not so sweet and is more perishable.

Among about 100 different varieties we make the following notes:—

DUCHESS has again been the first to bloom and to ripen berries. It is of poor quality, medium size, but quite productive.

WARREN is now ripening. It is of good quality and size—the plants vigorous, but not productive.

HERVEY DAVIS is prolific; of good quality, firm and promising.

GRACE—Not prolific.

FINCH'S SEEDLING (not French's) is prolific and vigorous. Firm—medium quality; ripening.

CAROLINE—Small berries and unproductive.

PRES. LINCOLN for some reason fails with us this year. It appears old beds of this variety never do well.

SHARPLESS.—Again we have to report most favorably upon this variety. Other kinds are more productive, perhaps, but we have no other kind which so well combines vigor, size of berry, quality and productiveness.

ENWOOD'S GLOBE is small, good flavor, not very vigorous.

IOWA PROLIFIC is full of fruit, which begins to ripen later. The vines are vigorous. Soft and sour.

EMMA'S FAVORITE has long, erect leaf-stalks. Many berries have set. It is a late kind. Mr. J. H. Hale says it is Kentucky. So says Mr. E. P. Roe.

GARDEN is of a brilliant red color, good quality, quite firm. Plant not very vigorous.

HELLEN is prolific. The berries are medium in size, soft and of low quality. Foliage burns in hot weather.

AMERICA bears small berries, which rest upon the ground. The plants are strong-growing.

ROMEYN'S SEEDLING is of fair quality—not productive. Mr. Roe thinks it is Triumphe de Gand.

FRANKLIN (it was labeled Franklyn) is full of green berries. We counted 300 on a single plant.

MILLER'S No. 5.—Very prolific—large size. Is ripening now. Soft.

KISSANY bears shapely, bright-red berries. It promises to be prolific. The vines are vigorous.

No. 1 (Roe).—Very prolific—often cockscombed. Vigorous vines. None ripening yet.

MILLER'S No. 7.—Dark red when ripe. Good quality, prolific, vigorous.

ENDICOTT'S SEEDLING.—Large berries, prolific—not yet ripe. Mr. Roe believes this to be Seth Boyden.

MEMPHIS LATE.—Tall-growing, vigorous, rather small leaves. Bids fair to be the latest of all our varieties. Firm, high flavor.

EREBUS.—Fine quality, not very fruitful—dark red, oval shape. Feeble.

SUCKER STATE.—Firm, good, vigorous and productive. On other grounds we learn it is not worth a cent.

COWING'S SEEDLING.—Poor in quality. Quite productive—vigorous.

LONG JOHN.—Promises to be highly prolific.

QUEEN OF THE WEST.—Vigorous, quite prolific—medium in size and quality.

WINDSOR CHIEF (Champion).—Large size this season—prolific, vigorous—sour when red, but of high quality when fully ripe, when it is of a dark color.

GLENDALE.—More productive than last year. The vines are strong and healthy. This is a late berry, firm, light red, and of fair quality.

RURALISMS

I WAS at Manchester on Thursday the 9th, in the midst of the rain and Mr. Battey's seedling strawberry. I had a wet time and a good one. There was a large party of strawberry growers present, Mr. Roe coming from Newburgh, N. Y., Mr. Parry from Cinnaminson, N. J., Mr. Hale, from Hartford, Conn., Mr. Lovett and others from places nearer by, and each one seemed to be glad he came. Mr. Battey's seedling is a remarkable strawberry in some respects. His farm is composed chiefly of sea sand with a small admixture of vegetable matter; and right on this sand the seedling strawberry was growing, a stranger to cultivation for a year at least, I should judge; yet there was an abundance of large, handsome scarlet berries, of a broadly conical form, red-fleshed, firm and juicy and of a decidedly rich and spicy flavor. In form the berry resembles the old Hovey's Seedling. As some evidence of how it was liked, the whole party remained in the field eating for a long time in the drizzle, until, finally, they were fairly driven out by the increasing rain, but only to go to the house for a strawberry lunch. A meeting was organized, the merits of the berry discussed, a list of points made out, and these altered and amended till all could agree to them. At last we all trudged to the cars through a pouring rain, each man carrying a large (inner) basket of strawberries with him. I couldn't carry all mine that way, so I put about a quart in my valise, and after tumbling about in that for a couple of days, they were in good condition on Saturday night, and pronounced to be excellent by a small party of ladies who ate them. That, certainly, speaks well for the market qualities of the fruit. I am much of the opinion that this seedling will become a popular favorite in time. If it produces such fine results in nearly pure sand, what may it not do when removed to a more generous soil?

THERE is a very prevalent opinion that the foreign grape (Vitis vinifera) is too tender to be grown in the open air. I have for many years known that this is not so. To convince some of my friends, I left out-of-doors last Winter four pot grown vines, one year old, with canes from five to seven feet long. They were left without any protection, even to the pots. The pots, of course, were badly damaged; but the extreme ends of these vines I left at the RURAL office this Spring, and the editor can say how much they were killed. [They were not injured, EDS.] The vines were the Black Hamburgh and the Muscat of Alexandria. I will state that I took some pains to grow these canes, and to have them well ripened to the end. I have done the same thing before. The thermometer reached 19° below zero.

It may interest the readers of the RURAL if I state, in this connection, some facts within my personal knowledge. When I was a boy Water Street, near the Battery, contained the residences of some of the best families in New York, and among others the Timpsons and the Van Antwerps, names still well known. In the yard of Mr. Rowland H. Timpson, who married into the Van Antwerp family, was a vine of the Muscat of Alexandria, which for upwards of forty years produced fine crops of fruit, which I can well remember eating more than once. The only trouble was occasional mildew, which was very much lessened by the protected position of the vine. It was finally destroyed by the first large Pearl Street fire. Mr. Camille Marié, a highly respected New York merchant still living, and a thorough amateur horticulturist, for many years grew the Black Hamburgh in the open air at Inwood. It was hardy enough, but in a year or two mildewed badly, and in consequence yielded little or no fruit. Some of the vines were still growing in a half wild state at my last visit. The Croton Point vineyards are among the oldest and best known in the country. Mr. William Underhill, who originally started them and always owned the larger part of them (though his brother, the doctor, got the credit for it), told me that he began with the foreign vine, but had to abandon it, not for want of hardiness, but because of mildew. The Rev. William P. Page, to whom we are chiefly indebted for the Farmers' and the School District Libraries, also started a vineyard of foreign vines on Long Island soon after the Croton Point enterprise. He told me he was finally compelled to give it up because the vines mildewed so badly. The experiment cost him upwards of twenty thousand dollars. Mr. Roswell L. Colt, of Paterson, N. J. (now deceased) many years ago grew the foreign vine in the open air on a smaller scale. Being a man of great wealth, he spared no pains in giving protection, fighting mildew, etc., and succeeded for years in raising Black Hamburgh grapes, that on one occasion at least competed successfully with those grown under glass. I know it because I was one of the judges, and also saw the vines in the open air. Archie Henderson, one of the best gardeners we ever had among us, used to winter his young foreign vines in the open air. In several places in and around New York there are foreign vines in the open air in favorable situations, which produce fair crops of fruit; some of these vines are quite old. It is not necessary, however, to multiply cases. The fact seems to be that foreign vines, in regard to hardiness, are very much like our native vines, some being hardy and others not. Notwithstanding, the conclusion must be accepted, that, with some exceptions, such as California and portions of our Southern States, the foreign vine is not adapted to open-air culture with us. The changes and vicissitudes of our climate are too great. Mildew attacks the leaf, then the fruit, and next the wood, when the disease becomes constitutional, and that is the end. HORTICOLA.

MICHIGAN STATE HORTICULTURAL SOCIETY.

Summer Meeting.

[Rural Special Report.]

THE Summer meeting of this Society was an occasion of more than usual interest, from the fact that it occurred at Benton Harbor, at the month of the St. Joseph River, and opposite the village of St. Joseph. It was here that the climatic advantages of the easterly shore of Lake Michigan first attracted the attention of fruit growers; and here, under the stimulating demands of the Chicago market, occurred the rapid and wonderful development of commercial fruit culture that, a few years since, attracted public attention so strongly to what has come to be known as the "Lake Michigan Fruit Belt."

After a welcome and response at the first session, on Tuesday evening, the subject of Birds vs. Fruit was freely discussed, developing the usual difference of opinion as to the actual preponderance of benefit or injury.

Answers to the question, whether or not frozen apples can be saved or utilized, were to the effect, that it would be far better and safer not to allow them to be frozen, though care in thawing may perhaps save them.

Experience was called for respecting the best method of destroying the Rose Chaffer, which has within the past few years developed here a tendency to attack and injure fruits before maturity. The suggestion to apply Paris-green or London-purple to the foliage and young fruit by means of water and a force pump, was met by the statement that such applications had failed to produce the desired effect. The only effective measure proposed, was the slow and laborious one of hand-picking.

"Of what varieties and in what proportions does the strawberry crop of this region consist," was then discussed. In response, it was stated that fully nineteen-twentieths of the crop of this region are Wilson's Albany; although a few Jucundas and Captain Jacks are said to be grown about South Haven. The question, "How to prevent mice from girdling trees," received, from several persons, the responses, "keep the ground clean"—"wrap with tarred paper," and "throw up a mound of earth about their trunks." Heavy rain on Wednesday morning diminished the attendance.

The subject of tree planting along highways was ably discussed by H. G. Reynold's and Judge Ramsdell of Grand Traverse County, followed by a paper, read by the secretary, from S. B Peck, of Muskegon. The most profitable varieties of fruits for the markets of Chicago, were considered from the dealer's stand-point, by Mr. Mason and Mr. Colby, both of that city, showing that the Wilson is, and as far as they may be concerned, is to be the "Summum bonum." By far the most earnest discussion, during the meeting arose on the subject of determining the capacity of fruit packages. An attempt to induce the last Winter's Legislature to enact a law, requiring all packages to be marked with their real capacity, had developed a wide divergence of opinion on the subject.

After the question had been thoroughly discussed, the following resolutions were offered and passed:

Resolved, First, that the using of the various sizes of fruit packages is detrimental to both shipper and consumer.

Second, that this society recommend a few standard sizes to be used, with their actual capacity marked on the outside.

Third, that we recommend the full-size quart box and the 12, 15 and 20 pound basket.

Fourth that we recommend the full-size three-bushel flour barrel for all commodities usually bought or sold in barrels.

Fifth, that we invite the co-operation of all fruit and vegetable growers and dealers in all the States to make our system universal.

Sixth, that we recommend that this system be adopted by the Legislatures of the various States, and that the small snide baskets be done away with.

A committee was appointed to lay the matter before the public through the press, and thus bring about a reform.

A discussion upon the subject of "yellows" resulted in the conclusion that the prompt and complete destruction of diseased trees is, with the present knowledge of the subject, the most effectual mode of arresting or restraining the progress of the disease. The meeting adjourned on the evening of Thursday, (9th), and is regarded as a very interesting and profitable one. T. T. LYON.

Fruits on the Hudson River.

WE have had an abundance of rain this season and the fruits promise a large crop, except apples, which are almost a failure. We are, however, afflicted with rose beetles, which are very destructive to grapes and peaches, eating the young fruit. A young orchard, bearing now for the first time, is almost completely ruined by them. The only remedy, to my knowledge, is hand-picking, which is very tedious where they are so numerous. Strawberries began ripening quite early, though the Spring was late. I picked the first ripe Capt. Jack on May 30th, and Primo on June 20th, and these were both grown on a steep hillside facing southeast. Grapes are looking fine; all varieties have set a full crop and are now most of them setting their berries. Some young Jefferson vines are setting many bunches of larger size than I have ever seen before. Pears are a large crop and unusually fine.

Fishkill, N. Y. J. G. BURROW.

Field Crops.

THE CULTURE OF CORN.

J. B. LAWES, LL. D., F. R. S.

* The eighth annual report of the New Jersey State Board of Agriculture contains a paper by Mr. Henry Stewart upon a subject which has occupied my attention for a great number of years, and which is now coming to the front as a great question of economy in commercial agriculture. It may be described briefly as "Freight versus Artificial Fertility."

Mr. Stewart says:—"It has been the fashion to believe, or at least to say, that the farms in the eastern parts of the country are exhausted; that agriculture here is in danger of ruinous competition from the newer lands of the West, and that it is cheaper to buy Western corn than to grow it in the East." And he goes on to "show the fallacy of such an idea as this" by the following figures:—

Freight on a bushel of corn from Chicago to New York..... 30 cents
Cost of fertilizer to produce a bushel of corn.. 09 cents.

The question here raised is not only one of importance with reference to the East and West of the United States, but also as regards the United States and Great Britain; for though it is true that we do not grow corn, it is also true that our wheat is gradually being displaced by the cheaper-grown wheat of the States.

Mr. Stewart goes on to say, "Recent investigation and past experience have shown that while wheat requires from one-half to full quantity of all the nitrogen to be supplied in a fertilizer, depending upon condition of the soil, corn, on the contrary, requires, even on comparatively poor soils, only about one-fourth the nitrogen to be supplied as compared to what the crop contains."

It would be very joyful news to our farmers in Great Britain if I could assure them that wheat requires only "from one-half to full quantity of all the nitrogen" contained in the crop to be applied in manure; or, in other words, that by the application, at the most, of one pound of nitrogen in manure, a pound could be recovered in the produce. So far, however, from my being able to accept this statement, I feel no hesitation in saying that whatever may be the nature of the recent "experiments and past experience" to which Mr. Stewart refers, if they assert, as a general agricultural fact, that the application of half a pound to a pound of nitrogen in manure will produce one pound of nitrogen in a crop of wheat, or that a quarter of a pound of nitrogen in manure will produce one pound of it in corn, they are based upon error. The only manner in which such a result might possibly be arrived at would be by the continuous growth of wheat or corn by means (1) of a mineral manure alone, and (2) by the same manure combined with salts of ammonia, if this were done with very great care, and for a sufficiently long period; although I should even then expect more than a pound of nitrogen would be required to produce one pound of that substance in increased growth, and that more nitrogen would be recovered by the corn than by the wheat.

Mr. Stewart says, further, that Charles V. Mapes is opposed to my idea that corn should be placed in the list of grain crops which require to be supplied with a surplus of nitrogen, but has insisted that it should be classed with clover and the leguminous crops which yield larger quantities of nitrogen in their product, but require a very inconsiderable supply.

The statement that corn yields large quantities of nitrogen, like the leguminous crops, is somewhat inconsistent with the table given by Mr. Stewart on the previous page (46) of the report, which shows that corn contains not only less nitrogen than the leguminous crops, but even less nitrogen than wheat. My object, however, is, not to find fault with Mr. Stewart's statements, but to endeavor to correct what I consider to be erroneous in them.

First, then, with regard to corn: That it is a gramlnaceous plant and possesses all the properties of that order, I have not a shadow of doubt; all the plants containing large quantities of silica in the ash possess properties in common, one of which is that, when liberally supplied with nitrogen, they are capable of outgrowing and overpowering all other species of plants. It is quite true that corn is less dependent upon an artificial supply of nitrogen than wheat, oats or barley, and the reason for this fact I have frequently pointed out, viz., that after the other crops are ripe, corn continues its growth during the exact period when the liberation of nitric acid in the soil is most active, and it is this circumstance that enables the United States farmer to sell corn so much cheaper than wheat.

At Rothamsted we have abundant evidence to show how large is the quantity of nitric acid liberated during the Summer months. For example, the water collected from the drains of our experimental wheat-field in July contained no nitric acid, while the soil of the adjoining field, where no crop was grown, contained in September as much nitric acid as would have supplied the nitrogen contained in 50 bushels of corn.

The United States farmers are now embarking largely in the use of artificial manures, and therefore possibly may be glad to hear the views of one who has been studying their properties for more than 40 years.

First, they will find a very great difference between the amount of ingredients which is supplied in a manure and that obtained in the produce; then two of the ingredients generally supplied in manure, viz., phosphoric acid and potash, enter into very fixed compounds with the soil, and are only recovered over long periods of time. In confirmation of this fact I may say that at Rothamsted we are at the present moment taking up in our wheat crop phosphoric acid and potash which were applied 30 years ago; some considerable addition, therefore, in the shape of interest, must be charged on the cost price of these substances by the farmer who employs them as a manure. With regard to nitrogen the case is different. It appears probable that nitrogen, applied either as ammonia or nitric acid, does not permanently enter into any fixed combination in the soil, unless it has become a part of living vegetation; and it may be considered an established fact that wherever nitrogen is used as a manure there will be a considerable loss of the amount applied, although the amount of such loss will vary with the seasons and other causes at present unknown.

In consequence of the severe competition to which the British farmer is now exposed, the question of artificial fertility has been recently occupying my attention, and I have come to the conclusion that, as artificial manures can be purchased quite as cheaply in this country as in the States, the crops grown by their aid cannot be produced more cheaply in one country than in the other. What we are suffering from in Great Britain is the competition of crops grown by means of natural fertility, which is cheaper than the fertility that can be supplied in any other form.

The views of Mr. George Ville with regard to the sources of nitrogen, and the properties possessed by the various crops for gathering it from the atmosphere, appear to have found much favor in some parts of the United States. We have not thought it necessary to bring forward any formal evidence to disprove these views; but I may say that, as expressed by Mr. Ville, they are entirely opposed to the facts that have been established by the result of the experiments at Rothamsted.

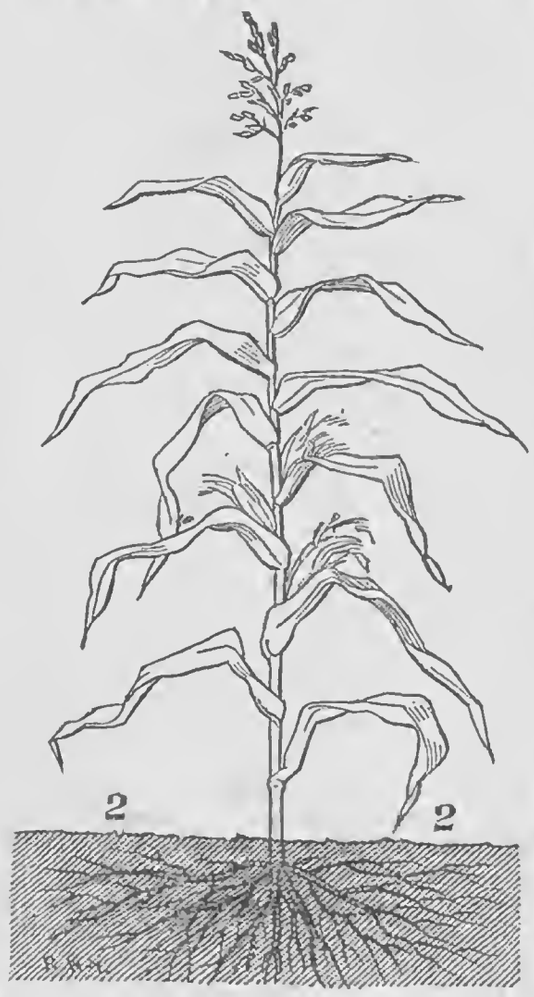
* We are much indebted to Mr. P. T. Quinn, Secretary of the New Jersey State Board of Agriculture, for the above article, which has not until now been published.

NOTES FROM THE RURAL FARM.

What is the advantage of hilling up corn? We should much like to know. Until two years ago we, in common with the farmers about us, planted our corn in checks and

HILLING SYSTEM.—FIG. 317.

hilled up. Two years of experience with level cultivation have well-nigh convinced us that drilling in the seed in rows and level cultivation are to be preferred for the generality of seasons, for light lands at least. There is a belief among farmers that hilling up helps to support the corn plant and consequently prevents lodging by high winds. Our experience does not confirm this belief. The Chester Co. Mammoth and Blount's Corn are both tall-growing kinds—taller than any of the varieties which were last year cultivated by our neighbors. And yet, though we had high winds while the corn was in bloom, and again when the grain was glazing, our corn stood fully as well as theirs. *Does* hilling up give support to the stalk. Before answering this question, one should consider what part the lateral roots take in supporting the plant, as it is from about these that the soil is taken to heap about the stem. If these lateral roots are severed by plowing, hilling up may be advantageous—but when shallower cultivation alone is followed the stalks receive all of the support which a full, natural root system can give; and hence it is, we believe, that our plants ten feet high stood as well as our neighbors' which were not so tall by a foot or so.



FLAT CULTURE.—FIG. 318.

Great crops of Indian corn have been produced by plow cultivation and hilling up. But possibly, had the cultivation been shallow and level, those crops would have been greater. It may be admitted that land is sometimes so rich that root-pruning (plowing) serves to repress stalk and leaf growth and to favor the formation and development of grain. We do not know, never having had a field so rich. But if it were otherwise we should, with our present experience, still pursue the drill-row system and the flat cultivation, though careful to plant our seeds and to mark our drills further apart. We have full faith that the sun and air and thorough shallow culture would effect all that any interference with the roots would effect.

In drill-row cultivation, of course, neither the cultivator nor plow can be run but one way. The narrow belt on which the plants grow *must* be hoed or the weeds suffered to grow. But it may be considered that if the rows are straight the cultivator may be run so near to the plants that very little hoeing is really necessary. This narrow belt which demands hand labor is the only objection to drill-rows that we have yet discovered. It is plain on the other hand that corn plants one foot apart in the drill will thrive better than when three or four plants are crowded together as in the check system. Very likely on hillsides level cultivation would prove impracticable, and as our experience has been only in the cultivation of ground level or nearly so, it is of this alone we speak. Our illustrations are intended as a help towards placing before the thoughtful reader more forcibly the question as to the advantages or disadvantages of hilling up or level cultivation; plowing or cultivating near the surface only—leaving the entire root system of the plant as nature intended it to grow. At 1–1, Fig. 317 the roots, though in an exaggerated way, are shown to be severed by the plow and more exposed to the action of the sun's rays. It would seem, therefore, that the plant as shown at 2—2 in Fig. 318 should have a greater power to resist drought, since it has a more widely extended root system which is more evenly watered by rain.

CUTTING AND CURING CLOVER.

It is generally understood among farmers that clover should be cut a short time before full blossom in order to preserve its juiciness and flavor. Though there may be an increase thereafter in weight and bulk, the addition is not in nutritive elements but in woody fiber which for feeding purposes is of no great value. Early cutting also gives the second growth, or aftermath, a better chance, so that if desirable, it may be mown again. In curing clover, I believe the proper course to be to put it up in cocks on the afternoon of the day on which it is cut, if the weather permits, and not to haul it to the barn at once. Clover put up in good shape in this way will cure during the time it is in the cock nearly as much as it would if exposed to the sun, so that on opening in the morning the sun will soon dry out the "sweat," and the clover after a light shaking, will be fit for the mow. It is better when cured in this way for the reason that it is brighter in appearance and the clover leaves are left intact. This, experience has shown, is not the case when the clover is cured altogether in the hot sun, or when it is left standing until out of blossom, and until the stalk is void of juice. An incidental advantage accruing from putting up hay, especially clover, in this way, is, that, in case of a rain during the night, it is in good shape to withstand it, and is much better out-of-doors than in the mow half-cured, to mold and heat.

J. W. D.

NAME OF CORN.

In the Rural of June 4, Professor Blount says: "For the benefit of Waldo Brown and others who think they have discovered a great secret," etc. I think the Professor refers to a statement that I found the Peabody Corn and Blount's Prolific to be identical. I would not on any account do the Professor injustice, and write now asking that I may be set right, if wrong. The first I ever saw of this corn was in Wayne Co., Ohio, in September 1879, and I was at once much interested in it. A stalk having seven perfect ears on it, was exhibited at a local fair, and I also saw a half acre of it growing. I bought five bushels of the seed, and sent out 1000 small packages free, under the name of Peabody Corn, which was what the man called it who furnished me the seed. In the Spring of 1880, a subscriber to the Rural sent me a few ounces of the Blount's Prolific Corn, which he had grown from seed sent out by you, and I planted it at one end of my acre of Peabody Corn. I could see no difference in the two, whatever, and so naturally concluded they were identical. I believe that to Professor Blount belongs the honor of having originated this corn, and had I known what I now do, I should have advertised it in his name, and given him all due credit, for I believe that we owe a debt of gratitude to the men who by careful experiment are improving our grains and vegetables. I hope the Professor will accept this apology.

Waldo F. Brown.

Farm Topics.

THE WEIGHT OF COW DUNG.

Mr. Bliss in his remarks made week before last, on page 402, replies to our statement in regard to the weight of cow dung, but he by no means disproves it. Instead of explaining his view of this rather insignificant question, he insinuates that our reply to his objections was quibbling. We gave some facts which may be repeated in a succinct manner as follows, to show that the weight of authority is against Mr. Bliss's position and supports our first statement as regards the weight of cow manure, and to utterly disprove Mr. B's charge of quibbling.

1. There is nothing that enters into the composition of cow dung that has a higher specific gravity than water.

2. An analysis of cow dung given in a work on calico printing shows that the specific gravity of the component parts of the dung is actually somewhat less than that of water.

3. Geo. E. Waring, a thoroughly competent authority, gives the weight of cow manure to be 7,080 pounds to the cord; or 920 pounds less than an equal bulk of water.

4. We gave, on the authority of Joseph Harris, taken from his "Talks on Manures," the weight of well trodden horse manure at 4,800 to 5,000 pounds to the cord.

5. We stated that on a trial with freshly dropped cow manure we found it to float, and not to sink, as Mr. Bliss very confidently stated it would *always* do.

Now in addition to all this, the writer has had weighed a load of 64 cubic feet of solid cow manure free from litter, which has been lying in the bottom of a barn cellar for six months, and is very solid, and which was thoroughly well trampled in the wagon box, and the weight is 3,428 pounds, making the cord to weigh 6,856 pounds. There might have been some little water added to this manure, but not much, to completely saturate it, as all the liquid from the cows pours from the gutter and the trap-doors above on to the manure in the cellar.

It is rather annoying to be compelled to go to all this trouble to discuss such an unimportant question as this and to gather all these facts to support our first statement in reply to an inquiring friend, for no other purpose than to show that Mr. Bliss's objection to our statement is not based on any other authority than his own

observation (which we do not for a moment doubt), but which is unsupported by any other but Dr. Dana's which is clearly wrong, and then to be met with a charge of quibbling! All the quibbling, in point of fact, is on Mr. Bliss's side. We think this remark is justified by the fact that on page 336 he says "*Cow dung always sinks in water like a stone;*" and on page 420 he says "I never undertook to say that cow dung might not be found that would float for a time; or to disprove that iron under certain circumstances will swim." For this is the veriest quibbling, if "always sinks in the water like a stone," has any meaning. We have nothing more to say on this subject than has been said, which we think is sufficient to satisfy any reasonable man.

The Herdsman.

IMPROVING STOCK.

JONATHAN TALCOTT.

AMONG cattle breeders, and especially among the breeders of the different pure breeds, I have lately noticed a growing disposition to find fault with or depreciate all or most other breeds in comparison with what they are engaged in breeding. This disposition is usually most plainly shown with regard to other breeds that come more or less closely into competition with their own. To me this seems a short-sighted policy; for the general public, seeing this general depreciation of other breeds, coupled with high encominms on the special breeds in which the writers may happen to be interested, is apt either to conceive a general distrust of the praise as well as of the blame so lavishly meted out, or else falsely to imagine that the alleged merits of the different breeds are a matter of puffery rather than of reality, and that the despised "natives" if they got as much care and obtained advocates as earnest, might gain as high a place in public opinion as any of the pure breeds. Surely all this defamation of competing breeds is as unwise as it is generally untrue. There is plenty of room for every breeder to select some particular breed and then to try to improve it by careful selection of breeding animals, and judicious feeding in order to obtain the special object desired, whether it be beef or milk for sale, or butter or cheese.

It is a fact well known to all breeders who have studied the subject, that to be successful a standard must be set up much higher than the ordinary level, and then measures must be taken to reach that standard, otherwise no permanent good can be accomplished in breeding. It is also well known that the suitability of the different breeds to various localities depends mainly upon the care and feed given them there—the Short-horn and Hereford that make such fine carcasses of beef in some places where they are properly fed, would starve to death in other situations where the West Highlander or some other hardy race of mountain cattle would grow and thrive; so, too, would the thoroughbred horse or even the trotter be worthless where the Shetland pony or the Texan mustang would luxuriate. Like many others in times past, many breeders do not breed for the pleasure of the knowledge thus obtainable or with any desire to become eminent in the art of breeding, but merely either as a present pastime, or to make money by adopting some breed which they think is the best adapted for that purpose. All such breeders of live stock will not be as useful to the country as those who engage in breeding with the view of learning the art, or science, of breeding and to improve the breed in some particular, whether it be for milk or beef. Those who engage in breeding for the latter object will not be likely to change with every passing occurrence, but will hold steadily onward in their views and methods, to best accomplish the desired result. That there are on our farms too many poor animals that are, in fact, comparatively worthless, is a fact known to most farmers, but to most farmers the breeding of better ones is considered a slow and toilsome process which they can never spare time enough to accomplish. If all such would, each in his own sphere, select some breed and endeavor by breeding and feeding so to improve it as to make the majority of the animals valuable to their owners, what an immense amount of good might thus be accomplished, and what a fund of knowledge would thus be obtained, that would be of great benefit not only to those persons who should adopt such a course, but to others who would occupy the places of lookers-on, who might be induced by their neighbors' successes to go and improve their own flocks and herds in like manner. How much better for a community where a few such men are engaged in improving their farm stock than where no such persons are thus engaged and no progress marks the passing years.

A Sterile Bull.

IN further answer to A. S. C., Anamosa, Ia., in the Querist Department of the RURAL for June 4, I would inform him that feeding any animal, male or female, highly for the purpose of making a fine show, is very injurious. This not only renders them liable to barrenness, but weakens their constitution and otherwise injures them. For an animal to breed well, it should be kept only in good moderate condition from birth up. Males, however, when they have considerable covering to do should have a moderate increase of oats. To this some add three to six eggs daily and as many quarts of milk. A yard at least 20 feet square should be given for exercise, but a grass plot or a whole acre would be still better. In the absence of these a bull ought to be walked out one-fourth to one-half a mile or more and back mornings and evenings. A stallion requires twice or thrice as much exercise. In some a single leap is not sufficient. I have found it occasionally necessary to have this twice or even thrice repeated. "B."

NOTES BY A STOCKMAN.

EARLY LAMBS may be very profitable where they are raised for a city market, to be sold when three months old; and the owner may find a consolation for the labor and worry of staying up nights and coddling the ewes and fussing with stupid lambs to get them to suck and to put them on their feet, in the very fair price he may receive for them. Twenty-five cents a pound for a 40-pound lamb may cover up a multitude of worries; but the sheep-owner who produces only wool and mutton had better avoid this business of having the lambs dropped early. There is less loss of lambs, less bother with the ewes; the lambs grow faster and are heavier, and one has more contentment and comfort every way when lambs are dropped on the grass after the weather has become warm. May lambs will make better sheep than February or March lambs, and will give much less trouble in the rearing.

THE past season has been very unfortunate for the owners of flocks in the West. The cold weather and the late season have caused a loss of a third of the lambs, and the remaining two-thirds have been saved only at the expense of a great deal of care and trouble. A Western friend writes me that out of 2,500 ewes he has but 600 lambs. The same result has happened with small flocks, and every experienced owner has suffered unusual losses. In Ohio the loss in the flocks of the best shepherds is said to be more than 15 per cent. Illinois shepherds have suffered to the extent of 30 per cent. Some habitually careless owners have not reared a single lamb out of flocks of 30 to 50 head.

IT is a question if the cold Spring is altogether at fault, and if it is not, rather, the extremely severe Winter, that has produced the weakness of both ewes and lambs. And, further, I would hazard the suggestion if there has not been some neglect even in the best-managed flocks. Unusual circumstances require unusual provisions. What provisions have been made to avoid the evil effects of the long, severe Winter? How many sheep have gone without water and have been compelled to lick snow to quench their thirst? This is very injurious to ewes in lamb; it chills the fœtus and weakens the ewe, and is productive of the most serious losses which happen in the exposed mountain pastures of the Scotch shepherds, as well as on our own Western plains. The mischief is done before the warm weather of Spring arrives, and genial days and grass are unable to save the lambs, which are either dropped dead or with too little strength to get up. The ewes, being weak and helpless, are not in a condition to give much attention to their lambs, and many of them have not milk, however motherly they may be inclined.

THE feeding of turnips that have been exposed in the Winter, although they may not have been actually frozen, has frequently caused abortion in ewes from the chilling effect on the lamb *in utero*. The drinking of ice-cold water, or of melted snow, or the eating of snow, at a temperature of zero, perhaps, cannot fail to be disastrous. And there is little doubt that the large loss of lambs is due to some cause of this nature operating through the Winter, and not to the coldness of the Spring alone.

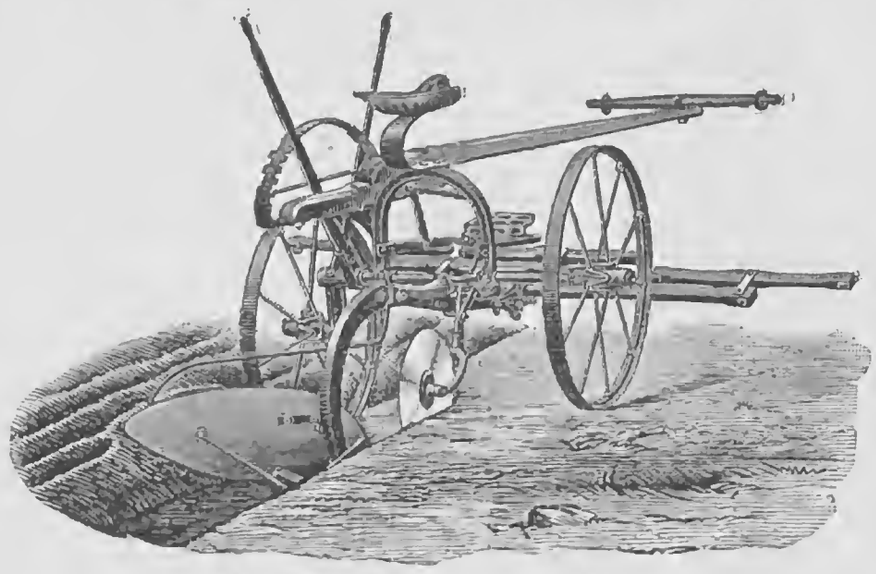
WHAT does it profit a man if he saves a few dollars in the lodging and provision of his flock and loses his crop of lambs? It has come to be a question of dollars and cents, and not of humanity or the avoidance of long-continued cruelty to animals. "Man's inhumanity makes countless thousands mourn" applies with great strictness to the poor brutes which he uses as instruments for making money, and if a few cents per head can be saved in the caring for them, they are mercilessly exposed to the intolerable rigors of the hardest Winter. And the owners complain, with great bitterness, that one-third of the lambs have been lost, and consider it a great hardship, as if they themselves were not to blame for it all.

NOT many years ago it was the fashion to have prayers and fastings and set days for imploring deliverance from epidemics, such as cholera, yellow fever, etc. Men did not then realize that their own nastiness caused these inflictions and that a "mysterious Providence" was not the author of the misery and death which slew thousands in a day, at times. And yet we do not even now realize that all the diseases, "unknown" and known, which destroy millions of live stock every year, are caused wholly by the fault of the owners. It may be ignorance, as it was years ago in regard to human epidemics, but there is no excuse for ignorance now-a-days. *Ignorantia legis neminem excusat* (Ignorance of the law excuses no one) is a well-known legal maxim. No man is let off because he does not know the law. He learns by sad experience and is apt to remember the next time. But owners of stock won't learn; year after year they suffer (or rather their poor animals suffer) and they grumble; but still they don't mend their ways. And all because they think it is cheaper to let their stock die than to take proper care of it.

IT may be so with some. But there is a great outcry made by some persons that the law should be evoked; that some one in authority, the Commissioner of Agriculture, or some other hapless official, should put his shoulder to their wheel, while they stand around and make a fuss. This is a great mistake. Let every man take care of his own cattle and if he will not, let him be made amenable to the law relating to cruelty to animals.

THERE is law enough for this case, if only it could be put in force.

MONEY is made in stock keeping by exercising the greatest skill and good management. Here is an example. It relates to poultry which, considering that it is live stock and of great importance to our interests, may perhaps be made the subject of note here. A Maryland farmer recently sent 145 capons to market, the total weight of which was 1,625 pounds, average over 11 pounds; the heaviest pair weighed 20½ pounds and the sum realized by the sale was $520. This certainly puts the cap on the business of stock raising. What other kind of flesh would sell for $520 for the weight of a moderate steer?—barring Alphea Jerseys, of course. But these capons actually brought for their value as meat as much as is given for a Jersey cow with her valuable pedigree included, and her black switch and escutcheon to boot.



THE CHAMPION SULKY PLOW.—FIG. 319.

Why should poultry alone of all our live stock be so rarely improved by emasculation? These capons, as "roosters," would have brought in the market perhaps five or six cents a pound, or less than a hundred dollars. The difference in value goes to pay this Marylander for his enterprise. That is the sum of it.

THE RURAL NEW-YORKER recently mentioned with admiration the Illinois dairyman who kept but one cow and yet sold over 40 pounds of butter weekly. This record surpasses that of the wonderful Jersey cows, but this more wonderful cow has not yet been introduced into high cow society. But the story is well matched by that of a Kentucky ewe which has produced at a single birth 79 (seventy nine) lambs; all of which lived but a short time. There was not life enough to go around so many. This is told seriously by a local Kentucky paper and is vouched for by "several reliable citizens." Somebody must be passing around some Jersey breeder's hat.

Arboricultural.

A RUSSIAN MULBERRY FOR THE WESTERN PLAINS.

ON the bare Western plains—so different from the forest-burdened East—an interest is felt in every tree and sort of tree that can be made to live and grow. Even of the contemned poplar and willow sorts that are a little more enduring or available than the genus in general, have been hailed with hopeful delight as giving promise of the needed shelter and material so badly wanted. Mr. G. F. Clark, of Beatrice, Nebraska, sends an interesting account of the promise of serviceableness afforded by a sort of mulberry brought by the Mennonite immigrants from similar arid plains in Russia—the steppes of the Volga, in latitude about 49 deg. There this mulberry is the best source of wood for farm supply, and so valuable and indispensable that the new settlers brought along seeds which grow well and, like other sorts of mulberry, very rapidly when young. The full hight of the species is claimed to be about 40 feet. As in other mulberries, too, the leaves of the seedlings vary in being more or less lobed: some of these are cut as much as those of any oak, and these varieties are propagated as trees for ornament as well as use. They will, no doubt, make pretty lawn trees, for the foliage and figure of all sorts of mulberry trees in unbroken health are pleasing. The fruit is said to be edible and good, but the pale mulberries are generally inferior both in size and flavor to choice specimens of the dark sorts.

Mr. Clark thinks this Russian mulberry is not of the alba species. Loudon describes a mulberry native on the steppes as Morus Tartarica, but thinks it only a geographical variety of alba, having variously scalloped leaves and reddish fruit of no very good flavor.

Mulberry wood is very durable, although apparently open-grained and soft. Botanically it is cousin to the Maclura, or Osage Orange, also a very durable wood, and also having fleshy, yellow roots, soft but tough. Undecayed mulberry wood was found by Mr. Layard in the ruins of Nineveh, and mummy cases of the same wood are seen in the museums, still sound and fresh to the very chips. This durability renders the trees, even though small, very useful to farmers for stakes and posts, and the rising interest in silk-worm feeding gives additional interest to them, especially to varieties of M. alba, the leaves of which are thinner and finer than those of other species, while the trees can generally be grown—like select sorts of these Russian varieties—quite easily from cuttings, set out in Spring like cuttings of currant or willow.

THE REASON WHY.—The RURAL, in its admirable Shrub and Tree Special, says: "We are at a loss to know why the Laurel-leafed Willow is not selected as a stock for the Kilmarnock" The reason is the same as is given by Mr. Parsons on p. 107, in regard to maples. The Kilmarnock belongs to the class of willows with lobed leaves, called Goat Willows (*S. caprea*), and as it is a reluctant sort about growing even by cuttings (although a willow), it is found necessary to accommodate it with a stock of its own kin. W. G. WARING, SR.

Industrial Implements.

THE CHAMPION SULKY PLOW.

THIS plow is made by Messrs. J. Lane Reed & Co., Dayton, Ohio, and has gained an excellent reputation wherever it has been used. Wrought and malleable iron has been used almost entirely in its construction, and it is free from all complications of braces, springs and triggers, which are apt to get out of order frequently and to need replacement. The wheels are of iron, with wrought-iron spokes well staggered and wrough-iron tires. The hub-boxing consists simply of an iron sleeve fitting tightly inside the hub and revolving with the wheel. When worn, the boxing can be readily renewed at a trifling cost. The spindles are of wrought iron and are protected from wear by sand caps, and whenever they become worn they, too, can be easily and cheaply replaced. There are two levers both on the same side. That nearer the operator

gauges the depth, and throws the plow in or out of the ground: that further off adjusts the furrow wheel and "wings" the share. The plow is constantly under control of the plowman, runs level at any depth, and being locked in the ground cannot be thrown out. The weight of it and of the earth upon it is carried by the wheels, and it can be used in all conditions of the soil and on ground foul with weeds and trash. The plow is very easily handled and of unusually light draft, and is warranted to be constructed of good material and in a thoroughly workmanlike manner. We have had excellent reports of it from several who used it last year, and all speak of it in praiseworthy terms.

Miscellaneous.

What Others Say

ICE FOR SUMMER.—Mr. Henry Stewart reminds the readers of the New York Times that if they would have ice next Summer, they must prepare for it now or in the Fall. Where a farmer has a stream bordered by a muck swamp, he is well provided. He may dig out the muck during the leisure days of Summer and Fall and make a pond which will supply the ice. A large pond is not required. A cubic foot of ice weighs 55 pounds; 50 cubic feet in round numbers make a ton. If six inches thick, a ton of ice may be taken from a surface of eight by 10 feet, or 80 square feet. A pond 80 feet wide and 100 feet long would furnish 100 tons, which would supply eight persons with 200 pounds a day each for four months. This would be sufficient for the use of eight dairies of 100 cows each, or for the cooling of eight times 2,000 pounds of milk daily for the season of four months.

TO AVOID SUNSTROKE, says Dr. Mann, in excessively hot weather, exercise should be very moderate; the clothing should be thin and loose, and an abundance of cold water should be drank. Workmen should understand that as soon as they cease to perspire, while working or marching in the hot sun, they are in danger of sunstroke, and they should immediately drink water freely and copiously to afford matter for cutaneous transpiration, and also keep the skin and clothing wet with water. Impending sunstroke may often be warded off by these simple measures. Straw hats should be worn, ventilated at the top, and the crown of the hat filled with green leaves or wet sponge. It is better to wear thin flannel shirts, in order not to check perspiration.

R. N. HANDY says in Green's Fruit Grower, that an apple tree should under no circumstances be trimmed when frozen. Cut two limbs from the same tree, of equal size, one in February, when the tree is frozen, and the other the following June, and the one cut in June will heal more and better during the season than the one cut in February. The best time to trim apples is from June to August.

MR. GREEN hesitates before advising any man to borrow money, but if he must choose between borrowing to pay for the labor to do work when pressing, and leaving the work undone until the proper season has passed, he says borrow!—And so say we.

THE Vermont Watchman says:—"After fifteen years of patient labor in testing varieties of fruit suitable to the colder parts of New England, these tree peddlers come into our own immediate neighborhood and sell worthless varieties at a dollar a tree when we have to burn up hundreds, and some years thousands, of far better trees that we offer in vain at twenty-five cents apiece."

THE WEALTHY APPLE AS A KEEPER.—Dr. Hoskins of Vermont, says that on May 20th he ate the last specimen of the Wealthy from his cellar, and found it still juicy and of good flavor, though the skin was slightly shriveled. These apples were kept on a shelf near a window, which is by no means so good a way as to pack in barrels or boxes in a dark place. No Baldwin apples from Massachusetts within his knowledge had kept better the past Winter than the Wealthy. Probably the latter, if grown alongside of the Baldwin, would not prove so good a keeper; but grown in northern Vermont, even after so late and warm a Fall as the last, there is no difficulty in keeping the Wealthy until April. For use after that date he prefers Scott's Winter, which was still firm and fresh, and at its very best in flavor as a dessert apple. Magog Red Streak is intermediate in keeping between the two. These three are our best Winter apples, the trees of which are perfectly hardy in the coldest parts of Vermont.

FARROW MILKERS.—The Editor of the Rural Home, who has been visiting among the farmers near Rochester, N.Y., says that Messrs. Olmstead & Son, have one practice that would hardly be approved by all dairymen. They buy new-milch cows and continue to milk them right along, without calving, for three or four years, until they are palpably shrinking in milk, when they beef them and buy fresh ones. The Editor inquired whether they had kept accurate records of the annual product of butter of cows two, three, and four years from calving, as compared with those calving every year, and was answered that they had not. He thinks a cow might produce as much for two years, with one calf as with two, and possibly more, but he questions whether she would the third or fourth year. It is an important question for dairymen, and one warranting the most thorough investigation.

ERADICATING THISTLES WITHOUT LOSING A CROP.— Mr. J. S. Woodward in the N. Y. Tribune says that he has found the following way successful in entirely ridding three farms of thistles without losing the use of the land, but getting a crop every season: Have the land rich if possible, at least get it well seeded to clover, and by plastering get an early growth, so as to mow it for hay just as the thistles begin to show bloom. After mowing apply a little plaster so as to quickly start the clover, and when about one foot high, say from July 20 to August 5, carefully plow the land with some plow that will turn all the soil; roll down and harrow thoroughly so as to cover every thistle, leaf and branch; a few thistles will show themselves after this, but when they do begin to come up again, hoe thoroughly with a cultivator having broad sharp teeth that will cut off all the thistles under the ground; in two days go over, and with a sharp hand-hoe cut off any stray ones that may have escaped the cultivator; you will find them growing fewer and paler each time, but follow this up as often as they appear until freezing up, not letting a single thistle get a full leaf, and, you will never see a thistle again on that plat until it comes from the seed, and you will have a field in the very finest condition for any Spring crop.

PROF. BUDD, speaking of the Ostheim Cherry, in the Iowa Homestead, says he has had several letters from Europe, saying it had proven one of the hardiest and most profitable varieties grown on the steppes. Not knowing that it was to be found in this country, he had already ordered trees from the nursery of Dr. Regel at St. Petersburg, Russia, when he incidentally learned that E. Meyer, of St. Peter, Minnesota, had brought this variety with him from his home in north Germany, and had fruited it for a number of years in the most trying portion of Minnesota, where he had become discouraged in growing the apple. Prof. Budd received, this Spring, a few small trees of the Osthelm from Mr. Meyer, the blossom buds upon which were in perfect condition after enduring the past severe Winter in their northern position. The hardiness of the tree and of the fruit buds seem beyond question. The next point of consideration is the size and quality of the fruit. Charles Downing says: "Fruit large; roundish-oblate; skin red, dark at maturity; stalk long; flesh, liver-colored; tender, juicy, almost sweet sub-acid; very good. Season, middle of July."

A NEW CLEMATIS.—The London Agricultural Gazette says that Mr. Charles Noble, of Bagshot, a famous raiser of new clematises, had eclipsed all previous efforts in this direction, by lately exhibiting the largest and most perfect flower of its size that had yet been seen. It was an eight-petaled flower, nine inches in diameter, and mauve in color, shaded with lilac. It is a great beauty, and has been named in honor of Mr. Gladstone.

CHINESE PEA-CAKE, probably made from a species of Dolichos bean Soja hispida—which is cultivated in China and Japan, is shown by analysis to possess about the same nutritive value as decorticated cotton-cake. It is very rich in nitrogenous matters, says the Mark Lane Express, the percentage of nitrogen being 6 28; there are also nearly 30 per cent of carbohydrates, or heat-givers, and about 7 per cent. of ready-formed oil. This bean is being tested at the Rural Farm this season.

HAWKS AND OWLS prey upon rats, mice and other small animals, thereby keeping them in check: while the crow prefers grubs, cutworms and carrion to any other kind of food, and while they may occasionally rob a bird's nest or pull up a little corn, they do a thousand acts of kindness to the farmer for every one that is injurious. So says the Sun, and there is a good deal of truth in it.

WASH FOR OUTBUILDINGS.—Professor Kedzie, of the Agricultural College of Michigan, an expert chemist, recently said that a paint or wash made of skim-milk, thoroughly skimmed, and water brine will render wood nninflammabic, and he proved it by experiment. He said this paint, or whitewash, is durable, very cheap, impervious to water, of agreeable color, and, as it will prevent wood from taking fire, urged its use, particularly on roofs, outbuildings, barns, etc. This comes to us through the N. Y. Herald.

C. J. REYNOLDS remarked to the Elmira Club, as the Husbandman reports, that some time ago he saw in Ohio a new kind of milk vessel. Dairymen there use glazed earthen-ware instead of tin pans, and they say the change is an improvement. The dishes are made of fire-clay, burned hard and finished to a smooth surface, which is glazed, so there is no impurity in it to impart odor or taste to the milk. W. A. Ward said very likely glazed earthenware may be better than tin. One advantage readily seen is in the thicker substance, less susceptible to changes through atmospheric influences. Then the glazing may be cleaned more readily than tin with seams and joints. Mr. Reynolds bought some of the earthen pans for trial and they gave satisfaction. They are easily cleaned and easy to handle. Each holds about six quarts. Around the top there is a rim projecting about half an inch—a flange which serves to catch on the churn or any other vessel into which the milk is to be emptied. Altogether these pans have proved satisfactory so far as his observation extends, and he thinks they are worthy of further trial.

BARBED WIRE FENCE.—There is nothing more surprising, says B. F. J. in the Albany Cultivator, than the extent to which barbed wire is coming into use for fencing, unless it be the way in which the theoretical objections to it are overthrown by use and experience. The best form of barbed wire is now found to be two strands of No. 12 steel wire, galvanized and twisted, with barbs four or five inches apart, weighing from 16 to 17 ounces to the rod, and costing 10 cents per pound in large lots, 10½ cents for moderate quantities, and 11 cents for a few pounds. A complete fence is now considered to be one of five wires, divided to suit the builder, fastened to white cedar posts standing four feet ont of the ground and one rod apart, and can be made by the mile at less than 75 cents per rod.

THE Bee-Keepers' Magazine says: "When putting bees into new hives, be sure there is no corner or crevice where a moth can hide and a bee cannot follow. We have seen movable comb-hives with the frames touching the side, so that worms may hatch in many places undisturbed by the bees. Such hives are perfect nurseries for the moth."

THE Colorado Inter-Ocean says it is a question whether Colorado will ever again be seriously inconvenienced by the grasshoppers. Irrigation and the black spider are doing the work of destruction so effectively that the "hopper" of the future will have to seek some more sequestered vale if she wishes to deposit her eggs in peace.

LOVE is said to re semble the butter on bread Without butter the bread is dry and hard to swallow. So it is with love and life. . . . . Some one tells us that if you said no yesterday and have repented, you can say yes-ter-day and heal the wound. . . . . A box of Isabella grapes was sent to the Elmira Club, (as stated in the Husbandman) May 20th with the following note:

TANSVILLE, N. Y., May 19, 1881.

I send the Club, by express, a specimen of Isabella grapes, kept until now by simply placing them in packing boxes with alternate layers of paper. We have grapes preserved in this way to use during the Winter as freely as apples.

The above seems to us a very valuable item. . . . . "Talk of the safety of a hornless bull! A bull whose entire head had been bred off would be still dangerous if his disposition prompted him to rush upon his owner with hostile intent, says Mr. Gilbert in the N. Y. Tribune. . . . . Be brief, says a writer in the Boston Transcript in his rules to correspondents. Why? Because people don't read long stories. The number of readers which any two articles have is inversely proportional to the square of their respective length. That is: a half-column article is read by four times as many people as one of double that length. . . . . L'Estrange says: So long as we stand boggling at imaginary evils let us never blame a horse for starting at a shadow." . . . . . A man must reap as he sows. In a broken natural law there is, as Shakespeare suggests, "no more mercy than there is milk in a male tiger." . . . . . Some of us, says the N. Y. Times, will live long enough to find out that our fathers knew something, too. One of the vices of the age is the habit of thinking that nothing is worth knowing that is more than two or three years old. And an old idea, or method, or thing is considered worthless unless some one patents it as a new device; then it takes wonderfully But this is all wrong. . . . . No one can live between brick walls and teach those in God's open country how to grow fruit, says Green's Fruit Recorder—or to farm successfully either, we might add. . . . . "A man with a small head is like a pin without any—very apt to get into things beyond his depth."

"Willie, you can't eat another dish of strawberries." "Yes, I can, ma; one more dish will just fill your Bill." . . . . . Mr. Chas. A. Green says that a Connecticut farmer, who set out an elaborate scarecrow in his strawberry patch, was disgusted to find that a pair of robins had built their nest and were raising their young under its hat. . . . . "Four things to cultivate: sympathy, cheerfulness, contentment and strawberries." . . . . . "What do colored people do at their funerals?" "They go blackberrying." . . . . . "Kissing your sweetheart," says a trifling young man, "is like eating strawberries from your neighbor's garden after dark—it takes a long time to get enough. . . . . Is a mushroom city builded with toads' tools?

Everywhere.

RURAL SPECIAL REPORTS.

Arkansas.

POTEAU, Scott Co.—As a whole the outlook for crops is not as good as last year—too much rain. The acreage of corn is about the same as that of cotton—larger. No wheat, rye or barley. The acreage of oats is about the same as last year, and it bids fair for a good crop. The fruit crop is light and many trees are dying from the Winter's severity. J. C. B.

ROCKY COMFORT, Little River Co,—Wheat acreage very small and outlook not very good—say 10 to 15 bushels per acre. Oats a large acreage and fine yield—20 to 35 bushels per acre. Barley and rye none here to amount to anything. The prospect for corn is not so good as last year; acreage about the same. Orchard fruits are very nearly a failure owing to the late frost killing the young fruit. J. D. L.

WALNUT RIDGE, Lawrence Co.—No small grain raised in this part of the State. Corn is looking well although some of it will be late, as planting is going on now in mid-June. Cotton is not very promising; the weather has been too wet and cold although some patches are looking well—fully an average acreage. Very little small fruits. Plums are abundant; peaches a fair crop; apples a light one. T. W.

California.

BISHOP'S CREEK, Mono Co.—Grain acreage much more than ever before, and the outlook for wheat, barley and oats is more than usually flattering—wheat mostly Sonora. Our corn is farther advanced by two or three weeks than at the same date last year, with one-third more acreage. The country is new, with but few bearing orchards, but these are in fine condition and give promise of a good yield. The grass grown here is Alfalfa, yielding three crops in many instances. Our Winters are very favorable for stock raising, there not having been at any one time last Winter more than one inch of snow. Our mining interests never looked more favorable, furnishing a market at home for all we can produce. I. H. S.

DENTON, Denton Co.—Wheat, 75 per cent. of last year's acreage; yield per acre from 25 to 75 per cent.—Little Red May, Walker, Mediterranean and Boughton. Fultz promised splendidly, but proved late. Barley will yield only from seven to twenty bushels per acre; while a few fields of wheat will yield from 30 to 40 bushels. Rye will average about 15 bushels per acre. Oats are splendid, but the acreage is small as we had only poor crops for the last few years. The acreage under corn is about 25 per cent less than last year, and the yield per acre will vary from 70 to 20 per cent. less. Where well cultivated it promises a good crop; but two-thirds of it have received no attention and this will yield a poor crop. Small fruits, grapes excepted, are not successfully grown here; and fruit trees, peaches and plums excepted, do poorly. Ten days ago plums retailed at the stores here for twenty cents per quart. Now they are worth ten. Apricots, nectarines and the most early varieties of peaches are now ripe and ripening, and retail at 35 cents per dozen. Crop short. Cotton, our main crop, is overwhelmingly in the grass and lots of it irretrievably lost for lack of cultivation—cause, wet weather and scarcity of labor. Acreage 25 per cent. more than heretofore; but there will hardly be over 40 per cent. of a good crop. Millet—two varieties of German and one of Hungarian—is our best and only hay crop—acreage 50 per cent. more than usual; prospects 75 per cent. of a good yield. Early, good; late, a failure. J. H. J.

MT. EDEN, Alameda Co.—Chevalier and common barley looks very promising in this section. Some Chevalier will go as high as 40 centals per acre. Wheat showed rust, consequently it is mostly cut for hay. There are probably only about 300 acres planted to corn in the whole county, the largest area having been sown to Chevalier and common barley. The fruit crop is medium, for cherries, apricots, and apples. An abundant crop of pears, plums, peaches and nectarines, though reports from other places show some damage by night frosts. Small fruit, currants, raspberries, and blackberries are loaded. J. C. M.

SANDERS, Fresno Co.—I can see 12 000 acres of wheat from my farm; last year there were only 10,000 acres of wheat on the same area; 400 acres of barley—the same as last year. No

oats or rye raised. There are 500 acres of Doura, against 800 last year; 20 acres of Indian corn, against 12 acres last year. Yield will be 10 per cent. less than last year on dry land, irrigated land will equal last year's yield. Wheat on dry land will average 12 bushels per acre; on irrigated lands 50 bushels. Barley will yield 15 bushels on dry land and 50 bushels on irrigated lands. Indian corn, 15 or 20 bushels. Sanders is in the exact geographical center of our State. 'Tis 183 feet above the ocean level, in the "Great Valley" of California. We had 13 76 inches of rain last Winter. Have had no rain for two months now—nor will we have any more till November. The harvesting is about half done. I can see from the window by which I'm writing 13 headers at work. Each is run by from 12 to 16 horses (including teams hauling the grain) and cuts from 20 to 35 acres per day. Grain is already being thrashed and put upon the market. Wheat—Propo, Chili, Sonora (Red Mexican) Club and Australian; barley, common six-rowed; Doura, branching white; Indian corn, white and yellow dent. Doura will yield about the same as last year—from 25 to 100 bushels per acre. The crop of raisin grapes will be immense. Apricots are less than a half crop owing to late frosts. Peaches about two-thirds of a crop. Apples do.—for same reason. Peaches a full heavy crop. Nectarines a heavy crop—they always are; never fail. Too hot for currants or gooseberries. Strawberries, blackberries, and raspberries full heavy crops. W. A. S.

WATSONVILLE, Pajaro Valley, Santa Cruz Co.—The acreage of wheat in the counties of Santa Cruz, Monterey, San Luis and Santa Barbara is less this year than last, owing to wet weather at seeding time. The yield will be about one-half what it was last year and I think that is about the way it will average all over the State. The kinds we raise are Sonora, White Australia, Propo, Snowflake, Club and Odessa. The acreage of barley is larger than last year and is looking and yielding well. The oat crop is light but good. Corn about the same as last year, looking well. The apple crop is very light; in San Jose, one of our main apple sections, the crop is almost a failure—too many scale bugs. Cherries a large crop; peaches a good one. Apricots and plums fair. Small fruits big crops. J. A. B.

Canada.

INGERSOLL, Ontario Co.—Wheat acreage larger than last year; but under an average—Clawson and Fultz. Oats, peas and barley average crops. Corn poor; acreage double last year's. Hay a light crop. Apples under an average; small fruit prospect good. G. C.

MAITLAND, Ont.—Crops are looking grand. Fall-sown wheat is extra-fine. Hay, too is splendid. E. K.

Colorado.

DEER VALLEY, Arapahoe Co.—I am living at an altitude of 600 feet. The days are warm but the nights cool. The Winters are less severe than in the valley. I am located about 50 miles southwest of Denver, and about 60 miles east of Leadville. There are but few farms hereabouts; and while oats, wheat, rye, barley and peas all do well, they are raised mostly for feed. The mountains are more adapted for stock than for farming, and a large proportion of the grain is cut before it matures, to be used as fodder during the snow storms in Winter, and yet not one-half of the stock ever gets a mouthful of either hay or grain. Corn is not raised in the mountains, as the nights are too cool. It grows well in the valley in the vicinity of Denver. There are no orchards here yet. Some are trying small fruits with success. I have some which are looking very well. Potatoes are one of our best crops; I have raised them for several years; nothing seems to disturb them except grasshoppers and they will only eat potatoes when everything else is gone. The Colorado beetle I have never seen. All of the more hardy vegetables do well, such as beets, parsnips, turnips. The acreage under crops is hardly greater than it was last year, as the farmers are limited in land which is suitable for cultivation, and it is all sown every year. C. M. T.

FLORENCE, Fremont Co.—The area of wheat in this section is estimated at about five hundred acres; the average yield per acre is about 45 bushel; of oats about the same; no barley or rye. The prospects for corn are good, and the yield will be from ten to fifteen bushels per acre more than last year. The outlook for orchards and small fruit is also good, although not much of either is grown here, but a great many orchards were planted this Spring. J. C.

GOLDEN, Jefferson Co.—At least one-third more wheat was sown this year than last, and the prospect is good for a fair crop—White Siberian. A quarter more oats—black or mixed; outlook fair; very little rye; middling. Corn, ditto, ditto. S. B.

Dakota.

ALEXANDRIA, Hanson Co.—The acreage of wheat, barley and flax in this county is about ten per cent. greater this year than last, and that of oats about five per cent. The outlook for all is good for a full average yield per acre. The acreage of corn is about the same, but the prospect is better, because this year we planted on old ground and last year on sod, and the season being very dry the crop was not a good one. Vegetables grow very rapidly and luxuriantly. The country is still too newly settled for orchard or small fruits, but in the course of a few years I've no doubt there will be plenty of fruit grown here. H. B. H.

HILL CITY, Pennington Co.—This is not properly an agricultural section of the Black Hills. There are only about a dozen ranches within twelve miles of my place. I am situated in the heart of the best mining district in the southern hills. What crops are planted are looking splendid. But a small amount of wheat is sown. Oats, barley and potatoes are the chief productions, of which the increase is about double the amount put in last year—say 300 or 400 acres. No corn; this place is at too high an altitude. No orchards and no small fruits except wild raspberries and strawberries. Our ranches are situated on creeks, and are of a rich alluvial soil. Oats yield from 50 to 100 bushels per acre; barley from 30 to 60 bushels; potatoes from 200 to 400 bushels. Peas and almost all kinds of garden truck (except tomatoes, beans, cucumbers and melons) grow as well as in any part of the United States. C. H. W.

Florida.

LONGWOOD, Orange Co.—No wheat, barley or rye. In Winter some oats are sown for fodder, but very seldom for the seed. They would hardly pay cultivation. Generally rice is sown on low lands, and yields from 15 to 20 bushels per acre. Some corn is raised for home use, and it pays well on hummock lands. The average yield is from 45 to 50 bushels on hummocks and 10 to 15 bushels on pine lands. The acreage is one-third more than last year's. Market gardening was a success this year; the season was three weeks later than usual, but prices were high; the acreage was double that of last year. The prospects for the orange crop are very good; but we shall have few guavas, the frost having killed many bushes to the ground. Pomegranates, figs and grapes will pay very well. The White Elephant did well on my pine land. K. T.

TAMPA, Hillsborough Co.—Wheat, oats, barley, rye, etc., are not raised to any extent in our section. Experiments have thus far proved our soil ill adapted to their successful growth. Owing to a very unfavorable season the corn crop this year will be a failure; acreage increases with the yearly increase of settlement. Northern orchard and small fruits are not grown to any great extent with us. Of late years orchard fruits have been introduced, but as yet with no satisfactory results. Strawberries will do well in favored locations, but want of transportation will prevent their being cultivated for market for some time to come. J. A. J.

Kansas.

BAXTER SPRINGS, Cherokee Co.—An increased acreage was given to wheat last Fall, but a considerable part of it was winter-killed and the chinch bug has materially injured most fields—Black Sea or Mediterranean and Walker. Oat acreage small and outlook poor. Corn outlook is good; acreage somewhat above last year's, as many farmers plowed under fields of winter-killed wheat and planted corn. Apples a medium crop; peaches none; strawberries good; raspberries fair; blackberries mostly winter-killed; flax acreage pretty large and outlook good. L. T. S

VINE CREEK, Ottawa Co.—Not as much wheat sown as last year. As usual, most of what was sown is killed out. Of oats, barley and rye none is sown in this section. The prospect for corn is good; there is about 100 per cent. more planted than there was last year. There will be some small fruit; orchards are too young yet to bear. J. C. D.

Kentucky.

LONG RUN, Jefferson Co.—Acreage of wheat and oats greater than last year; wheat quite poor; oats, prospect good. Barley acreage greater; prospect fine. Rye acreage less, and prospect bad. Corn acreage about an average, and looking backward, owing to late Spring and bad seed; a great many had to plant a second or third time. Wheat principally Mediterranean and Fultz. The prospect for fruits is very good. J. L. G.

Michigan.

MANTON, Wexford Co.—Crops are looking very well except grass which will not be half a crop. Clover from new seeding, however, will be about two-thirds of a crop. Wheat well headed; rather short and thin; not as good as last year; acreage nearly double as much—mostly Clawson with a little Diehl. Oats look well; about one-third more sown than last year. Barley and rye but very little sown in this country. Prospect for corn is good; acreage about the same as last year. Orchard and small fruits are good, what there is. Ten years ago this was almost an unbroken wilderness, and as the G. R. and J. R. R. Co. owns every second section it keeps the country from settling up as fast as it otherwise would, but it is settling up very fast, nevertheless. D. C. C.

Mississippi.

BELMONT, Tishomingo Co.—Not one farmer in thirty sows any wheat. Oats are on the increase, 10 per cent. more having been sown this year than last; no rust as yet. Barley doesn't do well here. Only as much rye as wheat, because farmers do not know how to put it to use. The prospect for corn is exceedingly good—an increase of acreage over last year of about 30 per cent. The outlook for orchards is greatly on the increase. A great many orders were sent last Spring to the Nashville nurseries. Small fruits are altogether neglected. Corn and cotton are the main crops, though cotton of late is yielding to corn; farmers are getting tired of buying their meat and bread from the great Northwest. A. J. B.

Missouri.

CHILLICOTHE, Livingston Co.—Wheat badly winter-killed; corn, our main crop, like oats, grass and potatoes, is doing well. No barley and but little rye. Apples and small fruit not very promising. S. C.

Nebraska.

BEAVER CITY, Furnas Co.—A fair idea of our average crops in this whole section could not be given by comparing this year's with those of last, as all crops were then a failure on account of the drought, and half the settlers on that account left the country. Indeed none remained except those dwelling along the streams. Wheat now promises a large crop. Grass Wheat for both Winter and Spring with some Early May. Oats barley and rye are good, but little is grown from want of seed. The prospect for corn is good. Every farmer has planted from 10 to 100 acres where there was none at all last year. No fruit is to be found here yet, except the wild sorts of which there is plenty of currants, grapes and plums. C. E. S.

NEMAHA Co.—In this county Fall wheat is almost a failure. Spring wheat looks fair; the acreage will compare favorably with former years—White Missouri and Grass. Oats, rye and barley good; but not much sown. Corn looks well, but it is late, owing to heavy Spring rains; acreage 10 per cent. above any former year. Apples a light crop; peaches a failure; small fruits, fair. G. C.

OAKDALE, Antelope Co.—The acreage under small grains must be at least one-third more than last year's; outlook is good for wheat oats, barley and rye. Wheat, Grass; oats, common white, Norway and Surprise. The prospect for corn is very good; the acreage compared with last year's, is about twice as large. The prospect for orchard and small fruits is very good. All kinds of trees are growing very fast. J. B.

Texas.

BOSQUEVILLE, McLennan Co.—This section of Texas possesses the advantages of a good, healthful climate, productive lands, both timbered and prairie, abundance of fine water, and splendid mountain scenery. Railroads are penetrating the country from almost every direction. The acreage for wheat, oats and other small grains is the same as last year's. Harvesting finished and grain in fine condition; the yield, however, will be less than an average. The varieties of wheat generally sown are the Red May and Mediterranean and a little Tappahannock. The prospect for corn is very good; acreage about the same as last year's. This is a new country, and but little attention is given to the culture of fruits; apples and pears have usually failed; peaches, plums and grapes have given general satisfaction. A. Q. P.

PINE HILL, Rusk Co.—The acreage of corn compared with last year is about 102 to 105; crop well worked and doing finely; good stand; about as early as last year. Roasting ears will be beautiful by the Fourth of July. Oats about as last year in quality and quantity, harvesting commenced; wheat gets so little attention that it is not worth describing; but little grown. Barley sown only to graze stock. Rye about the same, though all but wheat do well here. Very few peaches in this county. A tolerable crop of apples—not good. Small fruits injured by frost. G. E. L.

Utah.

ST. GEORGE, Washington Co.—Strictly speaking, Southern Utah is not a grain-growing district, it is more suitable for fruits, hay, cotton, sorghum and garden truck. In fruits, we grow to great perfection *all* that are at home in the temperate zone, besides figs, almonds, pomegranates, and nearly all of the varieties of exotic grapes. Wheat, oats, barley and rye grow in perfection, and the area of wheat is usually large, and yields about an average of 25 bushels to the acre. The grain is of fine quality, but not enough is grown to supply home demand, and scarcely enough of oats and barley, as large quantities are required for feed in working the silver, copper, coal and iron mines—all the varieties best able to stand drought, and dry hot weather are chiefly used, such as "Club Head," "Taos" (Touse), etc. The prospects for a corn crop are good; the quick-ripening varieties are usually planted. Two crops a year are usually grown, unless it is planted after the wheat crop. The acreage of corn and small grains is much larger than last year, and the prospects of crops are far better, there having been a greater rainfall during the present season than during the last. The outlook for orchards and vineyards was never better than at this season. Berries and small fruits, however, are not grown to a great extent on account of scarcity of water and lack of humidity in the atmosphere. The chief products here are wine, Alfalfa (or Lucerne) hay, fruits, sorghum and honey, which are marketed in the mining regions, and cotton for the home factory. The dried peaches, prunes and grapes of Southern Utah are superior to those of most other regions and our pears are unexcelled. J. E. J.

Virginia.

RICHMOND, Henrico Co.—Wheat is a big crop; acreage larger than last year's. Winter oats is a poor crop; Spring oats is short but well filled; rye is good. The prospect for corn is good and the acreage is larger than last year's. Apples and small fruits plentiful; cherries ripe; apples getting ripe; currants and berries, ditto. Potatoes, both sweet and Irish, look well. Hay is a good crop here and is all cut, and so are wheat and oats. F. C.

Wisconsin.

GREEN BAY, Brown Co.—Growing crops look exceedingly well, and inspire the farmer with hopes of a bountiful harvest. In consequence of the failure of last year's wheat crop, on account of the ravages of the chinch bug and other insect pests, and the unfavorable weather, a less quantity of wheat was sown for this season. Winter wheat suffered considerably on account of the extremely cold weather in the fore part of Winter, without the protection of snow—White Russian, Silver Chaff and Clawson; Scottish Fife is almost exclusively used for Spring sowing. The acreage of rye and barley has been largely increased; outlook good. Corn also has an increased acreage, although it has never been a staple crop hereabouts. Grass looks well and promises a heavy hay crop. I have my first cut of Lucerne well cured and dry in barn. G. E. T. K.

The Querist.

ANSWERS TO CORRESPONDENTS.

Cotton Seed for Cows.

J. R., Lawrence, Texas, sends us a specimen of cotton seed and asks how much of it a day should be fed to each cow, and whether it could be considered cheap feed at seven cents per bushel of 32 pounds.

ANS.—The utilization of cotton seed is of the highest importance in all the cotton-growing States. This immense product very largely goes to waste, though, if well husbanded, it would do more to keep up the fertility of these States than all the commercial fertilizers purchased. Cotton-seed in its natural State, like the specimen sent, has two drawbacks—the short adhering cotton lint and the tough husk, rendering it less digestible, and yet it has a large value as a feeding stuff. If it is to be fed with its fiber and husk, it would be best ground with other grain—corn, oats, barley, rye or even wheat bran. It contains so much oil (30 per cent.) that it cannot be ground in an ordinary mill with a less proportion than four of corn or other grain to one of cotton seed. The proportion of oil is too great to be fed largely as a single food. If fed largely to milch cows, it would give a disagreeable flavor to the milk and butter. Not more than four pounds per day could properly be fed to a cow in milk. Decorticated cotton seed (seed with husk and lint taken off) is excellent food in moderate quantity, for cows in milk; and the decorticated cake, after the oil is expressed, is largely used by dairymen in some of the Eastern States—about four pounds per cow per day. Cotton seed is a highly nitrogenous food (in the raw State, 23 per cent., and in decorticated cake, 38 per cent. of albuminoids) and is thus well adapted to produce the caseine or nitrogenous part in milk. The raw seed has a much greater value for Winter feeding than our correspondent mentions (seven cents for 32 pounds); as a part of the food it is worth more than corn per weight. Its oil and muscle-forming matter render it very appropriate additional food to hay or corn fodder or even straw. It has sometimes been boiled to render the husk more digestible. When the seed, boiled or raw, is fed to cattle, it is well to mix it with cut hay or straw or other coarse fodder; but where straw-cutters are not used, spread a thin layer of hay or straw in the bottom of the manger, and then spread the seed upon this, and the animals will eat more or less hay with the seed, which renders the food more bulky in the stomach and therefore more digestible. At the price our correspondent mentions ($4 37 per ton) cotton seed would be a cheap application as a manure; 2,000 pounds of it contain

32 pounds of potash, 45 pounds of phosphoric acid, and 60 pounds of nitrogen. These are worth, at the lowest price sold in commercial fertilizers, $15. The manure made from a ton of it, after being fed to cattle, is worth much more than the seed costs at the above rate. This plain statement shows the need of reform in Southern husbandry to prevent great waste with this article.

Giant Powder as a Stump Extractor.

T. D. W., Little Welf, Wis., and several others elsewhere, ask a number of questions about the use of giant powder for blowing up stumps, etc., all of which are here answered.

ANS.—Giant powder and dynamite are two names for the same thing, a sort of silicious earth saturated with about three times its weight of glycerine, and resembling damp Graham flour. There is some danger attending its use, of course, but it is generally considered the safest of violent explosives. There are two kinds of powder, known as No. 1 and No. 2. The first is the more powerful, and is therefore used for heavy work; it costs $1 a pound. The second is the less powerful, but quite strong enough for blowing up stumps or blasting rocks on a farm; it sells for 50 cents a pound. The powder is furnished, either loose or put up in cartridges, in boxes of 25 or 50 pounds each. In appearance a cartridge is much like a candle. It is eight inches long and of any required thickness. All who wish to use the explosive, unless they are experts, should employ the cartridges only. They are made by one firm exclusively—so far as we know—the Atlantic Giant Powder Co., Varney & Doe, agents, 59 Park Place, this city. These agents do not supply private parties, mainly on account of the objections to transport it to a distance in smaller quantities than those mentioned. Should any one apply to them, however, they will send him the name of the nearest agent through whom a supply can be obtained. Full instructions for using it are furnished with each amount sold. The cartridges are exploded by caps made for the purpose, and these are ignited by means of a fuse. The caps cost $2 per box of 100; the fuse costs 75 cents per 100 feet. A pair of nippers—price 50 cents—are also handy. Whenever a considerable number of stumps or rocks are to be got rid of in any neighborhood, it would "pay" those who intend to blast them with giant powder to unite in hiring an expert to do the work.

Ducks.

M. G. H., Millerton, N. Y., asks, 1, the best way to raise ducks; the best for home use and market; what is the distinctive value of pure white ducks.

ANS.—We have found that to keep ducklings warm and dry till they are feathered is the best way to rear them safely. Then they will do well if they have access to water wherever this is convenient. To decide which breed is the best for the above purpose is no easy matter, for some people prefer one sort, and some another, and each prominent breed has its enthusiastic advocates. Some raisers of ducks are loud in their preference for the Rouen for table; others like the Aylesbury better. In our experience it has been impossible to tell one sort from the other when cooked where there was no foreknowledge about the matter. Probably no one could distinguish any difference in taste between them, if both were fattened and served up alike. The Aylesbury, Call and Pekin ducks are white. White ducks are preferred by many on account of their plumage, white feathers being preferred to those of other colors. Pekin ducks are very excellent layers, besides being very good table fowls.

The Seventeen-Year Locusts.

J. W. H., Paducah, Ky., says there are millions upon millions of the seventeen-year locusts thereabouts, and he asks how they are generated—do they produce eggs, and if so, after that, what.

ANS.—The seventeen-year locust (Cicada septendecim) lays its eggs in the bark of trees. They are about one-twelfth of an inch in length and of a pearl-white color. They hatch in about six weeks. The young cicada is very active and soon casts itself to the ground, in which it burrows down, and subsists on the exudations of rootlets. It has been found to the depth of 10 and 12 feet. According to Harris, it remains there until 17 years have elapsed, when it ascends to the surface. It then prepares to cast off its "old clothes," and by repeated exertions makes a longitudinal rent in its skin on the back, and the cicada becomes a winged insect. In about a fortnight after its final transformation it begins to lay eggs, and in about six weeks the generation ceases to exist.

A Curious Case.

G. H. P., Brooklyn, N. Y., says:—"I have a field in which I raised good millet when manured with phosphate; then I used barn-yard manure and got a good crop of wheat, but the grass seed did not "catch"—on account of dry weather, I suppose. Last Fall there was on it a good stand of rye, but grass seed "took" no better. In Spring clover was sown on it, and the field is now covered with sorrel. What is the difficulty, and what the remedy? Soil granite gravel."

ANS.—Such a case has never occurred in our experience. We have submitted the question to several excellent farmers, who agree essentially with Mr. Talcott, who writes as follows: "I submitted this case to the Central New York Farmers' Club at their last meeting. The Club decided that Mr. P.'s description was not full enough to give a definite answer; but they suggested that lime, ashes and salt be used as a corrector of the acidity in the soil; also that a dressing of clay (if to be had) would be beneficial in such a case."

Treatment of Bloated Steer.

W. H., Galt, Mich. has a three-year-old steer that bloats badly, especially on the left side. It has been wintered poorly; it is a good feeder and our friend asks how to treat it.

ANS.—Cows and oxen always bloat most on the left side as the paunch lies there. Bloating is caused by indigestion and indigestion may be caused by poor feeding or over-feeding. To remove the trouble give the steer a pint of linseed oil and repeat if necessary to clear out the bowels. Then give every day a tablespoonful of salt, with half as much carbonate of soda and a teaspoonful of ginger mixed together. After a few days, the mixture may be given twice a week and after some time longer, give it every week, or as long as the steer shows any symptons of indigestion.

Corn Bran for Feed.

J. M. Selma, Ala., asks how much corn bran should be fed daily to milch cows together with other feed. He is now feeding about four-quarters of corn bran, a pint and a half of cotton-seed meal, and one quart of corn meal to each cow every day in two meals, but they are getting rather too fat for milch cows.

ANS.—Four quarts of corn bran and one pint and a half of cotton seed meal will be ample daily feeding for a cow, without any corn meal. The corn bran contains the oily part of the grain, with most of the nitrogen, and when fed with cotton-seed meal it makes a very fattening food, as well as a very healthful one. To reduce its fattening tendency a quart of wheat bran might be substituted for one quart of the corn bran.

Quack Seed Wanted.

J. G. Livingstone, Lewis, N. Y., says: "I have just seen an article in the RURAL about Quack Grass (Triticum repens). I want two sacks or bags of the seed. I want it for sandy land because its roots are so tenacious and wide-spreading that it will not let our strong winds blow the soil away. I do not know whether any seed store keeps, or whether any one ever saves the seed for sale. If any man will send me two bags of it I will send him the money by return mail, at the price of Timothy seed."

How Can Irish Potatoes be Kept in the South?

"*Buckle*," *Stormville, Miss.*, asks the above conundrum, and some of our Southern readers would oblige us by answering it through our columns.

Miscellaneous.

C. D., Mt. Cisco, N. Y., asks, 1, whether the Agricultural Reports are furnished gratis; 2, how to obtain information about the fitness for farming of the eastern slope of the Blue Ridge, N. C.; 3, what is a reliable work on dairying and dairy cows.

ANS.—1. We suppose the Reports of the U. S. Department of Agriculture are referred to: these are furnished *gratis* through members of the United States Senate or House, to whom application should be made, each applicant addressing either the Senator of his State or the representative of his district. 2, Write to the Secretary of the State Board of Agriculture, Raleigh, N. C. The best work on dairying and dairy cows is Dairy Farming by Prof. J. P. Sheldon, now being published in monthly numbers—price 40c. each—by Cassell, Petter, Galpin & Co., 596 Broadway, this city. The 19th number of this splendid work has already been issued, and it will probably be completed in about half a dozen more. Willard's Practical Dairy Husbandry, $3, is also a good work—to be had through the American News Co., this city.

R. M. T., Philippi, W. Va., 1, having found some wild strawberry vines that produce berries an inch in diameter, asks when should he transplant them to the garden with a view of cultivating them so as possibly to obtain a valuable new variety. 2, He has some specimens of the Yucca filamentosa planted in April 1880, and now five feet high and still growing, and he asks whether it is a common thing for the plant to grow so tall.

ANS.—The wild plants which bear berries an inch in diameter should be transplanted to the garden, say in August or next Spring. They may prove worthy of cultivation. 2. Unless you have reference to the flower stalk, no; otherwise yes, and taller. In previous seed distributions the RURAL sent out seeds of this fine plant.

B. F. T. & Co., Humboldt, Miss., have a clover field which was plowed under last August with the intention of planting it to corn last Spring; but there was then so fine a stand of young clover that it was thought best not to put in the corn. Weeds, however, came up nearly as vigorously as the clover, and as they, if not cut, would be in the way of next year's crop and damage the hay, they will be mowed down to prevent this and give the hay a better chance, and right here comes in the question which is referred to us:—Junior says, "Rake them up and take them off;" Senior says, "Let them lie as a mulch to protect the clover, should a drought come."

ANS.—Cut before maturing seeds, we should by all means let the weeds remain.

E B, Austinburg, O, has a three-quarter-inch lead pipe from a spring to a trough 12 rods away. In Summer the water often stops running, but when once it is started in the Fall it keeps on running right along all through Winter, though the water in the Spring is the same hight all the time, and we are asked for the cause of the Summer stoppage, and whether an inch pipe would be likely to prove more regularly accommodating.

ANS.—It may be that the Summer vegetation—leaves, flowers, stems, etc. that collect upon the surface water of the Spring—obstructs the pipe. When cleared in the Fall this possible cause no longer exists. A one-inch pipe would be less liable to be obstructed.

R. S M, West Spring Creek, Pa., incloses two thread-like worms which he found when plowing greensward, and wishes to know what they are.

ANS.—They are the so-called hair-snakes or hair-worms. These entozoans are all parasites upon insects in one form or another. Some species are first parasitic upon aquatic larvæ; then live in the stomachs of fishes and, later, in some unexplained way, make their way into land insects. They leave their hosts to lay their eggs, and in this free state are often found. It is probable that some species undergo their entire transformation on land.

S W. P. Madrid, N. Y. says: "I send by mail specimens of a worm which is making great havoc in pastures. It somewhat resembles the Army worm. The roots of the grass are not injured, but the grass is cut off close to the ground. Can you tell me what it is?"

ANS.—The specimens did not arrive; but from the description we should pronounce it the Bronzy Cut-worm, the larva of Nephelodes violans. The worm is striped and of a bronze color when full-grown. It will probably not prove as injurious as the Army-worm.

E. H L, Homer, N. Y., asks, which is the colder—the arctic or antarctic region.

ANS.—Appleton's Cyclopædia—a good authority—under the heading Polar Seas, and subheading, Antarctic Ocean, in speaking of the antarctic region, says: "With regard to the climate, observations, deficient as they are, still point conclusively to the fact that the Winters are milder and the Summers cooler than in the North polar regions, thus indicating a more maratime climate caused by a less amount of land." We see no reason for disagreeing with Appleton's.

W. B. K, Abingdon, Va, sends a couple of samples of minerals to find out whether they are valuable.

ANS.—The larger greenish sample is chlorite—of no value. The small light-colored sample, wrapped in newspaper, contains considerable *gold* and would indicate the proximity of rich deposits. We would advise our correspondent to have an assay made of this mineral, for which a sample weighing three or four ounces would be needed. A. R. Ledoux & Co., chemists and assayers, 17 Cedar Street, this city, are a trustworthy firm who do that sort of business.

F. C. W., Orion, Ill, wishes to know if the Persian Insect Powder is poisonous to animals; 2, how shall he apply it.

ANS.—1, It is not. Therein it has an advantage over Paris-green or London-purple. When breathed it is no more disagreeable than any vegetable dust. 2. Mix with flour in the proportion of one part of the pyrethrum to 20 parts of flour or a tablespoonful of the powder in one gallon of water will prove effective. The point is to bring the poison in contact with the insect when a very little of it will do the work.

A Subscriber, Blackstone, Mass., asks what makes his half-grown cherries drop off the trees; there is no visible worm; the trees appear healthy, and made 18 inches of new wood this Spring.

ANS.—We have observed that after a full-bearing year cherries may bloom and set well the next year, but the fruit falls off before maturity. Too much rain or too much dry weather may cause the trouble.

G. C., Blandford, Mass., asks whether, under favorable conditions, the Rural Branching Sorghum will ripen seed in that latitude—about 43 deg.

ANS.—Probably not. This is not material, however, so few seeds suffice for an acre that, as seeds mature abundantly in many parts of the country, the price of enough of them for ordinary purposes is a mere trifle not worth considering.

F S L., Smithfield, Va., asks, 1, where can the Beauty of Hebron Potato be had, 2, when to sow Bermuda Grass.

ANS.—1, The Beauty of Hebron was introduced by the RURAL NEW-YORKER and is for sale by all seedsmen. 2 Bermuda Grass does not seed in this country. Cuttings of the roots are usually made in Spring, spread over the ground and dug or harrowed in.

J. S, Greenville, Pa., asks, 1, for directions for training a shepherd dog to drive cows; what set of words should be used; 2, are kidney pads of any benefit.

ANS.—We could not give such instructions very well. One set of words is just as good as another. It is quite conventional. We know nothing about the kidney pads.

H. B, Jonesville, Mich., asks where the Westcott's Return Butter Pail is made.

ANS.—It used to be made by Silsby and Karns, Belmont, N Y, but it seems to have been too high-priced; for after conducting the business several years, they abandoned it as unprofitable. We do not know whether it is or is not manufactured anywhere now.

G B, Adamsville, R I, asks how to cross two varieties of corn.

ANS.—As good a way as any is merely to cut out the tassels of one kind so soon as they appear. Then the silk (pistils) will receive the tassel dust (pollen) from the other kind. Of course, the two kinds must bloom simultaneously.

G W S, Patchogue, L I., asks how to get rid of the apple tree aphis and the pear tree slug.

ANS.—A syringing with tobacco water, whale-oil soap or Paris-green will kill the aphis. For slugs, add a little plaster to very fine coal ashes, and when there is no wind throw this *up* into the tree so that it will settle upon both the under and upper sides of the leaves. It *must* be dry.

J P. C., Union Co., Pa. asks the best way to kill Canada thistles.

ANS.—If the patch is small one can afford to give the time necessary to their complete extermination. Wait until they are in bloom. Then cut them down and dig up the roots thoroughly. Some plants will again appear; dig these up at once.

"*Sub*", *Cave Spring, Ga.*, asks what to do for the blight that has befallen his roses, owing doubtless to the severity of last Winter—abundant blooms but none perfect.

ANS.—We should rather attribute this to too much wood or rather to an impoverished soil than to the cold of the past Winter.

J. W. B, Barre, Mass., having his pastures injured by a curled fern, locally called "Pod," asks how to kill the pest which has a strong hold on life.

ANS.—It is the common Polypod—Polypodium vulgare—we presume. Plowing and cultivating will subdue it.

R. W. E., Riley Center, Kan, sends for name a head of grass which he takes for June Grass.

ANS.—No, it is Orchard Grass—Dactylis glomerata—one of the most valuable and widely known of all the pasture grasses.

G M. T., Factory Point, Vt, asks whether the R. B. Sorghum should be cut before it seeds.

ANS.—It will not seed in Vermont at all. It is best to cut it when four or five feet high and let it continue to grow.

L R. McA, Lynn, N. C., sends a specimen of grass and asks "What is it?"

ANS.—It is the common Canary Grass—Phalaris canariensis. It is cultivated for the seed for canary birds.

H. N. P, Walton, N. Y., asks how to apply land plaster to corn.

ANS.—We should sow the plaster the same as any concentrated fertilizer—then cultivate.

G. W. H. North Sanford. N. Y., asks where can he get parts of the Clipper Mower.

ANS.—From the Clipper Mower Co., Keene, N. H.

W. E. W., Cornwall, Vt., wants a remedy for grubs that are injuring grass at the roots.

ANS.—We do not know of any, unless to plow it up.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, JUNE 25.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, JULY 2, 1881.

THE most profitable method of rearing cattle is to give them all the food they can digest well from their birth up to the day of their slaughter, if reared for bullocks. But if for making oxen and bulls and cows for breeding, then feed no more than to keep them in prime working and breeding condition. An ox may be too fat or too poor for good work, and so may a bull to get first-rate offspring or a cow to do well in the dairy or as a breeder.

THERE is one promise we made to our subscribers in connection with the seed distribution that we did not keep. It was to send off the seeds in the order in which the applications were received. For this we apologize to our readers, many of whom have justly complained of neglect. Those who first come should be first served, and we shall endeavor to make the promise good in our next distribution at least, which, beyond asking forgiveness, is the best we can do. The kinds for our next Distribution are already nearly settled upon, and we have reason to hope will please our friends better than any of our previous efforts in this direction. Most of the kinds are now growing at the Rural Farm, so that there will be less chance of delay and disappointment.

TO REGULATE THE BEARING OF APPLE TREES.—This is a perennial subject of discussion, but no suggestion in regard to it has ever been made practical except the one which dictates careful attendance and the moderate annual pruning of the trees, with high fertilization of the soil. All the famously productive apple trees on record have stood in a rich soil, moist, but not wet. Careful pruning, manuring and mulching will, as nearly as possible, secure good annual crops from apple trees of any variety worthy of cultivation. Under this system a small orchard of William's Favorite near Boston is the chief support of a family. Thirty-eight trees of Fameuse in a city lot of about half an acre in Montreal, produced, in 1879, fruit that sold for $800, and the crop is rarely much less. These facts point to the remedy for the shy or intermittent bearing when the variety is naturally productive.

THE GOOSE FISH.—The ichthyophagists (short for fish-eaters) reveled in luxuries of razor clams, horse-shoe crabs, water-snakes and other delicious tidbits at Starin's Glen Island on the 26th. An especial feature of this ichthyophagous lunch was the goose-fish, one of the ugliest living things ever modeled by nature, yet a delicacy in which the ichthyophagists especially delight. It is a large fish, some four or five feet in length and weighs sometimes 75 pounds, but it is none too large for the name it bears. Cuvier called it *Pectorales pediculati*, an acanthopterous fish of the lophoid family, but "common folks" call it simply goose-fish, sea-devil or wide-gab. The latter name is most applicable if we consider that entire sea-fowls, such as gulls and ducks, have been found within its "bosom." We hope the "thing" can be appreciated by some one—we prefer *shad*.

CROPS.—From the great number of "crop reports" received from our kind friends during the past week, we present elsewhere to our readers a few specimens mainly from those parts of the country that were unrepresented in our regular Crop Number of last week. Neither these nor the many others we have since read, however, make any material difference in our expressed estimate of the approaching harvest; for in it we made considerable allowance for the beneficial effects of the late rains. From all reports the advantages from these have been very great to the growing grain and grass crops, especially in the Spring wheat region of the Northwest, whence glowing accounts of the outlook for harvest are now promising a yield per acre even larger than that of last year, but it is not denied that the aggregate acreage is less. The outlook for corn, however, has decidedly improved.

PRESSURE FOR ENSILAGE IN SILOS.—One matter of inconvenience in ensilage is the loading down of the ensilage with heavy stones or other weights which necessitate a great amount of hard labor. It has seemed to us that some device for giving the required pressure might be originated which would do away with the stone weight system, and we understand that Mr. George T. Powell, of Ghent, N. Y., is about to make the trial with screw-power. In the long walls of the silo eight one-and-a-half-inch iron screws have been built, each having a thread four feet in length and furnished with a suitable nut. The ensilage will be first covered with planks, across which, and parallel to the long walls, two or more timbers will be placed, and at right angles with these, timbers with holes near the ends, for receiving the iron rods mentioned, will be screwed down far enough to furnish the required amount of pressure. How the device will succeed remains to be seen; at any rate we do not predict failure.

WATERING HORSES.—One thing in the treatment of work-horses in hot weather we are disposed to deprecate, viz.: the custom of watering them three times a day and no more. It is simply cruelty on the part of man towards his beast, to compel the team to plow or mow from early morning until noon, or from noon until night without allowing it the privilege of a refreshing draught. It *is* inconvenient, many times, to water the team during the forenoon or afternoon, and we are apt to think the time thus taken, lost, but when the farmers' millennium comes, there will probably be drinking troughs in every field, supplied from some elevated spring or from a running stream. In the meanwhile, time "lost" in doing good, even though it be in behalf of the dumb animals, is well "lost"—it may be regained. Could they speak it might be to say that they would like to be treated, in the matter of *times* for food and drink, somewhat as we—their wise masters—are accustomed to treat ourselves.

IMPROVED BUCKWHEAT.

IT is said, in Christy's New Commercial Plants, that the Tartarian Wheat (Polygonum Tartaricum) ripens more quickly, has a hardier habit, and is less liable to suffer from the inclemency of cold summers, or of mountainous exposed districts, than the common buckwheat (Polygonum Fagopyrum), and when grown as forage, is also more productive and more nutritious. It also flourishes on poor, or badly prepared, or light, sandy soils. It produces more foliage, larger seeds, and agrees better with animals fed on it, than the ordinary kind. It can also be sown both earlier and later in the season than the common buckwheat. It largely increases the flow, and adds to the richness of cows' milk; while it fattens pigs and poultry of all kinds rapidly, and imparts to the latter when served up on the table, a delicious flavor. When fattened on this, mixed, half and half, with some other grain, a few days previous to killing, poultry always brings an extra price.

We wish our seedsmen would import some of this Tartarian Buckwheat, and disseminate it over the country, as it would be particularly valuable to cultivate on the poor, sandy soils of our seacoast, in mountainous districts, and the more northern latitudes of America, where the seasons are short and precarious.

FRANCE AND ITALY.

THE present diplomatic relations between France and Italy are greatly strained; and should war not immediately result from the hostile feeling it will be mainly due to the consciousness of Italian statesmen that unaided Italy cannot hope for success in a struggle with her formidable neighbor. The latter's occupation of Tunis, despite the machinations and protests of the former, has bitterly exasperated the public sentiment of the entire Peninsula, and already the government has had to take measures for suppressing turbulent public manifestations of hostility. Although both belong to what is called the "Latin" race, it is doubtful whether there are any other two countries now in Europe, or indeed on the globe, whose sentiments are so mutually inimical as those of these two rivals on the Mediterranean. Frenchmen may hate the Germans as heartily, but this hate is tempered with a dash of fear or respect, whereas their hatred of Italy, which owes its existence as a nation to French arms and which ungratefully went against France in the hour of her distress, is embittered with contempt. Italians, too, may hate Austria, their old-time oppressor, as fiercely, but from Austria they have nothing at present to deprecate or dread, whereas France has just humbled their pride and is still threatening their influence by the virtual annexation of Tunis. In Great Britain and Germany where public sentiment is moderate in its expression, war is the result of government deliberation and decision; but in ardent Italy there seems considerable danger that the popular exasperation may force the government into hostile action. In any event, the danger of a European conflagration has shifted from Turkey to Italy.

THE RURAL'S EXPERIMENT CORN CROP.

QUITE a number of our good readers and friends condole with us that our main field of corn (that of which a diagram was given in a late number) is likely to prove a comparative failure. But we are scarcely entitled to any sympathy. If the results of experiments were known before they were tried, there would be little use in trying them. Experiments which are far removed from ordinary methods imply risk, and we look for failure oftener than for success, though as we have before shown, success is sometimes met with when least expected. We knew that the soil of that field was very poor; that the "sod" to be plowed under was hardly entitled to the name; we knew, in short, that we had to depend in the main upon superior cultivation for our crop of corn. It is unfortunate that the season has been so exceptionally unfavorable, for many will be unwilling to concede to thorough cultivation the half of what it is richly entitled to.

Our manured plots of corn elsewhere on the farm are looking well for the season, though in them the stand is bad and we have no expectation of anything like the yields of last year.

The plots (one-twentieth of an acre each) in the unmanured field, upon which were used different kinds of concentrated fertilizers, show a marked difference in the size and color of the plants. One of the experiments in this field to which we look with interest is, whether the acre manured with 600 lbs. of special fertilizers will yield enough more grain than the rest of the field to pay for its extra cost. The stand is, in this acre, no better than in other parts of the field, so that the use of chemical fertilizers sown broadcast and harrowed in, has little effect to insure a better stand. Had it been *drilled* in, possibly it might have been otherwise. Our implement manufacturers should devise a machine that would drop a kernel of corn every three inches and sow concentrated fertilizers at the same time.

CROPS IN EUROPE.

WHOEVER has watched the late European cablegrams concerning the condition of the crops must be convinced that the greater part of them embody mere rumors circulated by speculators, principally on this side of water, to raise or depress prices in the interest of their own schemes. The only way to determine the degree of credit that should be accorded these announcements is to compare them with the regular weekly crop reports published in European agricultural papers. True, these usually reach this side of the Atlantic from ten to fourteen days later than the cablegrams, but as it is highly improbable that any very material injury or benefit should occur to crops generally in that interval, when any great difference is reported, it is safer to trust the agricultural papers, which are nearly always honest, than the cablegrams, which are often "meant to deceive." From a careful study of all attainable reliable sources of late information, we have come to the conclusion that Europe this year will be more nearly self-supporting than it has been at any time since the recent enormous increase in the production and exportation of American cereals. Although the production of breadstuffs in the United Kingdom will not be as great as it was before the present era of agricultural depression, yet it seems now certain that the harvest there will be at least moderately good. The latest reports, both by mail and cable, while still speaking despondently of the agricultural condition as a whole, give strong assurance of a condition of crops less unsatisfactory than at the corresponding season within the last five years.

The present condition of the growing wheat in France, according to the latest received issue of the *Semaine Agricole*, is admirable and still later cablegrams confirm the statement. For the first time since America began to supply the deficiency of French crops, there is a fair prospect that France will produce more than enough of wheat to supply domestic consumption, and all other crops, too, seem to be doing fairly.

In Germany the wheat and rye crops are likely to turn out an average, and the latest advices, both telegraphic and mail, from Austria-Hungary, the Spanish Peninsula, Italy, Switzerland, Bulgaria and Roumania, all speak in enthusiastic or hopeful terms of the outlook for the harvest. Of all European countries, however, the prospect in Russia seems the most favorable. Reports from Odessa, Taganrog, Sebastopol, Nicalaieff and Carkow, all unite in prophesying a better wheat crop in Southern Russia this year than in the last twenty. Some time must yet elapse before the European harvest, however splendid, can come into market, and the needs of the various countries must until then, be supplied mainly from this country. It is therefore not improbable that the coming harvest has assumed a brighter hue both from contrast with the late gloomy ones and from a not unnatural desire to lower the prices of the breadstuffs that may be wanted from abroad before the days of plenty, by showing how slight will be the demand for any foreign surplus when once the home harvest has been gathered. After having made all reasonable deductions, however, on the score of exaggeration, it seems highly probable that almost the only European market for our surplus breadstuffs next Fall and Winter, will be in the United Kingdom, and while the need of foreign supplies will be somewhat less there than last year, the competition between foreign surpluses from Russia, Egypt, India, Australia, New Zealand, South America, the United States and Canada, will be keener than ever before.

BREVITIES.

IN Osceola, Mich., a frost occurred on the 21st and 22d ult. It did little damage our correspondent informs us.

AND yet again:

DEAR RURAL: I received the Charter Oak Plow you sent us as a mangel premium, all right. Please accept my sincere thanks for the same. Yours, truly.

Maitland, Ontario. EDWIN KEELER.

THE wheat crop of the United States for 1879, according to the report of the Department of Agriculture, was 448,756,630 bushels grown on 32,545,950 acres, whereas, according to the late census, it was 459,591,093 bushels, grown on 35,487,065 acres—an increase of 10,834,463 bushels and 2,941,115 acres.

MANY extremely interesting reports have been received from our readers in various parts of the country for which we shall be unable to find space. We thank them all the same; beg their indulgence and ask them to favor us occasionally in the future. We would say also to our regular contributors that it is beyond our control that the Special RURAL NEW-YORKERS should interfere with the timely presentation of their articles.

RUBBING the muzzle with Barbadoes tar has proved an effectual preventive against foot-and-month disease in cattle in every instance reported on lately in England. This is a very cheap and simple remedy, and we hope whenever cattle may be thus affected in our own country it will be tried. We know that common tar applied to the nostrils of sheep keeps off the destructive gad fly (Œstris ovis); it is also beneficial for various ailments, applied alone or mixed with sulphur.

MR. LANGSTER died the other day—Mr. Langster, originator of Langster's No. 1 Pea, better known as Daniel O'Rourke. It is now 29 years ago since he entered the pea for trial at Chiswick, in 1852. That year the celebrated race-horse Daniel O'Rourke won the Derby, and in commemoration of the event Mr. Langster gave the name of the winning horse to Langster's No. 1. Since then this excellent pea and its dark green, vigorous vine have become highly prized on both sides of the Atlantic, while few have known even the name of its originator.

A GREAT PROFIT IN THE PURCHASE OF A HIGH-PRICED SHORT-HORN BULL.—At a luncheon preceding the Siddington sale of Short-horn cattle in England, Lord Fitzhardinge, who presided, alluding to his purchase a few years ago of a Short-horn bull for 4,500 guineas ($22,500), said people thought he was a fool for doing so; but he was happy to add that up to last year in sales and services the animal had earned him 7,000 guineas ($35,000), besides getting him stock which the exhibits from Berkley Cattle Farm (his residence) showed had never been beaten.

REDUCTION OF LETTER POSTAGE.—The Postmaster-General is doing a commendable work, and the country is to be congratulated on having so efficient an officer in that place; but if he wants to strike the chord that "makes the whole world kin" he will use his best energies to secure a two-cent or even one-cent letter postage. If a postal card can be delivered for one cent, a letter can be for two, and that, too, to any part of the United States. There is a growing public demand for such a change, and we predict that it will come to pass in the no distant future. If the Postmaster-General succeeds in reducing the cost of the postal service a million of dollars by July 1st, as he expects to do, it will be a long step toward other needed reforms, among which the reduction of postage may be reckoned.

Miscellaneous.

RURAL BRIEFLETS.

THE following comes to us from a friend near Memphis, Tenn. We have examined the flower spikes but do not find any seed: "Inclosed please find some Bermuda grass seed plucked in my yard. I see the matter discussed in your paper, whether or not it bears seed. Cattle like it better for pasture than anything else—they will even quit the clover field and go to the Bermuda. There is no way of killing it except to plow it up in Winter. It will destroy anything in the way of crops, as it runs over anything, and I have seen it destroy small shrubs or rose bushes when it was permitted to grow near them."....

MR. CHARLES DOWNING says of the Bidwell that it is the most productive of all—he was examining Mr. Roe's 100 varieties—of very fine flavor, very uniform in shape, averaging large to the last, of a bright glossy crimson color often with a glazed neck, and in shape much like an inverted bell-shaped pear; as early as the Duchess; flesh solid and meaty. This is high praise from a high source.....

MR. ROE kindly sent us a fine plant of the Bidwell strawberry in a pot. The whole number of berries on this plant was 110. Twelve were fully ripe, seven turning and 91 green. Five were large, seven an average size, and the rest smaller,.....

ROSE bugs are best exterminated by hand-picking. It is a good plan to carry in one hand a can of water and kerosene and throw the pests into it as fast as picked; or the can may be held under the Rose bugs where the branches admit of it, and a slight tap will cause them to fall. Our grape blossoms usually escape the ravage of this insect for the reason that there are so many plants blooming at about the same time, which they much prefer—Spiræas sorbifolia and opulifolia, and also some of the herbaceous spiræas.....

A FRIEND writing from Stormville, Mississippi, says; "The seeds distributed by you last Spring—the Elephant Potato, Rural Branching Sorghum, etc.—I have taken personal care of, and they are all in fine growing condition; but I cannot report on anything except the Sorghum, which is up to your representations and as pretty as a picture, three feet high and averaging about ten stalks to the seed. I had only about a dozen seeds to come up. The potatoes seem to be doing splendidly. I am unable to say whether they are making well or not, not having tried them."....

THE general opinion is that in breeding, especially in the case of horses, the male gives the locomotive system and the female the vital one.....

IN 1770 a hornless bull was produced spontaneously in Paraguay, South America, and this has become the progenitor of a polled breed that has multiplied extensively in that country.....

IN cattle small bones indicate good feeding qualities, early maturity and fine-grained flesh; while coarse, large bones, with prominent joints and angular projections, indicate poor feeding quality, late maturity, and coarse flesh, together with a large proportion of offal and cheap pieces in the carcass. An excessive refinement of bones, however, indicates a delicacy and over-refinement of the whole system. The parts of the body not deeply covered with flesh, such as the head, legs, tail, horns, and hoofs, furnish the best indications of the size, texture and proportions of the bones on the rest of the body.....

THE tendency to lay on fat rapidly and to mature early is inherited not only in a general way by such breeds as the Short-horn, Hereford, Polled Angus and Devon, but also in a special way by certain families in each of these breeds; and the predisposition to obesity is observed to be so strong in some cases as to be developed under privation and hard labor.....

BOOKS, CATALOGUES, ETC.,

PROSPECTUS OF AMHERST COLLEGE SUMMER SCHOOL OF LANGUAGES.—The next session begins July 12 and ends August 19, and is in charge of Professor Sauver. The so-called National method of teaching the languages consists in teaching wholly through the medium of the language itself. Though this may seem impossible with beginners it is a practical fact and worthy of the attention of all who teach the modern languages. In order to afford an opportunity to study by this method. Amherst College allows Professor Sauver the free use of its buildings for the Summer session of this school. Last Summer there were 200 students in attendance, representing 21 different States.

SEEDLESS FRUITS. By E. Lewis Sturtevant, M. D., South Framingham, Mass. From the Transactions of the Mass. Hort. Society, part 1, 1880.

The object of this essay—29 pages—seems to be to show that the cultivation of plants tends towards seedlessness. It reminds us much of Mr. Darwin's style of accumulating facts and deducing conclusions therefrom.

Entomological.

THE MELON WORM.

THE Melon Worm (Phakellura hyalinatalis) is about an inch and a quarter in length when mature, of a light yellowish-green color, and nearly translucent. The moth is remarkable for its beauty, its wings being pearly-white bordered with a narrow band of black, its legs and body white and the abdomen terminated with a feather-like tuft tipped with white and black. In the accompanying illustration, Fig. 320, the chrysalis, worm and moth are shown. This worm belongs to the same genus as the Pickle Worm (Phakellura nitidalis), the moth of the latter differing from that of the former in having the ground-work of the wings a bronze-yellow and the black border a little broader.

FIG. 320.

The Melon Worm is proving to be, in many parts of the country, a most destructive enemy to melons, cucumbers, pumpkins and other cucurbitaceous plants. It goes to work in an exceedingly business-like way, making skeletons of the plant leaves or excavating numerous cavities in the fruit when it appears. Sometimes it forces its way into the melon until out of sight, though more frequently it makes a shallow cavity an eighth of an inch or more in depth, and in this pursues its work.

Efficient remedies for this pest are still wanting. Paris-green and London-purple would probably prove effective, but it is not safe to use these on account of their liability to poison those who eat the fruit. Pyrethrum, or Persian Insect Powder, might prove as effective in ridding the plants of the worms, and it has the advantage of being entirely harmless to human beings. Whatever poison is used, it should be applied to both foliage and fruit, inasmuch as the destruction of the former will prevent the latter from coming to maturity. Early planting, so that the fruit may be picked early, or before the most destructive brood appears, is a preventive, and if the worms be destroyed on their first appearance on the foliage before the fruit begins to form, there will be much less danger to the fruit crop.

Fighting Army Worms.

These pests, so destructive to crops, are very hard to destroy. I have tried two plans which, with a little care, can be used with safety to the crops anywhere. The first and best is to dig a ditch six or eight inches deep, taking care that the "straight" side is next to the field to be protected, and, if possible, making it incline a little over the ditch, so that the pests will not be able to climb it. When the worms get into this ditch, which should be the length of the field, or, if necessary, all around it, I turn in my hogs which quickly destroy them, preferring them to the growing crop. The other plan is to throw a ridge of dirt together; this can be easily done with a plow; then with a rake make it as fine as possible. The worms find great difficulty in getting over this if the soil is very finely pulverized. A little care in going over the outer rows of corn and killing the few that may have succeeded in getting up the wall of the ditch or over the ridge, will soon rid the field of the pest. I have tried both plans and prefer—where it is practicable—to dig the ditch as being the safest and surest. N. J. SHEPHERD.

Miller Co., Mo.

A REMEDY FOR THE "STRIPED BUG."—W. L. R. writes us from Upperville, Va., that he has found an excellent plan for ridding his cucumber and melon vines of the striped bug. It is simply the free use of the hoe around the hills and among the vines. As soon as the pests are discovered the earth should be finely pulverized and drawn up close around the vines, the leaves of which should be sprinkled with the fresh fine dirt. A couple of workings in this way will drive off all the little nuisances, and their return can be prevented by frequently stirring up the soil. He has found this plan entirely effective for several years.

Scientific and Useful.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN NO. 62, JUNE 3, 1881.

598. Mapes Complete Manure for heavy soils, manufactured and sold by The Mapes F. & P. G. Co., New York and Hartford, sent by C. E. Bunce, South Manchester, Ct.

601 Superphosphate, made by the Quinnipiac Fertilizer Co., New London.

602. Fish and Potash, made by the Quinnipiac Fertilizer Co.

604. Peruvian Guano, imported by Hobson, Furtado & Co., New York.

Nos. 601, 602 and 604 were taken by the Station from the stock of R. B. Bradley & Co., New Haven.

616. Muriate of Potash, imported and sold by the Mapes F. & P. G. Co., sent by T. N. Bishop, Plainville, Ct.

S. W. JOHNSON, Director.

AN ELECTRIC THEORY OF THE ELABORATION OF SAP IN PLANTS.—W. K. Bridgman argues in the Journal of Horticulture, that it is not any special organization or elaboration of the sap within the leaves, or any downward flow from them, which determines its conversion into the solid fibers and tissues of the plant's structure, but that a process of electro-chemical deposition, like that of the plating of metals, alone explains the mystery. In the case of the plant it is carbon that is rendered soluble by combination with oxygen, and it is deposited when the oxygen is withdrawn just as the metal was. But the metal has a mold which gives it its form; and it is not easy to see what "deflexion of force" guides the liquid sap so exactly everywhere into such endless varieties of form with neither scaffold to build from nor mold to give figure. Yet there is, no doubt, some sort of a connection between the electric formation of the crystal and the structure of the plant. W. L. W.

Literary Miscellany.

THIS FARM FOR SALE(?)

EDGERTON.

"I'm sick and tired o' farming, Jane
Since everything goes wrong,
And if I had a chance to-day
I'd sell out for a song:
We work and toil from day to day,
As hard as we can drive,
But somehow every thing 's a wry
And nothing seems to thrive.

"The chinch bug 's taking all the wheat,
I noticed it this morn,
The oats is struck with rust to-day,
The green-squirrel 's in the corn.
The beetle's in the tater patch
A mowing down the vines—
It does seem Jane, that we are held
By hard and cruel lines.

"Our neighbor's crops are doing well
So far as I can see,
I can't see why this adverse luck
Should fall alone on me;
It must be luck, it can't be else,
Although I've often said
That luck is only what we make it,
Whether good or bad.

"I labor just as faithfully
And do my work as well
As any man in all these parts,
And yet, 'tis strange to tell,
That I alone, of all the rest,
Am singled out to bear
This blight upon the growing crop,
As, witness everywhere.

"I've treated no man yet amiss,
Have kept my conscience free,
And done to others as I'd wish
That they should do to me;
It must be luck, it can't be else,
Or why should all the rest
Have crops as fine, and prospects fair,
As ever man was blessed.

"Yes, Jane, we'll sell the farm
And move ourselves to town,
Since fortune never smiles on us
But only seems to frown;
I'll stick a notice up out here,
'This farm for sale or to let!'
And should it bring a customer
We'll take what we can get."

"Why David, man, how you do talk!
What could you do at town?
Buy property, and then turn round
And have it all burn down;
How would you feel all hemmed in there
And crowded up by men,
With barely ground enough on which
To fix a sitting hen?

You're growling now for elbow-room
On our mile square of land,
While there, the houses stand jammed in
As thick as they can stand;
You'll never want for company,
You'll have it all the while—
Good Lord deliver me from neighbors
Nearer than a mile!

"To town, indeed! that would be fine!
We'd cut a figure there,
With all our stock turned in the streets
And scattered everywhere!
Why surely man, you're going daft,
What can you think about?
Take my advice and go right off
And buy old Tanner out.

"They say he's got too smart to work
And wants to sell his farm—
It's not for me to prophecy
Or wish the old fool harm.
But when men get too awful smart
Their duties to discharge,
It's ten to one they come to naught
And die a county charge.

"As for that song about the crops,
We hear it every year,
We'll raise enough to bread us all,
Of that you need not fear;
And when you want to sell the farm
We'll draw a little line,
You sell your half and go to town
And I'll stay here on mine."

"This farm for sale!" was not put up,
Nor did the crops all fail,
But David bought the Tanner place
Next year at "Sheriff's Sale."
Jane says that when you know you're hurt
It's time enough to cry,
And David thinks that his ill luck
Was *mostly in his eye.*

MARJORIE DAW.

Continued from page 410.

The clock struck ten; the Williams women arose in a bustle; their horse and cart came round, and they drove off in the moonlight.

But a great black cloud was creeping over the heavens; the day had been still and sultry for May; and presently the sudden storm was up. Thunder crashed amid the surrounding mountains; lightning flashed like an army of rebellious angels athwart the heavens, and then the rain fell in a deluge.

"Leave the house-door open, lass," said Mrs. Daw to Marjorie. "I am so afraid of the lightning."

And Marjorie left the door open as she was bid.

Farmer Daw was not afraid of the lightning, and he went to bed.

Aunt Matilda, the mild little woman in flat curls and spectacles, sat by the fire knitting.

"I can't sleep while the storm rages so," said Aunt Matilda. I keep thinking of the chimneys falling, so I'll sit up and get on with this quilt."

"I will sit here with you, aunt," said Marjorie.

The rest of the household were asleep or in their rooms; but Marjorie and aunt Matilda sat before the bright wood-fire. The front door was wide open, and they could hear the rain splashing on the flags outside. There was a large screen pasted

all over with colored prints on a black ground placed between the aunt and niece and the door, to keep out the draught.

"Aunt Matilda, I have something to tell you," said Marjorie. "It is a great secret, and I half promised not to tell, but oh! I can't keep it any longer!"

"Good gracious, my love!" said aunt Matilda, dropping her knitting, "I do hope that you have not promised to marry that poor fellow, the schoolmaster! Oh, your father will be so vexed. He may be good, no doubt, and clever, and all that, but, dear me! book-learning is no good where money is wanted. You ain't a bit fit for a poor man's wife."

Now, just as aunt Matilda uttered this most true and sensible remark, a tall male figure, dripping wet, entered the outer passage through the open door. Rufus Gorse, restless and perturbed, felt his fiery soul akin that night to the stormy elements. Not being able to rest in his little cottage he had come out of it, locked it up, and walked forth boldly into the tempest. Love guided his feet towards the Yarrow Farm. He had expected to find the doors closed and the lights extinguished; but the bright light in the kitchen window induced him to come up to the door, and when he found that open, he walked in. Then he heard the women's voices, and he still walked on, and stood behind the screen a minute.

The storm made such a noise that neither Marjorie nor her aunt heard his steps.

"Rufus Gorse is not good enough to be your husband," said aunt Matilda

"He is so dreadfully poor!" cried Marjorie, bitterly.

Rufus, hearing her words, felt as if she had stabbed him to the heart If he could have seen the tears in her beautiful eyes, he would have read there a story which would have filled him with joy and hope; but he only heard those cold and selfish words—"he is so dreadfully poor!"

"Then you have not promised to marry him?"

"Promised *him*?" echoed Marjorie. "That would be nothing to boast about! No. But what do you think? Mr. Peter has asked me to become his wife."

The girl's voice shook with emotion.

"Think, aunt, I shall wear the family diamonds."

Rufus Gorse felt stunned now, as if somebody had dealt him a murderous blow on the head. To his thinking, the girl's young voice vibrated with a cruel triumph. The screen hid her lovely face, or he might have read another story. He would have seen such a bitter smile on the red lips, tears in the dark eyes; but he only heard the cruel words meant to veil her hearts secret from aunt Matilda—"Promised him! That would be nothing to boast about!"

"Let her wear diamonds, let her become Mrs. Peter but she shall never look upon my face again!"

And he walked out into the storm. Ah! had he but waited another ten minutes!"

"I know that if I marry old Mr. Peter I shall feel like a bird in a gilded cage soon. I shall perhaps hate Beaucourt and the family diamonds. Fancy sitting down day after day with him, and being expected to love him with all my heart! I should go mad!"

"My dear, you would be mad to refuse such an offer. Love in a cottage, Marjorie, often means the workhouse in the end—that is, if there is a long family and sickness. That young Gorse only gets sixty guineas a year."

"I think I should like a workhouse better with him than a palace with Mr. Peter."

"You don't know what you are talking about, my dear," said aunt Matilda.

Meanwhile, Rufus Gorse was walking over the mountain road. He did not even re-enter his house to take away his clothes.

"She shall think me dead!" he said, bitterly, to his raging heart

The next day the strange, weird tale spread all through the district. Mr. Rufus Gorse, the school master had returned to the little cottage, where he lodged with a good couple, who let him a tiny sitting-room and bedroom. At about nine o'clock he had eaten some bread and cheese drunk a glass of claret, and gone whistling gaily up to his room; the storm came on, they heard him go out, and he had never returned He had left behind him his clothes, his books, his gold watch—a gift from his fellow students at the training college—his desk with a few shillings in it, the musical score of a sketch for an opera—in short, all his belongings. He must have fallen into the river where it was deep, near the village said public-opinion, and so have been drowned and carried out to sea.

When they told Marjorie this, she sank fainting on the floor. Mr. Peter came to see her when he heard she was ill, and found her lying on the sofa in the parlor, pale, and with the shadow of a great dread in her eyes; he asked her, in the presence of her parents, to become his wife.

She turned her face away and moaned.

Mr. Peter knelt by her side.

"My dear," he said, "forget it all; you will be happier up at Beaucourt."

"I think I should," she said, sadly: "it might help me to forget, and it would please my father; but, Mr. Peter, I can never love you as I loved dead Rufus, only I never knew that I did love him until I lost him for ever and ever!"

And a few weeks after, without any pomp or ceremony, Marjorie became Mrs. Peter, for she was married in the village church.

* * * * * * *

Time rolled on, Summer followed Spring, Autumn followed Summer; Winter came white and hoar and ice-crowned. The mountains stood wrapped in white. Marjorie had married the odd old man, whose estates north and south brought him in five thousand a year. She was indeed like a wild bird pining in a golden cage.

Mr Peter was a jealous husband and a terrible miser, considering his vast wealth and high position. He only took his bride once to London and then they sojourned at a third-rate hotel.

She had hard work to induce him to buy her a new dress once a year. He did not allow her to visit; he gave no parties. She had enough to eat and drink, and fires to warm her in the cold weather; and in the Summer she enjoyed the flowers and fruits in the gardens of Beaucourt for old Mr. Peter grudged nothing to his flower beds and his fruit trees; also there was a fine library, and there were pictures, and china and statues and bronzes enough at Beaucourt to satisfy a prince; but Marjorie's heart was heavy, her life was dull, she pined for the society of the young.

Mr. Peter was a tyrant; he did not allow her to go near her humble parents. She read, and she played on one or other of the fine pianos that stood in the fine old rooms. She sang, but her heart was empty and hungry for love. Her husband treated her like a willful child.

One golden afternoon in September she was pacing listlessly up and down a path bordered with laurels, when she saw a servant man approaching her with a white, scared face. He was the bearer of awful tidings. Mr. Peter had been thrown from his horse, and was taken up dead! Some days of bustle and confusion followed.

She took advantage of her freedom, and sent for her parents at once. Then came the distant cousin, and afterwards there was the funeral, and then the will was read;

"All the lands and the country seat of Beaucourt to Marjorie, my dear wife; but she shall forfeit every shilling if she marries again. The whole shall then revert at once and forever to my cousin Henric Peter and his heirs forever."

Beautiful Marjorie smiled sweetly.

"I don't wish to marry again, she said."

In due time, when a decent period allotted to mourning had expired, Marjorie went up to town, opened and refurnished the grand family mansion that had been closed for years, and sailed away on the high seas of pleasure. This had once been her dream. She was in the very glory of her beauty and she quickly became the rage.

"But she must never marry, or she will become a beggar!" whispered the gossips.

"See-saw, Marjorie Daw,"

She was driving in the country; she felt thirsty, and sent her footman into the inn of the village to ask for a glass of water. Then she saw the village children playing see-saw on a broad plank balanced over a great trunk of a tree in a builder's yard.

"'See-saw Marjorie Daw,
Sold her bed and lay upon straw.'"

sang the little ones in chorus. Up and down, up and down, went the tiny, rosy girl with curly hair and ragged white bonnet, and laughing face.

"See-saw," said Marjorie to herself. "Yes, mine has been that kind of life ever since that night when Mr. Peter and Rufus both asked my hand in marriage."

At that moment a gentleman—yes, a gentleman—walked out of the Hens and Chickens, and came towards Mrs. Peter, carrying a glass of water, clear as crystal.

Marjorie's large eyes dilated. Was this a ghost! or was it Rufus Gorse, changed, yet the same, after four years—handsomer, sterner, with more thought and more power on his brow than of yore?

She was white as death; she stood up; she tried to speak.

Rufus came to her and placed her again amid her soft cushions.

"Drink this," he said tenderly.

In his eyes were lights bright and strange; his heart stirred wildly; his love for Marjorie was still part of himself.

She drank the water, then she pointed to a place by her side.

"Come with me," she said, sweetly, "and we will drive on farther, and you shall tell me all."

* * * * * * *

They have been driving for hours, and the shadows of twilight are creeping over the land when their horses' heads are turned towards London; and more, Rufus has told Marjorie of the mad despair that filled him when he heard her speak slightly of his poverty, and of the offer made her by Mr. Peter.

She has told him that if he had waited five minutes more he would have heard her confess that she loved him.

Rufus says that he wished her to think him dead. He had a few pounds in his pocket; he went to Germany and studied music; he got on well, won honors, became in two years musical professor at a German college at a fair salary. Then he wrote an opera, an opera of which the world had talked for the last year; it was called "Donato," and it had already filled his pockets with money; it was, commercially, as valuable to him still as a landed estate. He was rich. A year ago he went home suddenly to his parents, who had believed him dead, and who, amid their poverty, their numerous children and their numerous cares had almost forgotten him. He gave them some hundreds of pounds, and then his mother showed him a letter which had been sent on to her as having been addressed to her son after his supposed death.

Rufus drew the little soiled letter from his breast-pocket and kissed it passionately.

"If I had not had that I never would have come near you," said he.

"Ah," Marjorie cried, "that very night of the storm I wrote you a little letter in my own room by the dim light of a small lamp. I can repeat it now.

"'DEAR RUFUS: I find that life without you would mean emptiness and hunger of the heart all my days. Yes, I will wait for you ten years, or share an attic with you as soon as you choose to call me wife. MARJORIE DAW.'"

"Oh, Marjorie, if I had only waited! When I had that letter you were a widow; but I said to myself she is now a fashionable woman of the world—her love has changed. Still I determined to throw myself in your way, to hear you speak, to look in your face once more."

Marjorie was silent, then she said:

"And do you love me as well as that night when you stood by the gate in the lane?"

"More, for now I know that your heart was noble always."

"But if I marry you I become a beggar."

"But I, in my way, am rich, and the world of music is at my feet."

Three months afterwards the worldly-wise were wondering, with all their minds and souls, at the folly of which Marjorie had been guilty in not allowing the dead hand of old Mr. Peter still to crush the happiness out of her life. She had lost Beaucourt and five thousand a year; but her husband makes nearly that sum every year. She is a happy wife and mother.

Marjorie, when we heard of her last, was as happily placed as any one can well be in this see-saw world, where ups and downs, good and evil, balance each other so evenly, and yet it seems to us so capriciously.—The end.

NORTHWESTERN IOWA.

REPRESENTATIVES OF THE RURAL IN PALO ALTO CO.

MESSRS. HOLMES AND SWEETLAND.

"Westward the course of empire takes its way,
The four first acts already past;
The fifth shall close the drama with the day,
Time's noblest offspring is the last."
BISHOP BERKELEY.

Why Eastern farmers can better their condition in the West may not have been heretofore lucidly and tersely placed before them. We will mention a few of the most important reasons and then notice the peculiar advantages of this county for those who desire to purchase and manage farms and draw from their dormant wealth the reward assured to honest toil.

The native soil is conceded by agriculturists to be superior to many portions of the East, large crops being the general result even of the first season's work. Pasturage is almost unlimited and the finest in the world, costing little, the grass growing in abundance of the succulent varieties necessary for rapid growth and even fattening of stock. The same amount of money invested in the West will procure from three to eight times as much land as it would in the East. Every acre purchased will yield from 20 to 50 per cent. more than its Eastern prototype with the same care. Railway facilities are ample and education and religion are as well represented (except on the frontier) as in the East. Hence many who can are seeking these advantages, and the questions asked us are "Where shall we go?" "How shall we get there?" and "What are the most lucrative branches of agriculture in localities named?" The West presents every requisite in the aggregate for diversified husbandry, and even many counties combine the entire range of desirable features.

Such is Palo Alto County, situated on the 43rd north parallel of latitude and 94 deg. 30 min. longitude; the fourth east of Dakota Territory and second south of Minnesota. It is gently undulating prairie, with deep, dark, fertile soil, adapted to the cultivation of cereals and peculiarly to stock raising and dairy products, and in this direction lies much of the present prosperity and future wealth of the country. The rich grazing, abundance of pure water, and salubrious and invigorating climate promote the growth and maturity of stock, and secure for Palo Alto beef the highest market quotations in Chicago. We were told that from one farm there were shipped in one week 172 head of three-year-old steers, averaging in weight 1,800 pounds, some weighing as high as 2,200 pounds. This affords a valuable hint of the best way to clear 200 per cent. or over upon corn that yields from 60 to 80 bushels per acre upon land worth from $10 to $20 per acre, improved. The same land unimproved can now be purchased at from $5 to $10. From Hon. E. J. Hartshorn (State Senator from this district and agent at Emmetsburg for the lands belonging to the C. M. & St. P. Ry.), we learn that the railroad company are not only selling their lands cheap and upon easy terms, but allowing a rebate upon all breaking done the first year nearly equal to the cost of the same. A valuable auxiliary to the rapid and substantial development of this country is the

Scottish American Land Co.,

incorporated under the laws of Iowa and Great Britain, with a capital of $500,000, selling lands to actual settlers only on favorable terms, at an average of $6 per acre, advancing money to aid in building at six per cent. interest—equal to half or three-fourths of the cost of improvements. Every purchaser of 160 acres is furnished with 10 head of two and three-year-old heifers and a thoroughbred Durham bull, for four years, after which time the original stock and one-half the increase are to be returned as the only compensation to the company. They are also renting farms when desired, either for "cash rent" or "on shares." Alex. Peddle, Esq., the attorney, and Land Commissioner of the company, their only representative in America, located at Emmetsburg, told us that if parties desired he would furnish the land, pay them $2 per acre cash for breaking, provide the necessary flax seed for sowing to secure a crop the same year, would pay half the thrashing bill, and divide the crop with the tenant. Upon these terms we have personally known of instances where the profits of one year would actually purchase the farm. The company own large bodies of land in this and adjoining counties

Palo Alto is crossed by the Des Moines River, and, besides numerous small streams, has six handsome lakes abounding in fish of the varieties usual in fresh water, to which the State Fish Commissioners have added salmon and lake trout. There are many handsome artificial groves and some growth of natural timber along the banks of the streams. There are over sixty public schools in the county under good tuition, while the religious and social privileges make one feel as much at home here as in older and more populous localities.

As a route of travel to reach this county from the East the most direct and the one requiring the fewest and most convenient changes, would be via. the Pennsylvania R. R. to Pittsburgh, the P., Ft. W. and C. R'y to Chicago and the C., M. and St. P. R'y without change to Emmetsburg, the county seat, a pleasantly situated town of about 1,000 inhabitants, almost in the center of the county, crowning a sightly elevation and affording a fine view of the surrounding country. It is platted around the south end of Medium Lake (which is five miles long and about three-fourths of a mile wide) which, by the way, could be beautified at a very small expense and made a popular resort. It is now a favorite starting point for sportsmen who desire to visit the beautiful lakes of the vicinity. They can leave their heavy baggage at the Grand Central or either of the two other hotels and make a tour of the best hunting grounds of the Northwest. A fine new court-house has been erected during the past year at a cost of $18,000. and from it may be seen a vista of beautiful farming lands. There are four churches; a good graded school, well attended, well disciplined and well taught; a goodly number of business houses of the various branches; ample facilities for handling grain, and a large trade. Two efficient local papers are published here and various benevolent societies organized. One of the most enterprising railroads of Iowa, the Burlington, Cedar Rapids and Northern will extend their line from their present terminus, Clarion, to this place this season—a valuable competitive advantage for Palo Alto County. Not only is this little city a mart for grain but also for cattle, hogs and sheep—a natural consequence of the grazing privileges.

The Silver Lake Creamery was established here in 1879 by Messrs. Hovey and Ammon. It has a capacity for making 1,000 to 2,000 pounds of butter a day, and is built on strictly scientific principles. It has also every facility for making cheese. The work here is done on the cream-gathering plan using the Davis and Fairlamb Creamery can, of which it is said that "none better are made." H. & A. are keeping about 30 cows. These gentlemen are quite old, and inform us that it is their intention to dispose of the entire interest if a good reliable purchaser is found.

If this creamery interest which is so important to farmers, was supplemented by a steam mill, a flax fiber factory, or wagon manufactory it would add materially to the wealth of the county. For information and assistance extended us by Alex. Peddle, Esq., Hon. E. J. Hartshorn and Messrs. Ormsby Bros. (bankers and dealers in real estate), we hereby tender grateful acknowledgments and any of the gentlemen will answer any inquiries regarding the county.

A short ride of fourteen miles west brought us to the village of Ruthven, a brisk little town of 150 population having a good school. There are several business interests but need is felt for a good wagon maker, harness-maker and physician. Elbow Lake two miles long by one-quarter mile wide is north of the town. Lots here range from $10 to $50, and the elements of prosperity present themselves for the future rapid growth of the place. Any inquiries addressed to C. W. Hastings (a dealer in general merchandise here), or A Ruthven, we are told will be promptly answered.

BOOKS RECEIVED.

First German Book. By JAMES H. WORMAN, A. M., New York; A. S. Barnes & Co.

This book in primer form is designed to instruct persons in the spoken language of Germany. It is not a grammar consequently does not pretend to any but a limited exposition of rules although sufficient knowledge is imparted to make it of much practical use. The illustrations greatly increase its value.

Advanced Readings and Recitations. By A. B. FLETCHER. Boston: Lee & Shepard.

This book of selections meets a demand which is constantly increasing. The compiler has aimed to present only such pieces as will be of value to seekers of elocutionary improvement. Popularity unless balanced by merit has been avoided. Introductory rules instructively blended with exercise form one of the commendable features.

Rosecroft. By WM. F. ROUND. Boston: Lee & Shepard. Price $1.

Amusement and suggestions for serious thought are combined qualities of this book. New characters and ideas are brought out which distinguish it from similar novels. The scene is laid in New England, and a genuine Yankee man figures extensively, disseminating much good in his quaint way.

Aim, Fire-Bug-Stories. By JULIA M. BERCHER. Boston: Lee & Shepard.

This is one of the many entertaining books written for juvenile minds. Its naturalness is one of its chief recommendations, as children are better pleased with what may be readily understood. Good, wholesome reading, not trash, is given.

A FAMOUS lawyer, having been so for more than a quarter of a century, was accosted by a man, who said: "I have a boy whom I want you to take and make a lawyer of." "How old is he?" said Mr. —. "He's 18 years old, stout and rugged; he's got a pair of lungs like a bellows," replied the father. "Has he any other qualifications?" "Yes, sir, he's got the one great qualification of all," said the father; "he's the confoundest liar in our town. I thought when I heard you in the court-room just now that it wouldn't take very long for Sam to come pretty nigh up to you."

"DOCTOR," said a lady patient, "I suffer a great deal with my eyes." The old gentleman adjusted his spectacles, and with a Socratic air replied, "I do not doubt it, my friend; but then you ought not to forget you would suffer a great deal more without them."

For Women.

CONDUCTED BY MISS RAY CLARK.

APPLE BLOSSOMS.

Apple blossoms! apple blossoms!
Dainty sweet, and dainty fair.
What on earth to me so lovely?
What on earth to me so rare?

In the Springtime, in the Springtime,
In the childhood of the year;
When the birds come back to forests
Now no longer dark and drear.

Then the modest little violet,
And the snow-drop pure and white,
Ope their eyes and hail the Spring-time
Smiling in its happy light.

Then I hail ye, apple-blossoms,
Then I watch ye bud and bloom;
And I give you gladdest welcome
As I breathe your sweet perfume.

For a happy recollection
Comes to me of long ago—
Of words spoken in the Spring-time,
Of words spoken sweet and low.

And to me they are far sweeter,
Better, dearer every way;
For I sat beneath their branches
On that glad and happy day.

Branches bending loving o'er me,
Waving gently in the air,
Ringing sweet congratulations,
Crowning me with blossoms fair.

Do you wonder that I love them!
That to me they still are dear?
That I call them my "good angels?"
Sweetest blossoms of the year?

Apple blossoms! apple blossoms!
Dainty pink, and dainty white,
Blessings shower down upon me,
Strew my path with flowers bright.

In the Spring-time, in the Spring-time,
Come ye back to me each year,
Bringing with your fairy presence
Mem'ries bright old age to cheer.

CONCERNING CORRESPONDENT'S QUESTIONS.

MARY WAGER-FISHER.

"Improvement," asked in Rural of April 8, what is necessary in order to possess a well cultivated voice, and what books are to be read for mental cultivation to a mind not well stored. I think that any voice can be greatly improved without the aid of elocutionary training, by diligently and persistently toning it down to what are called "chest tones." Most Americans speak in head tones and nasal tones at that. A well modulated voice with distinct enunciation, is almost invariably, an agreeable one to listen to, and these qualities can be acquired by any one who has the earnest wish to do so. A young lady who was visiting me a few months ago whose voice and conversation were extremely charming, said one day after I had alluded to the quality of her voice: "I am glad you think so; but my mother is constantly saying to me, 'Bertha, you *must* key your voice to a lower pitch,' and I'm all the time trying to get my voice *down, down*." My teacher says the great thing to do in order to acquire richness, fullness and roundness of tone, is to constantly try to get the voice *down*; to make it deep and round in tone." This girl never spoke in a voice of high pitch, and yet everything she said was of perfect distinctness. From early childhood she had been trained by her mother to speak and to talk, beautifully—to express herself in the best and simplest words the English language affords, and always to appreciate the fact that her voice in conversation should be as finely and sweetly attuned, as in singing.

I think all parents who think at all, realize the immense power of habit—of early training. It is almost as difficult to convert a vulgarly bred young person into an elegant man or woman, as it would be to change the spots of the leopard's skin. Repeatedly, have I seen men and women who have risen to social eminence by the force of character and talent, and who have "taken on" much of the polish of society, betray at times in their manner, and in their conversation, their choice and pronunciation of words, their low bred origin. They were perfectly conscious of these defects, but found themselves utterly unable to root out of their being the vulgarities that had been implanted in them in childhood, and which had taken such deep hold. Of course, all sensible people respect and admire such persons none the less for their misfortunes; but they themselves suffer keenly from it, and bear the sense of its humiliation to the end of life. I have often heard young people who have been well educated in schools, exclaim, "What would I not give, if I had only been accustomed to hearing the English language well spoken in my childhood!" for no amount of grammatical study will ever atone for illiterate habits of speech formed in youth.

Fathers and mothers may think it silly and foolish and "hi-fa-lu-tin," may be, to talk in the best English they can, it may be so to themselves, but if they have children they have no moral right to talk or to behave in but the very best way they know. It matters little whether they have money to leave their children, but it *does* matter *much* that they accustom them to exercise good manners, so that to be well mannered will be to them an every day garment, Burke said "Manners are of more importance than Law," and many of lesser importance than the great English statesman, have recognized the fact that a fine manner is more than money, beauty or apparel. There is something hideous in a pretty girl who is ill mannered, while there is a great charm about a plain girl who is sweet, gentle and polite in her demeanor. Truth, sincerity, gentleness, unselfishness and love for others lie at the bottom of all true politeness.

While on this topic, I am reminded of the criticisms my comments on the way many people eat, have called forth. "A Farmer" asks "what is a saucer for?" and yet he probably knows as well as anybody that it is to set the cup in—a very necessary use, too. I never think it worth while to find fault with the ways of very old people, and if such find comfort in drinking tea from a saucer and putting food in the mouth with a knife (providing they don't cut themselves) it would be absurd to criticise their habit or try to change it. But when younger men and women can form better and more modern habits, why should they not? And should not the children have the benefit of the best examples? In no place does young or old person's manners receive such signal illustrations, as, at the table, and I have seen persons at finely served tables sit in mortal fear because they felt that they didn't know how to behave.

As to books, I would recommend to "Improvement" the following, as a few that I myself have found to be of special value in the line she suggests. Motley's Rise of the Dutch Republic; Plutarch's Lives; Vicar of Wakefield; Emerson's Essays; Higginson's Young Folk's History of the United States; Arnold's "Light of Asia;" Hawthorn's and George Eliot's Novels; Schiller's Plays; Secky's Intellectual and Moral Histories of Europe; Biographies, especially of eminent Americans, as Marshall's Life of Washington, and The Life of Farragut by his son. The American Book Exchange—often advertised in the Rural—furnishes some excellent works at a trifling cost. Macauly's Life of Frederick the Great; Carlyle's Life of Robert Burns, Lamartine's Life of Mary Queen of Scotts, cost each, but *three* cents, post paid, while The Light of Asia (the finest poem of the century, to my mind,) the Vicar of Wakefield, and Baron Munchausen cost but *five* cents each. Bunyan's Pilgrim's Progress costs but six cents These works alone, if *thoroughly* read and re-read until one knows them "by heart" will give to any mind a cultivation of no mean sort, and the entire cost of them all is *thirty* cents! What a wonderful age we live in! As for a study, there's nothing equal to Botany for making one *see* what there is in the world—in the works of the Creator.

To all persons interested in silk worm culture And things pertaining thereto, you will get more information than I can give you in two columns of this paper, by writing for circulars to the president of the Silk Culture Association. Mrs. Lucas, 1328 Chestnut Street, Philadelphia, Pa., send with your application a postage stamp. The circulars which contain all you want to know, probably, in regard to the matter of silk culture are gratuitous, and the Association is a purely benevolent one. The women at the head of it are very patriotic, earnest and intelligent, and fully charged with the belief that in the cultivation of silk, lies a great and profitable industry to the women of the United States.

HINTS.

Use of Lemons.—For all people, in sickness or in health, lemonade is a safe drink. It corrects biliousness. It is a specific against worms and skin complaints. The pippins, crushed, may also be mixed with water and sugar, and used as a drink. Lemon juice is the best anti-scorbutic remedy known. It not only cures the disease, but prevents it. Sailors make a daily use of it for this purpose. A physician suggests rubbing the gums with it daily to keep them in health. The hands and nails are also kept clean, white, soft and supple by the daily use of lemon instead of soap. It also prevents chilblains. Lemon is used in intermittent fevers mixed with strong, hot black tea or coffee without sugar. Neuralgia may be cured by rubbing the affected part with a lemon. It is valuable also, to cure warts, and to destroy dandruff on the head, by rubbing the roots of the hair with it.

Ammonia.—Ammonia will remove finger marks from paint, where there would otherwise have to be a good deal of scrubbing with soap, which takes the paint off too. Ammonia is useful to wash all the brushes that are used in a household. Nothing will cleanse greasy sinks, pans or scrubbing brushes so well. A teaspoonful in a basin of warm water will make hair brushes beautifully white. Take care not to let the backs of the brushes dip below the surface; rinse them with clear warm water and put them in a sunny window to dry. A small bottle of ammonia is also useful for the wardrobe. Keep a little sponge with it, and, when woolen dresses are stained or soiled, they are easily cleaned by passing a little diluted ammonia over the spots. Fold a towel and place it under the spotted or soiled portion while you are cleaning the dress.

Hanging Pictures.—The majority of people hang pictures too high on the wall. Whatever the hight of a room, the pictures in it should be hung on a level with the eye of an adult when standing, an adult of average hight. Pictures are hung upon the wall, supposably to be seen with both ease and pleasure; but when they are perched up nearly to the ceiling they can be viewed neither with the one feeling or the other. When you have occasion to buy picture cord, buy instead, wire, for hanging frames. Cord wears out, becomes moth-eaten, and some day down comes your pictures with a crash. Hang your pictures so as to be nearly, if not quite, flat against the wall. People who understand the art of hanging pictures well, no longer hang them so that the top leans out from the wall.

Bureaus, &c.—It may not have occurred to some housekeepers that bureaus and other pieces of heavy furniture having drawers in them near the floor may have the dust thoroughly removed from under them by taking out the drawers and using a wisp broom to remove the dust. This is a great deal easier than moving the entire piece of furniture, which, with women who are not strong, is often impossible.

ABOUT WOMEN.

Lucia Zarate, the smallest woman in the world, was born in Mexico.

Mrs Garfield sits up easily for about two hours at a time, and is rapidly convalescing.

Mrs. Strohm of Gosper county, Nebraska planted over 2,600 fruit and forest trees on Arbor day.

Zare Thalberg, the daughter of the pianist, is to retire from the stage, and marry an Italian marquis.

Miss. M. M. Gillette, has been appointed by President Garfield a notary public for the district of Columbia.

Mrs. Nellie Grant-Sartoris will probably spend a part of this Summer with her parents at Long Branch.

Margaret Fuller's birthday was celebrated in Chicago on June 13th with music and recitations of prose and poetry by the "Margaret Fuller Society." She was seventy-one.

Miss Louisa M. Alcott has written an introduction for Roberts Brothers' new edition of Theodore Parker's "Prayers," in which she gives reminiscences of the famous writer.

Mrs. Harriet Lane-Johnson, niece of President Buchanan, is now at Wheatlands nursing the only child left to her—a bright boy of eleven, of whose return to health there is little hope. Mrs. Johnson's eldest son died last Winter.

Miss Marianne North, who has just arrived in New York, has been traveling alone all over the world for the last ten or fifteen years, painting trees and flowers, with a bit of landscape to show their habitat. She has climbed wild mountains, been driven through savage places in camel-wagons guarded by natives, and has floated down strange rivers upon inflated skins. She has made more than six hundred studies of trees and plants, some of them unknown to botanists before, and has presented them to the Kew Gardens, where she has built a gallery for them.—Woman's Journal.

A Father's Advice to a Bride.—Said a young husband, whose business speculations were unsuccessful, "My wife's silver tea set, the bridal gift of a rich uncle, doomed me to financial ruin. It involved a hundred unexpected expenses, which in trying to meet have made the bankrupt that I am." His is the experience of many others, who. tess wise, do not know what is the goblin of the house, working its destruction. A sagacious father of great wealth exceedingly mortified his daughter by ordering it to be printed on her wedding cards, "No presents except those adapted to an income of £200." Said he, "you must not expect to begin life in the style I am able by many years to indulge, and I know of nothing which will tempt you to try more than the well-intentioned but pernicious gifts of rich friends. Such advice is timely. If other parents would follow the same plan many young men would be spared years of incessant toil and anxiety; they would not find themselves on the downward road because their wives had worn all their salary or expended it on the appointments of the house. The fate of the poor man who found a linch-pin and felt obliged to make a carriage to fit it is the fate of the husband who finds his bride in possession of gold and silver valuables and no large income to support the owner's gold and silver style.

CORRESPONDENT'S CORNER.

Miss Margaret B. Harvey wishes to add to her list of flowers requested in 18th issue: Fumaria officinalis (Fumitory); a leaf of Aplectrum hyemale (putty root); Oxalis violacea (Violet sorrel).

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

MRS. O'FLANY'S MARBLE CAKE.

MARGUERITE.

A young mother living near us was lying low with consumption. I prepared for her a pitcher of iced lemonade, and wrapping an additional piece of ice in flannel, took them to her. She wanted drinks almost continually, and she thanked me again and again, saying, "it tastes so good!" The thought of the additional ice to use later comforted her, for she had been looking forward with dread to the evening thirst.

I started home, and as I was passing Mrs. O'Flany's door I concluded to "step in." She was standing by the table, with eggs, sugar and flour upon it.

"Och, heaven bless you! You are just the lady I'm wantin' to see," she exclaimed. "I'm glad I stopped thee," I said. "I went over to the store mesilf and bought some baking powder, and they inclosed the directions for baking with it; so I thought to mesilf that I would make a *marble* cake for the fayther to carry for his dinner." "That will be nice," I said, knowing the poor man seldom got a bite for his dinner in that line. "Which part shall I help you to prepare, the light or dark part?" I asked.

She looked at me, and as she did not reply I repeated the question. "Why, one cake is in the oven, ma'am," she answered. I opened the oven door and looked in. There, sure enough, was the light part, nearly baked and looking good enough to eat. "But, Mrs. O'Flany," I asked, "how are you going to get a marble cake out of it?" She looked more mystified than before, and finally exclaimed, "Och, now, sure have I gone and done it wrong afther all!"

I told her the reason it was called "marble" was because a spoonful of the light and dark dough were put in alternately to imitate the stone after which it was named; but her cakes were not spoiled, as she now had two instead of one.

She laughed heartily over her blunder, and I joined her; but still I felt sorry she had not been more successful, for it was a real task, as well as an expense, for her to bake cake. First, she had to meet the milkman quite a distance, as he could not drive near the house, then away to the store for butter and eggs, with a child, perhaps, in her arms, or to go running alone, scarcely knowing what might befall them ere her return, as the cars passed her door almost continually.

"I would not have tried only I wanted something extra for the fayther," this day," she said, half regretfully.

"It will be very good as it is, Mrs. O'Flany," I said; "but I will write you off a recipe for sponge cake which you will not need to have milk or butter for at all." So I wrote as follows:—Four eggs, one cup of sugar, one of flour, and two teaspoonfuls of baking powder. Beat the yelks and sugar together; whip the whites stiff, and sift the flour and sugar together. Stir in first a spoonful of flour and then one of the beaten whites until mixed. Bake in a moderately hot oven.

"Heaven bless you! I'll pray for you when I use it," she exclaimed, as she thanked me for my kindness.

COOKING SMALL NEW POTATOES.

Select the *very smallest*, scrape and drop into cold water. Have ready a sauce-pan of hot lard or drippings. Drain the potatoes, dry them on a towel and drop into the hot fat. Cook until easily pierced with a fork. The fat should not be too hot or the potatoes will be too deeply browned before cooked through. Drain, sprinkle with pepper and salt and serve at once.

Another good way of using the smallest potatoes is to scrape and boil them until almost tender and then to put them into a frying-pan having a few spoonfuls of hot drippings or butter. Sprinkle with pepper and salt and cook until nicely browned. Only enough fat is required to keep them from burning. Or, boil until tender, drain, and cover with a white sauce made of a pint of new milk, a large spoonful of butter, pepper and salt and thickened with a spoonful of flour, rubbed smooth in a little milk. This quantity of sauce answers for a quart of potatoes. The sauce should be first made, the potatoes added, and then leave on the back of the range 10 minutes before serving. Simply boiled, drained and dried with a few spoonfuls of melted butter poured over them, they will be found very palatable and altogether too good to throw away; as is often the case from a lack of patience in preparing. B. K. L.

HINTS.

A little powdered borax and tallow are as good as anything to add to starch to prevent its sticking.

Sweet spirits of nitre is recommended for ivy poisoning.

When a mustard plaster is not wanted to blister, mix the mustard with the white of an egg.

A thin coat of white varnish applied to a worn straw matting makes it look better as well as adds to its durability.

Kerosene is excellent for cleaning unvarnished furniture, either walnut or oak.

DOMESTIC RECIPES.

Cherry Fritters.

Make a batter of a pint of milk, four beaten eggs, a pinch of salt, two even teaspoonfuls of baking-powder and enough flour to make a little stiffer than pan-cake batter. Beat thoroughly, then stir in a pint of stoned cherries and drop by the spoonful into hot fat. As you take from the fat, drain on an old but clean napkin, dust with powdered sugar and serve with liquid sauce.

To Cook Turnips.

Pare and slice and boil in as little water as possible. When almost done and almost dry, add an even tablespoonful of sugar to each quart of turnips, and salt to make palatable. When dry and tender mash, add two or three spoonfuls of thick sweet cream, and serve hot. Very nice. Cook.

Pie Crust Shortened with Beans.

Boil white beans until soft, rub through a sieve, and mix as much into flour as can be done and preserve sufficient tenacity in the dough. Add a little salt. This crust is used at "Water Cures" and makes a far better pie crust than one would, suppose who had never eaten it.

Blackberry Mush.

Two quarts of ripe berries, a quart of boiling water, two cups of white sugar and a little salt. Boil slowly five minutes, then thicken with Graham flour and cook a few minutes longer. Put into a greased mold to cool. Serve with cream.

Mrs. D. J.

Apples and Rice.

Boil a cup of rice in three pints of milk until tender. If you have no custard kettle, put the rice in a tin pail, cover and place in a kettle of boiling water. Pare and core with apple corer eight harvest apples, put into a buttered baking dish and fill the cavities with sugar. Put the rice around the apples but do not cover the tops. Bake half an hour, cover with the beaten whites of three eggs, sift over a little sugar and brown in oven To be eaten with sweetened cream or milk.

Mrs. J G.

That low, nervous fever, want of steep and weakness calls for Hop Bitters.—*Adv.*

News of the Week.

HOME NEWS.

On the 21st ult, Mr. Conkling made a speech at the Delevan House in a conference of stalwarts. He opposed any combination with the object of electing a stalwart and half-breed. He thinks the stalwarts should stand by their colors until Dec. 31 if necessary. His speech was over an hour long. But the sensation of the week was the withdrawal of Senator Jacobs' name from the candidacy for U. S Senator. Mr. Fowler in withdrawing Jacob's name said it had been stated that a quorum voting for other candidates might give to one candidate a majority of their votes in which case the votes for Jacobs (dem) would be ignored, and on these grounds he withdrew Jacobs' name. This caused much excitement and the Jacobites voted somewhat at random. Wm. A. Wheeler's vote jumped from 40 to 50. The democrats made Clarkson N. Potter their caucus candidate. The voting during the week has changed but little, excepting the transfer of the democrats' votes from Jacobs to Potter. The report has been circulated that Depew's name will be withdrawn and Frank Hiscock's substituted but it is probably untrue. Dr. Mary Walker is out with an address to the legislature asking to be made its choice for Senator. Anything for variety!

ANOTHER appropriation of $500,000 has been made for the Capitol at Albany. The cost of the building was originally limited to $4,000,000, but nearly $13,000,000 have already been expended and good judges say that $7,000,000 more will be required to finish it. The people won't mind the money if the building don't fall down before the workmen leave it!

That bribery investigating committee has closed its labors and no definite conclusion as to who is the guilty party has been reached. It has proved a very interesting "side-show" to the larger "circus" going on in the Capitol.

Mr. Brady, of Star-route fame, has arisen in wrath and demanded an investigation, by the Grand Jury, of the evidence against him. Knowing that the Grand Jury of the District of Columbia cannot sit beyond July 5th, and that every moment of the time intervening will be occupied he is anxious for vindication. Wait till the proper time, then B-rady!

Thomas Garfield, an uncle of the President, was killed by the cars near Cleveland, Ohio, on the 22d inst. A Mrs. Arnold who was with him had her skull fractured but will probably recover.

The American Association for the Advancement of Science will meet at Cincinnati, August 17, and will continue in session several days.

The Regents of the University of Michigan are considering the feasibility of establishing a school of political science in connection with that institution, the design being to give instruction in political economy, international law, constitutional law, and the history of political institutions, the general Constitution and history of the United States and England, the history and principles of finance, and sanitary law.

A check for $14,949,052 20 was recently given by the Pennsylvania Railroad Company to a committee representing 2,700 shareholders of the Philadelphia, Wilmington and Baltimore road, who reside mainly in New England. Nearly $2,000,000 more will be disbursed among stockholders in Philadelphia. The Wilmington road passed into the hands of the Pennsylvania on July 1.

John G. Saxe, the poet, in consequence of his troubles by death in his family, and a railroad accident six years ago, has become a victim of melancholy. He will remove from Brooklyn to Albany, where he will live hereafter.

Three colored men have taken $1,100 worth of stock in a new cotton factory being organized at Augusta, Ga. A colored man, a slave up to the end of the rebellion, is, with two or three exceptions, the largest cotton planter in Mississippi. The assessors' returns show that the colored people are increasing their ownership of property with most satisfactory progress in all the Southern States.

And now the Canadians are dropping down from the uncongenial North into the more fertile lap of the United States. Last month about 11,000 of them came to stay, and more are getting ready to come.

The colored Republicans of North Carolina complain to the President that they are not given offices enough. But this is not new. This complaint is chronic among all classes all over the country.

The reduction of interest on the Government bonds has been so successfully conducted that Secretary Windom thinks it will not be necessary to ask Congress for any legislation on the subject when it assembles in December.

Alexander Swift, brother-in-law of the Cary sisters, Alice and Phœbe, has bought the old Leary homestead, near Cincinnati known as Clovernook, and intends to repair the building and to make of the grounds a memorial park in honor of the departed and venerated early occupants of the place.

J. H. Wade has given the city of Cleveland a tract of land valued at $500,000 which has been converted into a park. It will be known as Wade Park.

Hamilton Desson, a prominent manufacturer of Philadelphia, has bought 4,000,000 acres of land from the state of Florida. This is said to be the largest purchase ever made by a single person in the world. The tract of land is nearly as large as the state of New Jersey. The price paid is unknown. Mr. Desson intends to settle a large number of immigrants on the land.

Dr. Joseph Cummings of the Wesleyan University Middletown, Conn., was recently elected President of the Northwestern University, Evanston, Ill.

Rev. Howard Crosby D. D. has resigned the Presidency of the University of New York.

Attorney General Johnston of Kansas decides that the drinking of wine in church communion is not a violation of the new liquor law, but that adruggist or other person selling wine for the purpose would be liable to penalty.

Mr. John K. Buchtel, of Akron, O., was given $75,000 more to the Buchtel College, of Akron, making his gift nearly $200,000.

George S. Merrill, recently elected Commander-in-Chief of the Grand Army of the Rupublic, says the headquarters will be established at Boston. Comrade William M. Oliver is appointed Adjutant General.

The boy evangelist, Rev. Thomas Harrison, after 11 weeks of earnest labor at Indianapolis, is credited with 2,200 conversions. Sixteen churches of that city are now open for revival work, and the use of the theaters for Sunday services has been tendered.

More than one-tenth of the inhabitants of the United States live in ten cities—New York, Philadelphia, Brooklyn, Chicago, Boston, St. Louis, Baltimore, San Francisco, New Orleans and Cleveland. Nine States have one-half of the population of the country, and less than one-fourth of the United States Senators.

Whittaker's friends are determined not to let his case rest with the adverse finding of the military court, if such it shall be. They claim that the evidence taken does not justify a verdict of guilty, and they propose to make argument to this effect before the Judge Advocate General. Then, if the Judge Advocate General approves the finding of the court, Whittaker's friends intend to go before the President and ask him to disapprove it. They make no point on the color question, and will not. In spite of their efforts it is likely the finding of the court will be approved.

Brockton, Mass., now manufactures more sewing-machine needles than all Europe combined. They are turned out by the million and shipped all over the world. The needle made of the best of steel, passes through thirty different hands in its manufacture before leaving the factory; it is of various sizes and shapes, curved, straight, two-eyed (twin holes,) and the cheapest costs three-quarters of a cent.

Advices from Fort Smith indicate that affairs in the Chickasaw and Choctaw Nations have reached a crisis. The United States cavalry at Fort Sill were ordered to report for duty to United States Agent Tuffts at Muskakee on June 24, to cooperate with the Choctaw militia, under Gov. McCurtain, in removing white intruders and their stock from the Nation.

The personal effects of the late Vice-President Henry Wilson, including his library, correspondence with prominent men, and household goods, are soon to be sold at auction, at Natick, Mass. Mrs. Howe, Mr. Wilson's wife's mother, who is now 94 years old, will continue to live at the old homestead, and the estate will probably be rented to some person who will care for her.

According to Secretary Blaine, there are more than 1,000,000 applications for office on file in the various departments at Washington.

Griscom, the Chicago faster, has now been without food for 30 days and is looking bright and cheerful. He walked 12 miles on Thursday and Friday which is pretty good for a man who takes no food.

Mr. Justice Matthews, of the U. S. Supreme Court, has accepted the invitation of the New York State Bar Association to deliver the annual address before that body at their next meeting in New York.

Among other bequests in the will of the late Eli Bates of Chicago, is one of $40,000 for the erection of a monument to President Lincoln at the entrance to Lincoln Park, in Chicago, and $25,000 donated to the Industrial School.

One of the great sights to be seen at Pierre, Dakota, on the Fourth will be the great Indian grass dance, which will be participated in by a large party of Sioux Indians. After the dance a feast in the way of a whole roasted ox will be given them.

The Natural Bridge tract in Virginia has recently been purchased as a part of a general scheme, which is not yet fully developed, but which contemplates the laying of an extensive park and possibly the establishment of forestry.

It is said that eight more mills are to be built at Fall River, Mass., this year.

A Physician's Report.

Many physicians are using Compound Oxygen in their practice, and with remarkable success. One of them writes: "My patient has now been under treatment about four weeks. His condition at the *time of beginning the Treatment was very unfavorable indeed*; he was very feeble, severe cough, expectorating pus in considerable quantity; he suffered with night sweats; all of his friends considered his case as hopeless. *Every symptom has improved; his cough is very much better; his strength and general appearance has improved a hundred per cent.: in fact he has the appearance of a new man.*" Our Treatise on Compound Oxygen containing large reports of cases and full information, *sent free*. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

FOREIGN NEWS.

Across the Atlantic, Ireland is still disturbed by the Land League agitation. Hundreds of the prominent leaders of the movement have been imprisoned under the Coercion Act, but others promptly take the place of those arrested. It is said that each person imprisoned costs the League three pounds, or fifteen dollars, a week for board, as the League supports all its "persecuted" members, being unwilling that they should have to suffer from the ordinary prison fare. Ten dollars a week are also, it is said, doled out to the families of poor prisoners. Arrests have been unusually numerous of late in order, it is supposed, to bankrupt the League by forcing it to support a large number of prisoners. Parnell and some other leaders are coming to this country, however, to raise funds for carrying on the work. In England the land bill is still before Parliament with no immediate prospect of its passage even by the House of Commons; should it pass this ordeal, however, it is very likely to be rejected by the House of Lords, in which case Parliament will probably be dissolved and an appeal be made to the country by a new election.

On the continent the chief matter of interest just now is the condition of hostile public sentiment between France and Italy, growing out of the Tunisian "affair." After a few unimportant skirmishes between the French and the wild mountain tribes in Tunis, one division of the French army approached close to the city of Tunis whereupon the Bey submitted and the country was virtually annexed to the French African dependencies. This greatly exasperated the Italians who had a covetous eye on the place for themselves, and on the return of some of the French troops to Marseilles the other day a quarrel took place between the populace and a lot of resident Italians, in which several persons were killed and a good many others wounded more or less severely. In the city there are always a great many Italians chiefly workingmen, and the popular agitation at once turned against these. A great many of them left right away, returning home; several factories in which others worked were burned down, causing a loss of about 6,000,000 francs or $1,000,000. So soon as the news reached Italy counter demonstrations took place at Milan, Rome, Naples and other large cities, and the popular excitement demanded war with France. The authorities, however, saw the necessity of promptly suppressing such dangerous manifestations and things are "cooling down" a little. There is still a world of "bad blood" on both sides of the Alps, however, and could Italy feel sure of help, if hard pressed, she would probably go to war with her powerful neighbor.

[Milwaukee Evening Wisconsin.]

The spirit of mortal may not be very proud, but we notice it waxes overly profane in some cases where rheumatism is the moving cause. We use St. Jacobs Oil for ours and are happy.—*Adv.*

AGRICULTURAL NEWS.

The following is an itemized account of the expenses of the Department of Agriculture for the fiscal year just closing.

General salary account	$89,200
Contingent expenses	10,000
Collecting agricultural statistics	10,000
Purchase and distribution of valuable seeds	80,000
Experimental garden	7,600
Museum and herbarium	1,000
Furniture, cases and repairs	5,000
Library	1,000
Laboratory	4,000
Investigating history of insects	5,000
Investigating diseases of swine	10,000
Experiment in sugar	7,500
Data respecting arid region	5,000
Examination of wools, etc	4,000
Reclamation of arid lands	20,000
Report on forestry	5,000
Postage	4,000
Total	$248,300

The importation of American lard is prohibited in Hungary. American pork and bacon have been proscribed for some time.....It is proposed to hold an agricultural and mineralogical exhibition at Madrid, Spain, in 1882.....A statement was published at Winnipeg, Manitoba, last Wednesday, by authority of the traffic manager of the Canadian Pacific Railway, which gives an account of the crops at the different stations on the line of the road. It shows a very large area of grain sown, amounting to nearly double that of last year. The crops are said to be growing splendidly, and an abundant yield of cereals and other products is predicted. The pasturage from frequent showers is good, and the live stock are in an excellent condition. The outlook for dairy products is encouraging and highly satisfactory.....Mr. Beecher has petitioned to have the suit brought against him by the Agricultural and Mechanical Society of Western Maryland removed from the Superior Court of Baltimore City to the United States Circuit Court.

Census Agricultural Statistics.

Tables showing the area and product of cereals of the United States and Territories.

The Illinois Legislature has passed a law for the appointment of a competent veterinarian, to be known as the State Veterinarian or Veterinary Inspector, whose services are to be paid for out of the State Treasury. He is authorized to order the slaughter of diseased animals, which are to be appraised, and are to be paid for by the State. The Governor is empowered to order the quarantine of infected localities, and prohibit the importation of live stock from certain localities, unless the same come provided with certificates of health from the Veterinary Inspector. Heavy fines and imprisonment are imposed upon any person in the State who shall not report pleuro-pneumonia among their cattle, or shall in any way hinder said Veterinary Inspector in the discharge of his duties.....Mr. Vennor has now begun "predicting" for July, and under date of June 17 writes:—"I regret to have to warn you of a hot and stormy July, with frequent disastrous storms of wind, hail and rain throughout those sections in which the June storms have been so severely felt. The month will resemble that of 1880 rather than 1879."".....A Hail Protective Association has been formed at Greeley, Colorado. It is on the mutual plan.....An attempt is being made to a number of fine healthy birds to a friend who is set-introduce English pheasants among the Rocky Mountains, and Lord Morley has lately despatched tled in that region. It is now suggested that American turkeys could be introduced into England.....The prairie bird might also be acclimatized there with advantage.....The threatened extermination of the famous Alpine flower, Edelweiss, has led the authorities of various Swiss cantons to prohibit the exportation of the plant and to allow the gathering of the full-blown flower only.

The Executive Committee of Delaware State Grange recently caused an analysis of a commercial fertilizer to be made, and finding it to fall short of phosphoric acid (available), gave notice to the sellers of large quantities of it to Patrons, that they should make up the deficiency in fertilizers, and an equal amount additional, or that the Grange, being an incorporated body, would bring suit to secure damages. The demand was complied with, putting the equivalent of a good round sum in the pockets of Patrons.....The first car-load of new wheat reached Chicago on June 22, and was graded "rejected Winter.".....A wealthy Californian named Brennan has received a government grant of 84 leagues of excellent land in Sonora, from the Mexican government on condition that within five years he will have a colony of 500 families on it. Until the terms are complied with the title to one-half the grant will be withheld. The colonists will be allowed to import all goods for their own use free of duty.....

Owing to the severe competition between transportation by rail and by water *via* the lakes and the Erie Canal, freight rates from Chicago to this city are being cut down to an unusually low point. It is reported that contracts have been made to transport thousands of car-loads of grain from Chicago to this city for 12 cents per bushel, the "pool" rate being 17 cents. Contracts have also, it is said, been made for the transportation of large quantities of meat at 20c per 100 pounds.

All over the West, but just now especially in Iowa, a strong agitation is under way against the barbed-wire fence monopoly created by a late decision in a patent case. Farmers are everywhere combining, or talking of doing so, against the high prices charged by the monopolists. The Grange, too, is taking a hand in the fight, and the validity of the patent must soon once more come up for judicial decision..... Preparations for the great cotton exhibition at Atlanta, Ga., are being vigorously pushed, and applications for space are rapidly pouring in from intending exhibitors all over the country.

"Mother has Recovered,"

says an Illinois girl to her Eastern relatives. "She took bitters for a long time but without any good. So when she heard of the virtues of Kidney-Wort she got a box and it has completely cured her Liver complaint."—Health and Home.

Speaking of the merits of Gates' Garget Cure, one of our exchanges says: "Every cattle owner and dealer will appreciate hearing of a sure cure for that troublesome and much prevailing disease of the udder called garget: and such a cure Mr. John B. Gates of Worcester, Mass., claims his preparation, "Gates's Garget Cure," to be. As every man is liable to blow his own trumpet too well, and considering how the country is overloaded with all kinds of would-be cures, Mr. Gates forbears to ask for the public's confidence on the strength of his own assurance, and therefore refers simply to the many recommendations at hand, whose authorship cannot be questioned, most of the names being well known throughout Worcester county. The latest testimony received is from Mr. James F. Leach, the proprietor of the celebrated Swiss herd. On account of the letter's length, we cannot repeat it here, but its gist is a statement as to the infallible effect of the "Garget Cure," advising every farmer to keep it constantly on hand. Of the many names to whom Mr. Gates is permitted to refer are the following: D. G. Aldrich, Worcester, Mass.; J. C. Ray, Sup. of State Farm School, Manchester, N. H.; John O. Fox, Putnam, Conn.; J. Patch Stockwell, Sutton, Mass.; Thos. H. Sakell, Berkley, Mass.; John G. Oxer, Campbellstown, Ohio. The "Garget Cure" is kept by first-class medicine dealers."

Women that have been given up by their dearest friends as beyond help, have been permanently cured by the use of Lydia E. Pinkham's Vegetable Compound. It is a positive cure for all female complaints. Send to Mrs. Lydia E. Pinkham 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

When life is a drug, and you have lost all hope, then trust in Hop Bitters.

BURNETT'S COCOAINE,

The Best of all Hair Dressings.

It allays irritation, removes all tendency to dandruff, and invigorates the action to the capillaries in the highest degree, thus promoting a vigorous and healthy growth of the hair. Its effect upon the glossiness and richness of the hair is such as cannot be surpassed.

Burnett's Flavoring Extracts are the best.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, June 25.

Chicago.—WHEAT unsettled; No. 2 Red Winter $1.15@1.18; No. 2 Chicago Spring $1.13@1.13¼, cash $1.13¾@1.13⅞ July; $1.14¼ August; $1.11¾ September; No. 3 do., $1.02@1.07. Corn in fair demand but lower and very weak at 46¼c. cash; 45¾c. July; 46c. August; 46½c. September; rejected 42¼c. OATS unsettled at 38⅛c. cash; 37¼c. July; 28½@28¾c. August; 27¼c. September; rejected 31@31½c. PORK firm at $16.25 cash; $16.20 June and July; $16.30 August; $16.37½ bid, September. Lard steady and firm at $11 cash and bid, July; $11 August; $10.87½. September. Bulk-meats irregular; shoulders $5.95; short rib $8.45; short clear $8.85. FREIGHTS—Corn to Buffalo higher at 3¼c.; wheat do. 3½@3¾c. BUTTER steady; fair to fancy creamery 18@21c.; good to fine dairy 14@17c. CHEESE easier; full creams 8¾@9c. EGGS lower at 14c. Timothy seed firm at $2@2.45; flax seed $1.23, clover seed firm at $3.80@4.25. HOGS—Demand fair and 5@10c. lower; mixed packing $5.50@4.85; light $5.65@5 90; choice heavy $5.90@6.15; culls and light Yorkers $5@5.50. Cattle active and strong; export nominal at $6@6.30; good to choice shipping $5.60@6; poor to fair $5@5.50; all sold; market closing strong; butchers' active at $1.87½@4.75; through grass Texans $3.35; stockers and feeders $3,20@4.90; good clearing. Sheep—market fairly active and steady; common to good $3.05@5.

St. Louis.—WHEAT dull No. 2 Red Fall. $1 18@1 18¾. cash; $1 16¾@1 16¾ July; $1 14¾ August; $1 14¾@1 15 September; $1 13⅞@1 14¼ all the year; No 3 do., $1 12¼@1 13, an advance; No. 4 do. $1 06¾. Corn dull at 45½c.@45¾c. cash; 45¾c@45¾c. June; 45¾c.@45⅞c. July; 45⅝c., August; 46c.@46¼c., September; 41¾c.@41¾c., all the year. Oats dull 35¾c. bid. cash; 34c@34¼c. July. Hogs steady; Yorkers, $5 80@5 90; packing, $5 75@5 95; choice to fancy $6@6 15. Cattle—very light supply was quickly taken at strong previous prices; light to heavy shipping Steers, $4 80@5.80; grass Texans, $3 25@4 25. Sheep stock scarce and only moderate demand at $3@4 25.

Cincinnati.—WHEAT steady; No. 2 red Winter $22; receipts 4,400 bush.; shipments 3,300 bush. CORN unsettled; No. 2 mixed 43c.; No. 2 white 50¾c. OATS quiet; No 2 mixed 40c. RYE in fair demand; No. 2, $1; August, 80c. BARLEY scarce; extra No. 3 Fall, $1.08. PORK quiet at $16.25@16 50. Lard quiet at $10 80. Bulk-meats steady; shoulders, 6½c.; clear rib, $8.55. Bacon firm and unchanged. Hogs active and firm; common and light, $4.40@6 10; packing and butchers', $5 50@6.30.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, June 25, 1881.

ALCOHOL—Quoted 3⁷½c. for export.

BEANS AND PEAS.—Beans are selling only in a moderate way and prices are barely sustained. A fall is expected at this season. Green peas nominal at $1,50@1,55 for Wisconsin. Southern B. E. $3.25 ₱ 2-bush. bag.

Marrow beans, prime, $2.45@2.50; other, $2.30@2.40; medium, prime, $2.40@2.45; other, $2.20@2.35; pea, $2.25@2.50 white kidney, $2.30@2.40; red kidney, prime, $1.55@1.60; fair to good, $1.40@1.50; black or turtle soup, $1.40@1.45.

Receipts for week, 6 356 bush.

Exports do. 913 pkgs.

BEESWAX—Demand light; small lots quoted 23@23½c.; shipping parcels 23@25c.

BUTTER.—The market is firm, its surroundings considered. Prices are resting mainly upon a speculative foundation, and if this should soften under heavy offerings—and there is a good deal of high grade being held—there is a possibility of a lower scale for actual business. It may be as well to mention that some of the leading dealers who usually go in on wise speculative chances are not securing a package above their current wants. Shippers are operating, but not in a voluntary way. A number of fine State marks have obtained a reputation abroad during the previous cheap and heavy crops, and a few orders are cabled. The storage of creamery has been quite liberal, and the belief that Summer packing will be heavy enough to give held stock a place has a good line of votaries. Deliveries from the West will have much to do with the realization of that and the "increased population" theory. The week exhibits a good business, the early efforts of exporters having kept down an immediate surplus.

Creamery—Western, good to prime, 21@22c.; State and Penn. 21½@23c.; poor, 19½@20c.; sweet cream, 20@22c.; State pails and h'f tubs, choice, 21c.; fair to prime, 18@20c.; Welsh tubs, 19@21c.; poor State, 14@18c., firkins yellow, 20@22c; Western imitation creamery, 18@20c.; dairy, 18@19c.; other, 14@17c.; factory or ladle-packed, best, 15@16½c.; other, 10@15c.; very poor Western, 10@11c.

Receipts for week, 43,700 pkgs.

Exports for week, 12,836 do.

CHEESE.—The market has exhibited remarkable vitality in holding up to 10c. in the face of the large supply of the week. On Thursday over 61,000 boxes arrived but tone of trade did not perceptibly waver. The fact that we are short of last year's export to date has been a good leverage for sellers. Supplies have been well cleared up from station and store, and the outlook is for some recovery for next week. Western cheese is not running high in quality. Home trade using best Ohio.

State factory, fine, 9¾@10c., fair to prime, 8½@9¾c; poor to fair, 8@8¾c., Ohios, flat, fine 8¾@9c; other 7½@8¼c: part skimmed, 4¾@6c.; full skims, 2@3c.; Wisconsin poor to fine 7½@9½c.

Receipts for week, 136,117 boxes.

Exports for week, 132,000 boxes.

Liverpool cable, 54s.

Steam to Liverpool, 20@25s.

COTTON.—Stocks seem to be under better control, and the demand for consumption, here and abroad, has imparted a tone of more regular steadiness to positive or spot sales.

The close at the market for futures was officially reported as follows: June, 11.01@11.02c.; July, 10.99@11c.; August, 11.03@11.04c.; September, 10.63@10.64c.; October, 10.22@10.23c.; November, 10.09@10.10c.; December, 10.10c.; January, 10, 22@10.23c.; February, 10.30@10.35c.; March, 10.46@10.48c.

DRIED FRUITS.—A steady trade has held evaporated apples where they were and full prices are expected for the rest of the finer marks. Sun-dried apples quiet A few have been taken for France. Concessions have been offered German shippers without leading to trade. Peaches quiet, but firmly held under short drop reports and no heavy supply here. Sundried peeled are quoted at 19@18c. Small fruits not a feature at this season.

Apples evaporated choice 8¾@9c; fair to prime 7¾@8¾c. North Carolina sliced, common to best 4¾@5c. Va, do. 4@4½c; Tenn. in bbls. 4c. do. bags 3¾@4c; State fine cut 3¾@4c., quarters 4¼c Western. 3¾@4¾c; evaporated peaches peeled 27@30c.; unpeeled 13@14c; sun-dried peeled 17@22c; unpeeled halves 5@5½c. Plums 12@12½c. Blackberries 8c. Cherries 12@14c. Raspberries 23@24c. Whortleberries 11¼c.

Receipts for the week, all kinds, 412 pkgs.

Exports dried apples, 2,426 pkgs.

EGGS.—Receipts for week, 11,329 bbls.; do. last week 12,088 do. Early in the week a break in prices was threatened, but with moderate receipts prices have held quite steady. For general use Canadian eggs sell best. Few near points now reach the market.

L. I. & N. J, 18½@19c.; State and Pa., 18c.; Canadian, 17@17½c.; Western, Md. and W. Va. 17c; off quality, 16@16½c.

FLOUR.—A buoyant market has followed unfavorable impressions of the wheat crop and a large business is reported at better prices.

No. 2, ₱ bbl., $3.10@3 80. State and Western superfine, $4.15@4.75; city mills extra, $6.25@6.50; Spring wheat do. $4.85@5.25. Spring XX and XXX, $5.35@7.00; patents, $6.25@8; Minnesota bag and hoop shipping, $5.10@5.35; trade brands, $5.50@6.50; St. Louis extra, $5.10@5.60; do. double extra, $5.75@6 25; do. family, $6.40@7; Southern shipping, $5.40@6; do. XX and family, $6.25@7.50. Rye, $5.40@5.80. Corn-meal, Brandywine, $3.25@3.40; Western, $2.75@3.25.

Receipts of flour for week, 102,150 bbls.

Exports of flour, 64 450 bbls.

FRESH FRUITS.—Quite a variety of fruits now embellish the market. Strawberries begin to moderate in supply, but there has been a long surfeit of them and buyers will not pay very high prices. About the best berries now come from Oswego. The Chas. Downing has become very popular as a market berry and it will be likely to rule where the Wilson used to.

Oswego quarts, 9@11c.; other Western, 7@8c.; up-river Downing, 8@12c.; Wilson, 6@7c.; Connecticut, 10@12c; a few N. J. range at 6@8c. Norfolk apples, $1@2 ₱ bbl.; whortleberries, $2@2.50 ₱ ¾ bush; raspberries 7@8c. ₱ ¾ qt.; black caps 8@10c ₱ qt., gooseberries, English, $4 ₱ bush.; common, $1., currants 4@6c, ₱ lb. Cherries have had a bad season; no attractive parcels now arrive; they range from 3 to 4c. ₱ lb. Peaches scarce; nominal rates, N. C., $2 50@3.50 ₱ bush; S. C., $2@2.50; Ga., $2.50@3 ₱ ½ bush. prime; hot-house, $2 50@3.50 ₱ doz The Delaware crop is an acknowledged failure. Watermelons dull at $35@45 ₱ 100 for Fla. A few Cal. Summer pears and apricots are offered at $5 ₱ box. Black Hamburg grapes $1@1.50 ₱ lb. Peanuts active and higher; Va. hand-picked, 5¼@5c. ₱ lb.; fancy, 4¾@4¾c.; extra prime, 4½@4¾c.; good to prime, 3¾@4c.; shelled, 3¾@3c.; pecans, 7@10c.

GRAIN.—Wheat has advanced, and at the improved prices trading has been very liberal for export, both Spring and Winter grades receiving attention. Speculators have been encouraged by the strong backbone of regular sales; but the market is up to a point that for a time at least will limit "paper" transactions. Corn has partaken of the strong movement in grain on 'change, and is quoted at the close as higher and active and not lacking in speculative interest. Oats have declined, not an unusual event in Summer trade; a good business is noted at the easy figures. New Southern wheat, Va., begins to arrive at Baltimore: 100 bags of Texas have come to New York.

Wheat, Spring $1.12@1.27; do, No. 2, $1.24@1.26; do. No. 3, $1.16@1.17; red Winter No. 2, $1.29½@1.30¾; red Winter $1.15@1.31; white Western and State $1.18@1.30. Rye, $1.05@1.09. Oats, white No. 1, 43c.; white No. 2, 43½@44c.; white No. 3 43c; mixed No. 1, 44c; do, No. 2 41¾c; do. No. 3 43@43c.; Corn, Western mixed 59@59½c.; do. No. 2 57¾@59c.; do. do. yellow 58@61c; Southern do. 57@60c.; do. white 61c.

Receipts for week, wheat, bush., 994 800; corn, do. 1,345,300; oats do. 812,200; rye, do. 3,647; malt, do. 63,700; rice pkgs. 831.

Exports for week, wheat, bush 1,057,850; corn, do. 1,006,000; oats, do. 8,708; rice, pkgs., 96.

HAY AND STRAW.—Exports for week 2,249 bales. The market for hay continues weak with very liberal supplies. Under grades are again lower. The new prices have induced considerable exportation. Clover not wanted. Straw tending downwards.

Choice retailing timothy hay 85@90c. ₱ 100 lbs.; second quality, 70@75c. do.; shipping 50@55c.do.; Long rye straw 85@90c. ₱ 100 lbs.; short do. 50@60c.; do. other grain, 45@50c. do.

HOPS.—Buyers are few and they act cautiously. Choice hops are hardly quotable, being nearly out of stock at the moment. Low grade hops are easier to sell.

Crop of '80 choice, 20@22c; good to prime 16@19c; fair to good, 13@16c; poor to fair, 11@13c; Eastern, 11@18c.; '79's, fair to prime, 12@15c.; '78's, 5@8c.

Receipts for week, 733 bales.

Exports for week, 155 bales.

MILK.—The season thus far has been a slow one for the use of milk in quantities. Farmers seem to have become disgusted with the low rates of the past few weeks and have diminished shipments. There is plenty for all present wants and the market for commission milk has ruled slow at an average of 3½c. per can of 40 quarts; it has seldom exceeded $1.

OIL CAKE.—Firm at $29.50@30 for Western.

POULTRY AND GAME.—Prolonged cold weather has helped the sale of turkeys. Chickens chiefly sell at the under rates. Fowls in good demand and firm, following stronger rates in live. Ducks quiet. Squab, in the absence of a game supply, are in good demand.

Dressed turkeys, choice ₱ lb 14@16c.; coarse 13@14c; scalded, 12@13c.; Phila. Spring chickens 22@27c; New Jersey, 20@24c; fowls, Phila. d.-p. 16@17c.; N. J. d.p. 15@16c.; do. scalded 14@15c. State and Western 14@15c; do. d.-p. 15@15½c.; coarse 12@13c.; Ducks, Spring, 18@20c.; old 12@14c.; Squabs, white, ₱ doz. $2.75, do. dark, $1.75@2

Prime live fowls and nice four-pound chickens have sold well; small chicks hard to sell Turkeys have a good call for Summer. Ducks and geese not running very extra in quality.

Spring chickens prime ₱ lb 22@23c.; other 18@21c. Fowls, ₱ lb. 13@14c; roosters, 7@8c.; turkeys, 11@12c.; ducks, ₱ pair 60@75.; geese, extra $1.50; other 75c@$1.37. pigeons, 25@30c

A good supply of wild pigeons has been obtained for the shooting match at Coney Island. They have sold readily at $2@1.12 ₱ doz. Egg, snipe, $2.25@2.50. Plover, $2@2.25.

PROVISIONS.—Home speculation gives the market for hog products some energy, but it is not responded to by a wholesome export demand.

Pork, extra prime, $14.25@14.50 ₱ bbl.; Western mess, new, $17.00; old $16.50@16 75; Lard—Western steam, $11.25 per 100 lbs.; prime city, $11.00 Hams—smoked city, 11½@12c.; pickled Western, 10¾@11c.; shoulders, smoked city, 8@8¼c; pickled, 7¾c. Bacon, long clear, 8¾@8¾c. Beef, Western mess, ₱ bbl. $10@13; India tes, $23@24; beef hams $23@23.50

Receipts for week, beef, bbls. and tcs, 660, pork,, bbls. 900; cut-meats, pkgs, 15,000; lard; do. 16,350.

Exports for week, beef, bbls. and tcs., 1,900; pork do. 3,350; cut-meats, lbs. 5,332,062; lard, do. 3 675,900.

SUGAR.—The following list shows the latest rates for refined.

Hard sugars—crushed ₱ lb 10¾c; do. powdered 10¾@10¾c, do granulated 10¾c; do. cut loaf 10¾@10¾c; confectioners' "A" 9¾c; coffee "A" standard 9¾c, do. off "A" 9¾@9¾c, white extra "C" 9@9¼c; extra "C" 8¾@8¾c; "C" 8@8¾c; yellow 7¾@7¾c,

TOBACCO.—Continental and other European contracts are well filled and with a good domestic call last prices are fully maintained.

VEGETABLES.—New potatoes are abundant and very cheap. Bermuda down to $3@3.50. All Southern $2@2.50 for prime and 75c@$1.50 for culls to fair. Old potatoes dull and weak; bulk prices $1.25@2 per bbl. for double heads and 2sc. Long Island peas plenty. A good demand prevails for prime green stuff. Southern items begin to be neglected.

Green peas, L. I., ₱ bag, 75c; wax beans, Norfolk, ₱ crate, 30@50c.; string beans do. 30@50c. Tomatoes Bermuda per 5 qt. box 20@40c; Southern per crate 50@$1; cabbages, L. I., ₱ 100, $3@4 do. Norfolk 75c.@$1; beets, L. I. ₱ 100 bchs., $1.50@2; carrots, do., $.@1.50; turnips do., $2@2.50; rhubarb do, 75c.@$1; radishes do., 50@75c; asparagus, Oyster Bay ₱ doz., $.75@2; other $1@1.75; lettuce ₱ bbl., 30@40c.; onions, Bermuda ₱ crate, 40c.@$1; Md. ₱ bbl. $3; cauliflower, ₱ doz., 50c@1.50.

WOOL.—There is considerable competition for the new clip and trade is brisk at all points with a strong upward market.

Ohio, Penn. and W. Va. XXX and picklock, 43@45c.; X to XX, 40@42c.; No. 2 to No. 1, 40@45c. coarse, 34@38c.; combing 40@45.

State and Western X and XX, 38@40c.; No. 2 to No. 1 38@41c.; coarse 32@36c.; combing, 40@41c., combing unwashed 28@32c.

Va., W. Va. and Md. unwashed medium 27@30c.; Ga. and Lake unwashed medium 27@30c.; coarse 23@26c. burry and slightly burry 16@22c; Cal, Spring northern, free, 30@34c.; middle counties, free, 27@30c.; southern, 23@27c.; low grade and burry, 18@23c.; Fall, choice, 24@25c.; low grade and burry 16@20c. Texas choice, free, 28@32c.; fair to good, 24@26c.; low grade and burry 17@20c. Pulled super 38@42c.; extra 35@38c; No. 1, 20@23c; combing, 35@40c.; lambs, 38@40c. Tub washed, fair to choice, 35@44c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, June 25, 1881.

BEEVES.—Receipts for the week 12,905 head; do. last week 13,512 do. The comparatively free arrivals sold well and prices were in sellers' favor. Some of the better grades of steers showed an advance of $1 per head, and medium stock, as the supply thinned out, were fully ¼c. higher than similar grades on Wednesday. Colorado stillers sold at 10¾@11¾c.; native stillers, 9¾c., to dress 55 lbs., and 11c. to dress 86 lbs.; medium to fair corn steers, 10@11c.; dr. 56c.; good to choice, 11¾@12c., to dress 56@57 lbs. Fat bulls 4½@5c., live weight.

VEAL CALVES.—Good weather has favored a market demand, and prices have ruled steady. A few extra fat calves have made 8c.

Prime N. J. fed, 7¾c; do, state, 7@7¼c.; poor to good yard lots, 5¾@6¾c.; Mt. Hollys, 7@7¾c.; buttermilk, 4¾@4¾c.; up-river, dressed, 10@11¾c. Our quotations include West Washington market stock.

SHEEP AND LAMBS.—Receipts for the week 32,948 head; do. last week 34,824 do. A steady but not active market is reported; good sheep selling rather quicker than lambs. Sheep quoted $4.25@5 40 ₱ 100 lbs. Lambs—Southern and Western, 5¾@6¾c.; a few N. J., 9c.

MILCH COWS.—Arrivals are fair but contain few desirable animals; in fact $45 is the highest figure noted for the style of stock here. Common have a nominal range of $25@35. There is no special demand and shipments of prime are not invited.

SWINE.—Receipts for the week 25,371 head do. last week, 26,773 There is a firm feeling in live hogs following the advance on 'change for city dressed. Live corn hogs quoted $6@6.20 per 100 lbs; none left over. City dressed State, 7¾@8¾c.; do. Western 8c.

I have used Higgin's English Salt and consider it superior to Ashton's. I ordered Higgin's Salt but the Ashton's was sent me and I returned the Ashton's. O. M. RICHARDS.

AN OFFER
TO—
CONSUMERS
—OF—
TEA & COFFEE.

We have made a specialty during the past four years of GIVING AWAY as PREMIUMS, to those who get up CLUBS for our Teas, DINNER SETS, GOLD BAND TEA SETS, SILVER-PLATED WARE, and other articles both useful and ornamental.

We import and buy direct from manufacturers all the goods we handle, and own them at the *lowest possible price* cash will purchase. During the past four years we have sent from our store over **12,000** of these orders, and they have gone into almost every State in the Union.

We keep in stock *every variety* of Tea known, and at all prices.

Oolong, Japan, Mixed, English Breakfast, Old and Young Hyson, Imperial, **50c., 75c.**, very finest **$1.** Gunpowder, Black Japan, Foochow **75c., $1.** Orange Pekoe and Assam, **85c** and **$1.**

Below are a *few* of the many Premiums offered:

With a **$5** order we send a *Silver-Plated Caster.*

With a **$10** order we send an *English China Tea Set of 45 pieces.*

With a **$15** order we send a *Silver-Plated Caster, Pickle Dish and Butter Dish* or an *English China Decorated Tea Set of 44 pieces.*

With a **$20** order we send a *French China Gold Band Tea Set of 44 pieces*, or an *English China Dinner Set of 106 pieces.*

We have *hundreds* of letters like the following:

LIME ROCK, CONN., April 20th, 1881.

Gentlemen—Please accept thanks for the beautiful Tea Set, which is much nicer than I expected, and indeed it is surprising to every one how you can do so much for so little. All are so well satisfied with the Tea that I think you will receive another order soon.

Yours truly, MRS. A. THORPE.

TAUNTON, Mass., March 8, 1881.

Gentlemen—I have forwarded eight different orders for Tea, and have received as premiums a tea set, a silver-plated caster, a dinner set, a glass set, a case of silver-plated knives and forks, a pair of French china fruit dishes, and *two ladies' gold watches*, and am now on my ninth order. Both Tea and premiums I am well pleased with, and have found perfect satisfaction with both. Yours truly,

MRS. MARIA C. LYNCH.

Orders, with P. O. Order, or money enclosed in registered letter can be sent at our risk. All checks or Post Office orders should be made payable to F. M. LINNELL.

We also send Teas by mail, without premium, postage paid, at list prices, to those who wish for choice goods and are so situated they cannot obtain them at home. For full price and premium list, send us postal, with address PLAINLY WRITTEN.

Reading for the Young.

FARMING FOR BOYS AND GIRLS—NO. 26.

HENRY STEWART.

Cattle Food.

When in a state of nature, animals lived in plenty on grass in the Summer time and half-starved on dry herbage or small branches of trees in the Winter. By such feeding they were able to rear their young and maintain their existence. But in keeping cattle for profit more than this mere increase in number is required. The farmer must make more from his cattle, sheep and pigs than this, or he cannot live. He must not only rear his young stock, but the mature animals must be quickly brought to as great a weight and as fine a condition as possible, so that they can be sold for much more than the mere value of the food. It is very clear that this can only be done by the use of food richer than grass or hay alone, and the food must be given in as large a quantity as the animals can digest and assimilate. Every ounce of food less than this causes the animal to be all the longer in reaching a profitable condition for sale, and all beyond it is waste. It is then necessary to learn how much food our animals require and to supply this to them with the greatest regularity.

But foods differ in quality and value. We may give a cow or an ox dry straw in great abundance and the beast will become poorer instead of making flesh or gaining fat. If in place of straw we give good hay, the animal will thrive better, but will not get fat very fast, if at all. It will simply keep in fair order. If we feed some bran it will do better; if some corn-meal is given it will do better still, and if corn is given until the animal can eat no more it will fatten very fast. It is the same with a cow that is giving milk; with poor feed the milk is poor and there is little of it, but by giving richer food and plenty of it, the milk is greatly increased and is made much richer in cream and butter. But while some foods have a greater effect in this way than others, it is necessary to consider their cost and market value; because there are times when a farmer may sell hay at a good price and feed straw with bran and corn-meal, or oil-cake meal, at a much less cost, and thus save money.

This is a part of the business of farming; for a farmer must be a good business man to succeed as well as he may. It is a mistake to think that one must leave the farm and go into a town or city, and work in a store, to learn business. As much may be done on a farm in this way as in a store and as profitably, if the farmer knows how to make the best of his advantages. And there is a great scope for a young man or a young woman to become expert in business in farm work. The rearing and feeding of cows and beeves, pigs and poultry, the production of milk, and the making of butter and cheese, are all business operations that pay all the better the more skillfully they are managed. A boy may have a few sheep and for want of feeding them well in the Winter he may find the wool is very light and poor and the lambs are very weak in the Spring, and the increase of the flock may not be enough to pay for the hay the sheep have eaten. A girl may have a flock of hens and for want of the right kind of food, there may be no eggs in the Winter when eggs are high in price; and no early chickens, which are worth twice as much as late ones. While in either case the fat lambs that sell in the market for six, eight or ten dollars in May, and the fresh eggs which sell for forty or fifty cents a dozen in the Winter, are sold by those persons who know best how to feed; what foods to use, and the best manner of preparing the food for use.

The farmer may make more by feeding his crops well than by growing them. He may often make more profit by buying some extra food which can be had cheap and feeding it to some extra animals with his straw and hay. Some farmers make large profits by growing corn fodder and buying corn and bran to feed to cows, instead of growing corn for them, and some make money by growing wheat and barley for sale, and roots for feeding, and buying corn-meal to feed with the straw and roots, and buying sheep or cattle in the Fall to eat these. Because wheat and barley are worth more than corn to sell, and corn is worth more to feed than to sell. But the farmers that do this have learned the truth, that the business part of farming—which is feeding stock—may be made much more profitable, very often, than growing crops and selling them for others to use in feeding.

A USEFUL HOUSEHOLD ARTICLE.

(Prize Drawing.)

I have noticed that in many instances there is no place in which to keep the family spices except loose paper bags, or dilapidated tin cans; and the case is much the same with the table knives which are usually kept in a box or basket, or loose on a shelf, in either case, they are liable to become rusty, or covered with dust. The article, which is here described meets both of these wants. It may be made of ordinary, soft, clear wood, well-seasoned, and painted, with the trimming of a darker shade, or stained entirely black-walnut and varnished, or it may be constructed of hard wood, with walnut trimmings, and varnished. Its dimensions, exclusive of projections, should be about twelve inches high, twelve inches long and nine inches wide, with a thickness of three-eighths or one half an inch.

Fig. 322. is a drawing of the article, and Fig. 321, is a side-elevation of the same. At A, Fig. 323, is represented one of the receptacles which are not intended to extend back more than five inches, leaving space in the rear for a pair of drawers on either side, which will be found very convenient. The front edges of all these drawers overlap the surface of the case slightly, so that a close joint is made when they are shut. The handles used are brass-headed screws with rings inserted in their heads. The bottoms of the receptacles are set in grooves, as shown on the lower edge of I, and the joints are glued, besides being fastened with brads. If so desired, the smaller boxes may be fitted with covers having a thumb notch in each, as at B, and sliding from the rear in grooves in the sides and front. F represents the knife case, with its partition, G, in the center, and it may be lined with some soft substance, or a better way is to make racks, shown at K, fitting the case pretty closely, and having notches across the top, lined with a strip of leather running down into each. C represents the feet, which are put on over-lapping the lower edge of the chest, and their moulding, M, is applied to finish off. L is a section of moulding which may be placed on the front and sides, in the corner, under the projecting edge of the top, which should be rounded off along the edges, as well as at the front of every drawer. D and E are sections of pieces upon which the receptacles slide, and one of which they should have at each corner to hold them in place; the strip, D, is for the top, bottom and interior of the case; the other, E, is for the sides

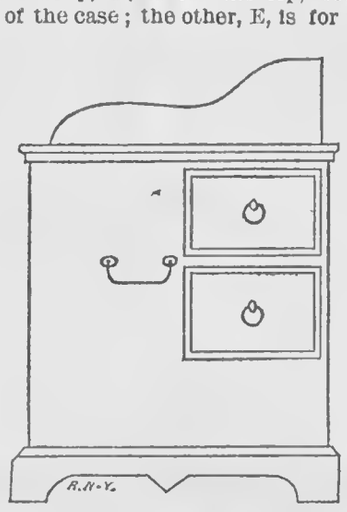

FIG. 321.

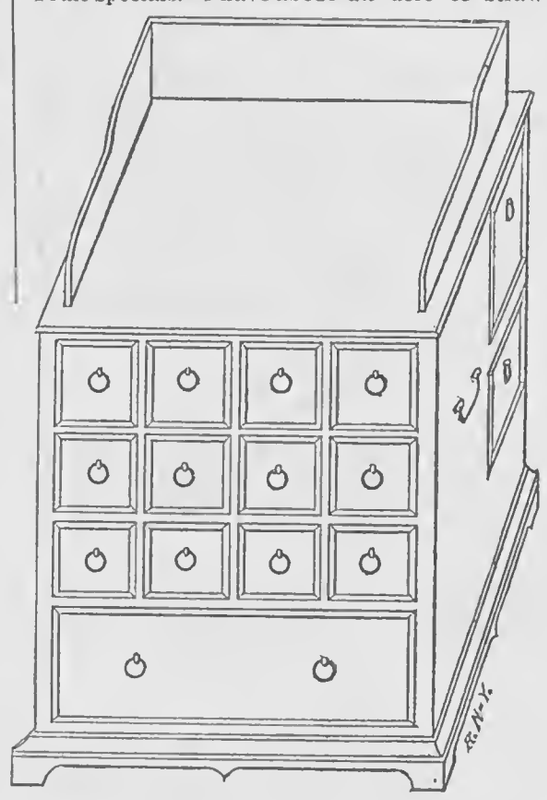

FIG. 322.

and corners. H shows the construction of the front, and J the manner of joining the pieces which form the front. N represents a variety of center moulding, which may be applied to the front of every drawer, as in A, but it is not necessary. A guard set in grooves on the top will be found very convenient, and some small handles may be placed, one on each side, as in Fig. 321. The smaller boxes should be lettered or marked in some way to show what each contains, and the whole makes as useful and ornamental an article as one is likely to meet anywhere.

Chelsea, Mass. C. A. Butterworth.

THE PRIZE DRAWINGS.

This week I have the pleasure of announcing the name of the successful competitor for the book of poems offered in the Rural of Feb. 19, for the best drawing of a useful or ornamental article combining originality and accuracy. It is C. A. Butterworth of Chelsea, Mass. There were only five competitors out of our large circle of cousins, but the five did well, and so well that I shall forward to the four second best, if I may so say, four engravings suitable for framing. I was especially pleased with one who stated that his drawing was the seventh one he had made in trying to attain perfection. I wish to encourage all who entered the contest to persevere in their work as the five drawings submitted were all highly creditable. The successful drawings accompanied with description appear on this page over the author's name and to him I shall send "Songs, Legends and Ballads" by James Boyle O'Reilly. U. M.

THE YOUNG QUERIST.

C. M. T., Deer Valley, Col., asks, 1, if cut-worms increase every year or do they come occasionally; 2, are Green Globe artichokes hardy, or do they freeze easily; 3, what are the names of the flowers which he sent to us?

Ans.—1. Yes, they reproduce annually. 2, Very hardy; 3, Specimen *a* is a clematis, or Virgin's Bower, *b* is a Delphinium or Larkspur, *c* is a Sisyrinchium or Blue Eyed Grass, and *d* is an Helichrysum or Everlasting Flower.

W. P. D., Mossing Ford, Va., 1, sends, for name, some beetles such as infest his seed turnips, and asks the remedy for them. 2, is there a more convenient method for removing worms from chickens' throats than by means of a feather.

Ans.—The turnip flea-beetle of the *Halticadæ* family. 2, We know of none which at the same time is as efficacious. Some recommend shutting the chickens in a box, with some shavings dipped in spirits of turpentine, when the vapor arising from the turpentine is said to produce a cure. Creosote may be used in the same manner.

W. B., Cherry Valley, N. Y., asks if Paris Green, London Purple, and Pyrethrum are poisonous to human beings; 2, where can Pyrethrum be obtained.

Ans.—1, Pyrethrum is not, the other two are; 2, Pyrethrum can be obtained at nearly every drug-store in the city or country.

LETTERS FROM THE COUSINS.

Dear Uncle Mark.—I intended to write and join the Club before the "Free Seed Distribution," so that I might have a share, but as my brothers are subscribers for the Rural and have received their seeds, I shall try to be contented with the Dianthus this year. I am very much interested in the culture of small fruits, flowers, etc., and fully appreciated the Hardy Shrub and Tree and Small Fruit specials. I have about an acre of strawberries and if they equal my expectations this season and far surpass those of E. P. Roe (of whom I obtained my plants) in size and quality, Uncle Mark may look for a pressing telegraphic invitation to a "tea" composed entirely of strawberries, while I shall expect in return a request to fill a large order for "choice strawberry plants." I sold a few hundred last Fall and, with more and later varieties, shall expect to do a thriving business this Spring and Summer. "Experience."

Hornellsville, N. Y.

Dear Uncle Mark:—I am only eight years old, but I have only one brother and one sister alive. My brother is mate on a ship that runs from New York to Liverpool, and my sister is a governess in Liverpool, in a large family. She went to England with my brother on his last trip. Then I had one brother who is now dead. He was a great landscape painter in the city of London. I don't know what I will be. I might be a civil engineer or a member of the British Parliament, or a "land leaguer," but I hope not. We have had very cold weather here this Winter—30 deg. below zero. As I write the wind is blowing hard and the sand has drifted in the weeds in some places four feet deep.

Canada West. G. M. R.

Dear Uncle Mark:—Although we live in town we are studying agriculture. We expect to go West with mamma and papa, and then we will want to know how to grow everything pertaining to farming. We had a garden of our own last season and expect to have a nicer one this season. We got our plans laid while it snowed. We like the Rural New-Yorker very much, and especially the pictures and your corner.

Rantoul, Ill. Archie and Fred Estep.

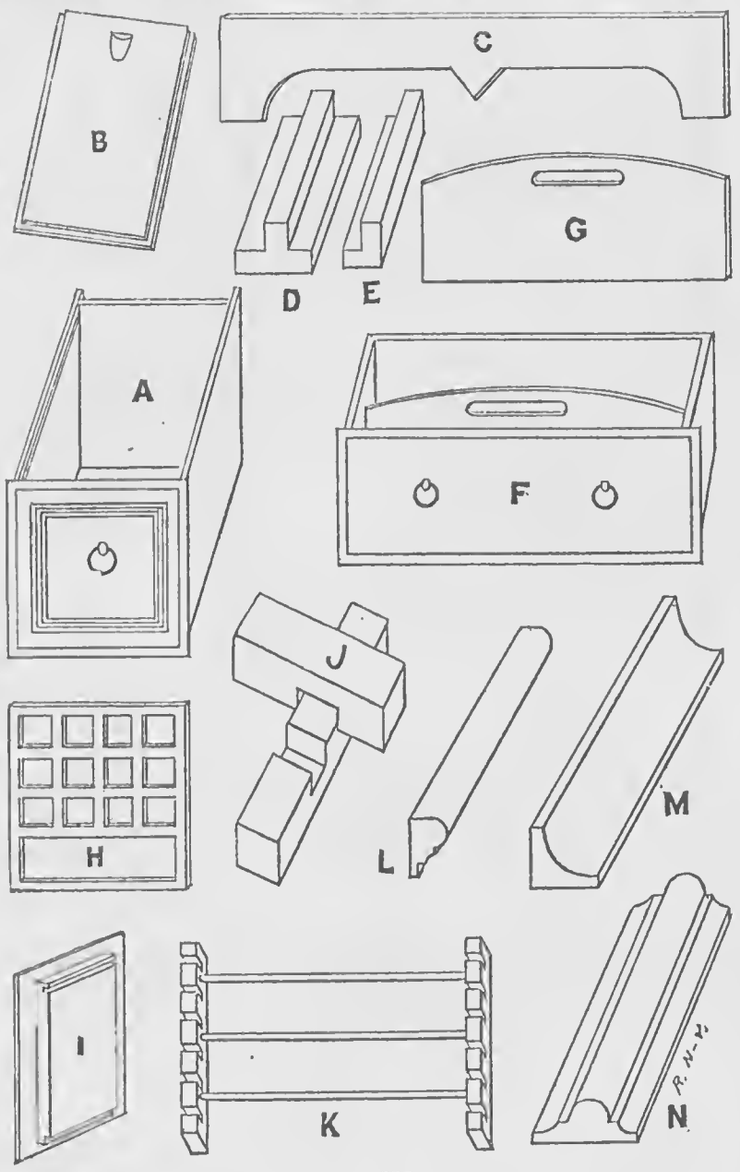

FIG. 323.

Sour stomach, bad breath, indigestion and head ache easily cured by Hop Bitters.—*Adv.*

Sabbath Reading.

COMFORTABLE WORDS.

There is no human heart but hath desired
Something at times beyond life's petty quest,
Beyond its daily round; we are so tired,
So hungering for comfort and for rest;
We see with envious eyes the children pressed
In ready arms that soothe their childish woe;
Oh! that we, too, upon a mother's breast
Such all-sufficient love again might know.

But what if, while these hidden longings haunt
Earth's restless denizens from age to age,
Filled with self pity at a fancied want
They spurn a greater love than they can guage,
Nor pause to gather from the sacred page
The comfortable words for their relief,
The tidings meant all trials to assuage,
The covenants that are as balm to grief?

'Tis strange, 'tis passing strange, we can repine,
And slight the voice which would our craving feed;
We learn to scorn the man that hath a mine
Of wealth untouched, if poverty he plead;
Yet—righteous Judges—do the like, who heed
So little what Himself, our Maker, saith,
With gracious words waiting upon our need,
"I, even I, am He that comforteth."

OUR LIVES.

Our Saviour tells us that the result of the maintenance of our position will be a marked fruitfulness, whereby God will be glorified. "He that abideth in Me, and I in him, the same bringeth forth much fruit." Let us endeavor to interpret this statement. Now we are not to understand, of course, that the man who is "out" of Christ, who has no personal connection with the Saviour, and who, it may be, openly disavows all allegiance to His name, is thereby rendered incompetent to perform actions which might, very properly and legitimately, be denominated "good." We believe most fully that the life of such a person may be characterized, and characterized in a marked degree, by integrity and uprightness, by freedom from gross sin, by liberality and open-handedness by a kindliness of disposition which shall serve to endear him to a wide circle of admiring acquaintances. We would give honor where honor is due; but at the same time we are anxious to distinguish. What the Lord speaks of in this passage are spiritual actions—and those only are spiritual actions which flow from the impulse and inspiration of the indwelling Holy Ghost, and which have God as their ultimate object and end. And what our Lord speaks of is "fruit whereby His Father is glorified;" and God can hardly be glorified in the conduct of those who repudiate His authority and turn their backs upon the offers of salvation made to them in the name of His incarnate Son. It stands to reason, does it not? that if a man pours scorn and contempt upon God practically by the rejection of Jesus Christ, God cannot be honored, but can only be dishonored by the life that the man leads?

THE WORKS OF GOD.

Science teaches us that we know not a millionth part of the marvels and wonders of this beautiful world. In fact, it is science which reveals to us that which a little thought prepares us to expect, a whole universe of invisible things and powers, "things not seen;" we are compelled to believe in what we cannot see; we can only see effects, we cannot see causes or things.

It has been truly said that the world of sight in which we live is a sort of central point or table-land, half way between the telescope and the microscope. But a very large portion of what we call the material world is invisible, composed of "things not seen." Heat and steam are invisible; we can *feel* a ray, and we can *see* vapor, that is, an invisible thing rendered visible by contact with cold air; but who ever saw the mighty giant at home in the boiler, the great moving power of the world? The force which drives a vessel of three thousand tons against wind and tide across the Atlantic, or hammers a twenty-ton weight of iron into shape as easily as you would mould a pellet of bread between your fingers? that five hundred or thousand horse-power nobody has ever beheld, only the vehicle through which it acts. Thus, everywhere a light shines guiding the mind to a principle of Divine order and proportion, all things turn into windows through which we may look out upon an infinite presence beyond; and so, to the thoughtful mind, the universe becomes another universe, and the world another world; it is all as if mysteriously haunted by a presence of Divine unity.

A BIBLE OLD AND RARE.

It is not generally known that in the Congressional Library, at Washington, there is an old Bible which is well worth a walk to the Capitol to examine. It is of Italian origin, and is supposed to have been written in the thirteenth or fourteenth century, but the actual date is unknown. It is written in Latin, upon vellum, in clear, bold characters, and extremely uniform. The writing is in two columns, about three inches wide, with a margin of two inches. It is embellished with 146 miniature paintings and upward of 1,200 smaller illuminations, which are beautifully executed, and are as brilliant to-day as the day they were done. The initials of books and prologues are two and a half inches in hight, and those of the chapters are one inch in hight. It is contained in two large volumes, and cost the government $2,200 in gold when gold was at a high premium, and was purchased at a sale of the library of Henry Perkins, Hanworth Park, near London, in June, 1873. The skins in the first volume have all been repaired, except five; in the second volume they are nearly all perfect.—Methodist.

Study Hop Bitters Book, use the medicine, and you will be wise, healthy and happy.—*Adv.*

PERSONAL ITEMS.

Lord Beaconsfield's late London residence, with its furniture, is advertised for sale by auction.

Lord Bute's new house in Scotland will cost $1,000,000. The great central hall will be 130x60; the great drawing room 60x23. Three hundred men are employed on the work.

A celebrated Lyons physician, M. Montain, says that smoking tobacco colors the bones. There is in France a society which has been formed to carry on a crusade against the use of the weed.

A young lady, who has an objection to the revision of the New Testament, writes to the London Truth to say that the phrase "purple and fine linen" conveys no idea of luxury to her mind, and she suggests, as an improvement, "sealskin and black velvet."

Vasily Tchmoomak, aged 96 years, has just died in the hospital of the Odessa prison, with the reputation of having in the course of his existence committed, alone or in conjunction with others, 80 murders, and also of having escaped no fewer than five times from Siberia.

President Waite of the First National Bank of Brattleboro has gone to prison for six years. His crime was that of using the bank's money in outside speculation, and, while concealing the actual condition of affairs from the directors and depositors, letting the concern go to ruin.

Miss Gordon-Cumming says that a venerable cannibal in New Zealand whom she visited, in company with an obese divine, stroked down and gently prodded the reverend gentleman in a manner painfully suggestive of Sydney Smith's joke about "cold curate on the seaboard."

As the Princess Louise has managed not only to tide over the date last fixed for her departure, but to make the question of her return to Canada as remote and uncertain as it well could be, it is exceedingly probable, says the London Truth, that she will now await the return of Lord Lorne to England, which is almost sure to take place in the Autumn.

Queen Victoria is quite as observant of trifles as ever George III. was, and overlooks nothing, and if the members of the royal family reside more than a certain number of days at Buckingham Palace they are obliged to "do for" themselves at the end of the specified term. A son-in-law of her Majesty, who was limited to three days at a time, evaded the regulation by going every third night and returning to begin a fresh stay the next morning.

[Springfield, (Mass.) Daily Union.]

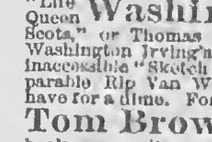
His Answer.

They tell it on one of our citizens who was ambling toward his place of business, that he was approached by a lady acquaintance of the family, who said: "Mr. ——, I hear you are suffering from rheumatism, is it so?" "Rumor 'tis m'm," said our citizen of few words, as he proceeded on his way. Over in Chicopee our neighbors and friends have been having quite a time with rheumatism; but according to reports received by our representative the flurry is over, as the sure antidote has been used and thus commented upon: Mr. C. N. Manchester, Cutler street, says relative to his experience: I have used St. Jacobs Oil, and esteem it the best remedy for rheumatism I have ever tried. It acts like magic, and I cannot over estimate its value, when I pronounce it the greatest rheumatic remedy of the age.—*Adv.*

Miscellaneous.

The Literary Revolution.

To keep in good humor the good people who delight in good books; to wake up the slow booksellers who are inclined to go to sleep in the summer, instead of, like a 'possum, in the winter; and to prevent our friends, the book publishers, from forgetting us, we have concluded to publish a few more cheap books. If we are to name him at all, we must, of course, head the list with the Immortal Shakespeare, and will give you either his "Merchant of Venice" or "Hamlet," or any one of his fourteen other principal plays, in beautiful type, for 2 cents. At the same price you may have Macaulay's "Life of Frederick the Great," former price $1.25, or Carlyle's "Robert Burns," or Lamartine's "Life of Mary Queen of Scots," or Thomas Hughes's "Manliness of Christ." Washington Irving's wonderful, delightful, heretofore inaccessible "Sketch Book," which contains the incomparable Rip Van Winkle, you can have for a dime. For the same price we will give you "Tom Brown at Rugby," the best boy's book ever written, except "Robinson Crusoe," which you can have also for 10 cents. To charm those who delight in fiction, we give also for 10 cents each, Cooper's "Last of the Mohicans," one of the most justly celebrated American novels, and Charles Kingsley's "Hypatia," which worthily ranks at the very front of famous historical fiction. These are only specimens of the cheap books we publish, are all in good type, neatly printed, and are not in the broad side or any other "slim" or "square" style, but handy pocket volumes, of course in paper binding. Our motto, however, has always been that a book worth reading is worth preserving, as well as worth owning, and our large list of standard books, to which we are making additions, with speed unprecedented in the history of publishing, are all elegantly and strongly bound, in cloth or better style, and sold at prices proportionately low with those in paper covers. We issue these few only in pamphlet form, as specimens of the quality of our good literature, and these special terms will not be long continued. 5,000 Booksellers throughout the United States and Canada are prepared to either abundantly supply or liberally slander our publications. We give liberal terms to clubs where no bookseller acts as agent. Descriptive Catalogue, and illustrated pamphlet describing book-making and type-setting by steam, will be sent free, on request. AMERICAN BOOK EXCHANGE, 764 Broadway, New York.
JOHN B. ALDEN, Manager.



KNOW THYSELF. GOLD MEDAL AWARDED the Author. A new and great Medical Work, warranted the best and cheapest, indispensable to every man, entitled "The Science of Life, or Self-Preservation;" bound in finest French muslin, embossed, full gilt, 300 pp., contains beautiful steel engravings, 125 prescriptions, price only $1.25, sent by mail; illustrated sample, 6 cents; send now. Address Peabody Medical Institute or Dr. W. H. PARKER, 4 Bulfinch St., Boston.

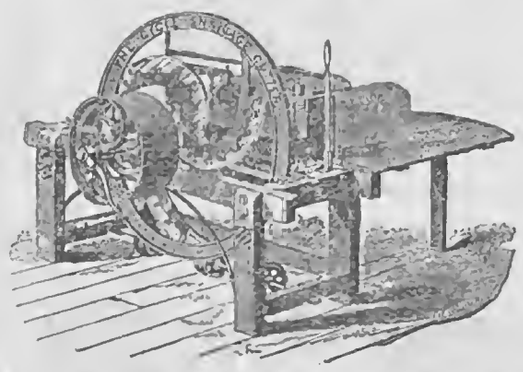
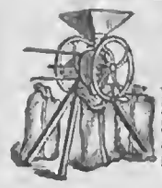
Implements and Machinery.



OUR CYCLE ENSILAGE CUTTER.
Is made on the only correct principle for cutting, with safety and small power, Stalks and Grass for Ensilage, also Dry Fodder. Four sizes, $50 to $150; capacity two to ten tons per hour. Reference to largest Ensilagists in U. S. Satisfaction guaranteed. Larger sizes exchanged for smaller. Goffart's Treatise with Latest Facts, How to build Silos, &c. Price 30 cts.
THE N. Y. PLOW CO., 65 Beekman St., New York.

THE CELEBRATED

Butterworth Thresher
Is a strictly FIRST-CLASS MACHINE, and the best in the market. It threshes complete, and beats them all in cleaning and saving the grain. Wherever there is threshing to do, an enterprising man with this machine is sure to take the lead and secure a steady run of work. They are made in sizes to suit Steam, Lever or Tread Power. For Circulars address JNO. BUTTERWORTH, Supt. New Jersey Agricultural Works, Trenton, N. J



FARM GRIST MILLS
AND CORN SHELLERS.
Over 25,000 Now in Use.
Every Machine is fully Warranted. Price of Mills, $15 to $35 Sheliers, $5. Don't buy a Mill or Sheller until you have seen our terms and Illustrated Circular. Address, with stamp, LIVINGSTON & CO., Iron Founders, Pittsburgh, Pa.

COMMON SENSE ENGINE.
Simple, durable, of the best workmanship and material. Solid Wrought Iron Boilers. Engine complete on board cars at Springfield, O., at following prices: 3-horse power, $375; 5-horse power, $300; 7-horse power, $375; 10-horse power, $500. These engines fully guarranteed in every respect. Address Common Sense Engine Co., Springfield, Ohio.

A $2.50 Corn Sheller.
The only cheap, practical Hand Corn Sheller ever invented, is without a rival, doing its work rapidly, perfectly, and with less labor than any Sheller in use. Sample sent to any address on receipt of $2.50. State and County Rights for sale.
AGENTS WANTED.
Address L. M. DEVORE, Freeport, Illinois.
Manufacturer and Sole Proprietor.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness

The Horseman.

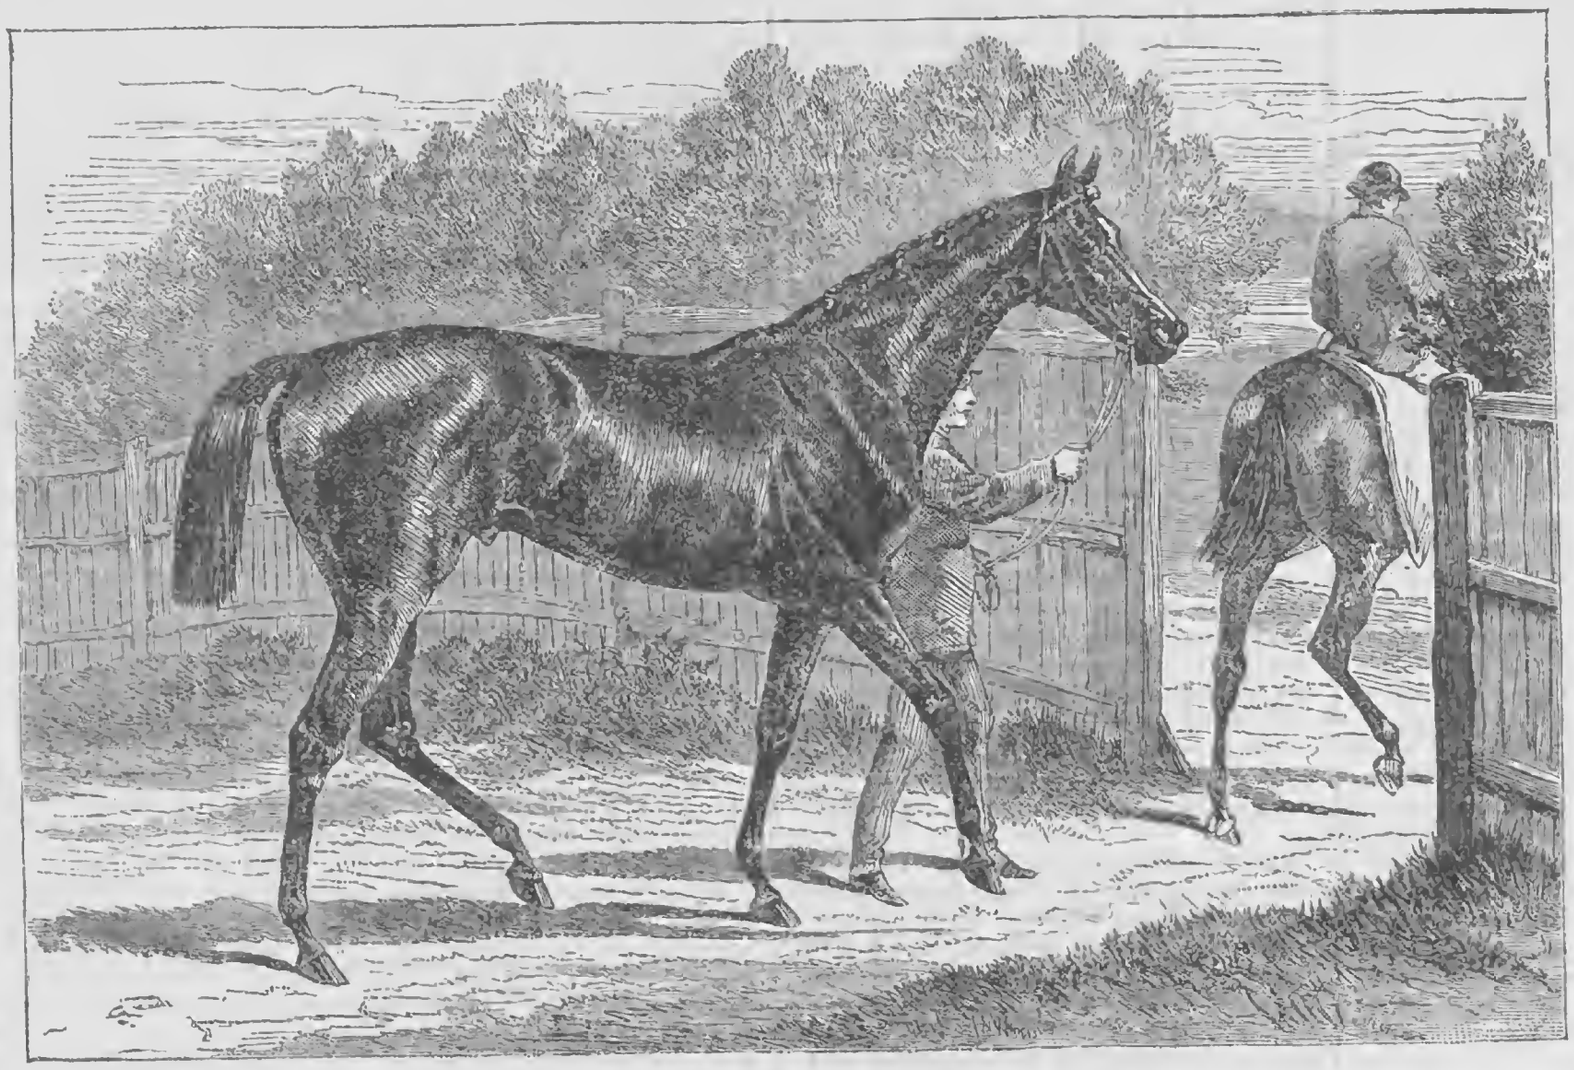
THE DERBY WINNER.

AMONG all the world's annual horse races the Derby is easily first. It was founded as long ago as 1780 by the Earl of Derby, and is run by three-year-old horses, on the Wednesday preceding Whitsuntide, upon the downs near Epsom, a small town a dozen miles southwest from London, rendered famous by this and other races, the foremost of which is the Oaks, for three-year-old fillies, and also by the manufacture there of the medicinal salts which bear the place's name. Situated within such a short distance of the most populous city on the globe, a city with a population of about four millions, the attendance at this great race always numbers from a hundred thousand to a quarter of a million people. On the Derby Day London holds a holiday, and even both houses of Parliament adjourn to enable the members to attend the race. On that day all the roads from the mighty metropolis to the race-course are thronged with all sorts of vehicles, from the coster-mongers's donkey cart to the prince's four-in-hand drag, while morning and evening and far into the night the side-walks are densely packed with curious spectators of the going and returning crowd. It is the only day the whole year round in which sober England witnesses a specimen of the gay excitement of the continental carnival.

It is hardly possible, outside of Great Britain, to form a just idea of the prestige and fame attached to the winner of the "Blue Ribbon of the Turf," a phrase aptly applied by the late Disraeli to the winning of the Derby, in reference to the blue ribbon which forms the special badge of the Order of the Garter, enrollment among whose members is the highest honor an English sovereign can confer. Every winner of this race since its establishment has by his victory won a name and a standing in equine history such as could be derived from no other single achievement. Just as in the Olympic Games of old, victory brought honor to the town, aye, even to the State, in which the conqueror dwelt, so a Derby triumph reflects renown on the owner of the winner and even of late, since the affair has become an international one, upon the country which may have produced him. It is this consideration that justifies the elation which has been caused in this country by the late victory of an American, the first ever achieved since the foundation of the race a few years after the achievement of our independence.

Iroquois, the American horse that on June 1 wrested victory for the Derby Stakes from the best three-year-olds the world could produce, is by Leamington out of Maggie B. B,, and was bred at Chestnut Hill, near Philadelphia, by Mr. A. Welch, who sold him, when a yearling, to his present owner, Mr. Pierre Lorillard, who soon afterwards sent him to England to compete for the prizes of money and renown to be won on the British turf. There his two-year-old career was of a somewhat chequered description. Out of twelve races in which he ran he carried the American colors to victory in only four. He came out with a great reputation at the Newmarket Second Spring Meeting where he won the Two-Year Old Plate very easily. In his next three essays, however, he was only once successful, and on that occasion, at the Epsom Summer Meeting, he had only a single opponent, and that a second-rate one, although the odds were three to one against him. Shortly afterwards, at the July Meeting at Newmarket, he fairly astonished everyone by running the famous racer, Bal Gal, to a head in the July Stakes, and cantering away with the Chesterfield Stakes the next day, defeating nine speedy competitors. His next winning appearance was at Goodwood where he carried off the Levant Stakes; but he was defeated in his last four contests last year. As a two year-old his total winnings amounted to $13,210. Before his late crowning triumph he had been out only three times this year, running second to Peregrine for the Two Thousand Guineas, cutting down Lennoxlove for the Newmarket Stakes and "walking over" for the Burwell Stakes.

As seen by the accompanying likeness, Iriquois is a handsome animal though a trifle light and small, standing a shade under fourteen hands three inches. He is a brown colt with a narrow blaze on the face and a little white on the near fore heel. He has a good head, and though his neck is just a trifle light, it is well set on. Probably his strongest point is his shoulders, which are unusually deep and well set. He is light in the flanks, however, and his quarters though muscular are certainly not massive. His feet could hardly be better and his legs, splendidly shaped, are sound, free from blemish and as hard as iron. The soundest of legs, wind and frame could alone speed him like a flash over the mile and a half course, under 122 pounds, and give him the proud position of being a Derby winner.



IROQUOIS, WINNER OF THE DERBY—Fig, 324.

Dairy Husbandry.

THE DAIRY COW.

HENRY STEWART.

Management of a Calving Cow.

IT may be good fortune that in the course of more than 25 years of keeping cows, I have never had any sort of accident with a calving cow; never lost a calf; or had a cow with a more serious attack of garget than could be overcome by the simplest remedy in the course of a few hours. But I do not believe in fortune or luck so-called excepting so far as that it is the result of timely cautions, and careful prevision of, and provision for, any possible danger. It is safe to avoid risks and to begin to avoid them in time. The man who never goes into a boat will never fall overboard; and the dairyman who is ever on the watch for risks and dangers, and contracts a habit of cautiously avoiding them, will be insured against accidents. But to avoid dangers, it is requisite to know what they are and how they come; and with regard to incoming cows it may be well to refer to the most common sources of mischief, and consider how they should be averted.

The most frequent trouble is with the udder. This either becomes congested and hard, or seriously inflamed. The most serious trouble is puerperal or milk fever. Both of these are easily prevented, but not so easily cured. A few days before calving the udder becomes enlarged and full and the more so with cows that have been highly fed or are large milkers. Precautions are necessary some time before this happens. As soon as the cow has become dry, or if she is a persistent milker, at least four weeks before the calf is due, the food should be reduced and a cooling medicine should be given. No meal whatever is to be given; a bran mash may be useful occasionally if the bowels appear to be costive, but this is to be avoided unless in this medicinal way, and then it should be accompanied by a dose of two ounces of Epsom salts mixed with it. From two to four ounces of salts may be given with great benefit once a week until the cow calves. Costiveness is to be avoided with the greatest care and the bowels should be kept free and loose under all circumstances. The food in Winter should be hay; and two quarts of chopped potatoes twice daily will be useful. It is a great mistake to try to induce a large development of udder in the hope to procure a large milk yield afterwards. The milk should come after calving and not before. If it appears before the calf, and the udder is found to be full, the milk should be drawn in the usual way, but this is only advisable in case of an emergency, because the milking will only help to further stimulate the production of milk. It would be better to give a cow in this condition an ounce of saltpeter, which will act as a diuretic and have a cooling effect on the blood and thus relieve the udder greatly. If the cow is in good condition, this course of treatment is all the more necessary to avoid any danger.

The cow should be kept quiet and free from disturbance. In the Winter the drinking water should be slightly warmed and never given cold for ten days previous to calving, and the cow should be kept from exposure to cold. The separate pens previously mentioned will be found of great use. When the calf is expected it is well to visit the cow frequently, but not in such a way as to disturb her. At such a time will be found the advantage of the previous training of the cow to habits of gentleness by kindly treatment. If the presentation of the calf is right, there is no necessity for disturbing the cow in any way until the calf is dropped; when the cow is better tied up in the usual manner. It is a natural instinct for the cow to devour the placenta; and some persons think it right to defer to this instinctive desire; for what reasons it is difficult to comprehend. The whole management and training of the dairy cow is a strife against her natural proclivities and in this respect it is better to adhere to our artificial training than to permit her to follow her instinct. For this reason it is better to tie up the cow, leaving the calf at her head.

There is a difference of opinion as to the propriety of permitting the calf to suck the cow. I believe it is better to prevent it, and therefore always take away the calf as soon as the cow has cleaned it and before it has sucked. It should be removed to a distant pen, provided especially for the calves, where it can be kept in quiet, and warm and comfortable, with plenty of room to gambol when it feels inclined. The cow may be milked in six hours after calving, and by that time will have become oblivious of the calf, if it is out of hearing. Many a cow has been so nervous by the worry of having her calf near her or with her that an attack of milk fever has been brought on by it. This disease is especially a nervous one and quiet will prevent it, if there has been a judicious management previously. In an hour after calving a pailful of bran slop with

four ounces of Epsom salts and a handful of salt dissolved in it, will allay any feverish symptoms that may appear. But previous care will usually have avoided any risk of such trouble. If the cow has been kept in good order, she will come to her milk without difficulty. If the milk does not flow freely, she should be milked three times a day and the calf be fed immediately. If the udder becomes hard it may be rubbed gently with the hand and Veterinary Cosmoline (a most valuable preparation of crude petroleum) be applied and rubbed in liberally. I have never found this application fail to cure a case of garget, and when it has been applied at once, one application has usually restored the udder to its healthy condition. The cow will never withhold her milk for the calf, if the calf is removed from her. One of my cows which has had three calves, and which has never been sucked and never sucked when a calf herself, takes no notice whatever of the removal of her calf and comes to her milk without the least trouble. This is a matter of training, of course, and it may not answer so well with old cows not "to the manner born." But in a dairy where the calves are raised and the cows are reared at home, very much depends upon a regular method of training. This, however will be more fully considered in its proper place hereafter.

When an attack of garget becomes serious, immediate and active remedies should be applied, otherwise the cow may be spoiled for the whole season of milking. In addition to the use of the Cosmoline, or even sweet oil, or fresh butter from the churn, without salt, and gentle and long-continued rubbing and kneading of the udder, a brisk dose of 12 to 16 ounces of Epsom salts should be given. In six hours after this one ounce of saltpeter may be given. Two quarts of sliced Poke Root, *Phytolacca decandra*, commonly called garget root—a tall plant with bunches of dark purple berries in the Fall—has been given with the best effect. The food should be suddenly reduced, or even wholly withheld, for 24 or 36 hours; and only water with a handful of bran stirred in it be given. If milk fever should occur by an unforseen accident, the same course of treatment will be proper, but copious bleeding, at the first attack, from the vein in the neck, will be advisable. The legs should be bathed and rubbed in hot water with mustard stirred into it and the body be wrapped in a blanket. A rug dipped in hot mustard water may be laid along the spine and covered with the blanket. Fuller directions for treating the diseases incident to this condition of the cow will be given hereafter. Here it is sufficient to emphasize the fact that care to prevent it, at the right time, is more effective than treatment when the trouble has arrived.

Field Crops.

CORN ON THE RURAL FARM.

I REGRET to hear of the discouraging appearance of this up to the present time, and hope we may soon have warm, dry weather to improve it rapidly. But, thinking over this in contrast with my own, perhaps a few observations on the subject may be of advantage to some of the RURAL's readers. My soil, as I am informed, is much like that of the Rural Farm. It is about the same distance from the ocean, but one degree farther south.

The first corn planted was the Minnesota and Crosby Early Sweet for the table and for soiling stock. This was in the latter part of April. It came up early in May, and, notwithstanding about half the weather since then has been unusually cold and rainy, it has kept a deep green color and grown well. Much of this half time the wind has been a strong, raw northeaster, the thermometer ranging from 42 to 46 degrees at night and not over 52 to 58 degrees during the day. One-fourth of this whole weather was cloudy and misty, the other fourth sunny, several days being quite hot. This brings it to the 15th of June, at the time of my writing, when the corn leaves are generally from two and a-half to three feet long, and it will probably tassel within a fortnight. It must be recollected that these two sorts of corn are dwarfs. Tall field corn was not planted so early and is not yet so high, but will soon surpass the dwarfs.

The soil here is a light, gravelly, yellowish loam and was treated in the following manner: Last November it was coated with coarse stable manure at the rate of about 10 two-horse loads per acre, which lay on top of the ground all Winter. Just before the corn was planted this was plowed in, half a shovelful of compost was put in each hill, two or three inches of soil were drawn over it, the corn was then dropped, covered well and spatted down. After the first hoeing, the crop being then five to six inches high, a tablespoonful, moderately heaped, of guaranteed Peruvian guano was dug in an inch deep or so around each hill, about three inches from the corn. The raw, cold, rainy weather has certainly been greatly against the corn, and I am surprised to see it of so deep and bright a green and growing so rapidly.

A. B. ALLEN.

REMARKS.—Mr. Allen should bear in mind that though all of our corn is backward, we have chiefly alluded to that of the unmanured field. Now the soil of this field is, without doubt, extremely poor, and the old, miserable sod turned under is the most the plants have to live upon. We had proposed to cultivate this field *well* in order to show what cultivation could be made to do for Indian corn. The system with most of our farmers is to manure well and to neglect cultivation. It is plain to our mind that better cultivation and less manure would prove more profitable. Our readers are asked to bear in mind that *one* acre of the main corn-field *is* manured with 600 pounds of concentrated corn fertilizer, while plots are manured with different constituents and combinations of concentrated fertilizers with a view to determine which is, for our soil, the most serviceable. Again, as the present corn-field is much the same as last year's "Chester" field, which gave the immense yield, we were anxious to determine, if possible, how much was due to the commercial fertilizer used upon it, viz., 350 pounds to the acre. We would state that our bad stand of corn in the main corn-field is due in a great measure to the persistent depredations of black-birds, which have troubled us more than ever before.—EDS.

THE FERTILIZATION OF WHEAT AND CORN.

PROFESSOR A. E. BLOUNT.

WHEATS will not mix in the grain however closely they are planted. I do not say it is an impossibility for them to be crossed sometimes. Insects may—when very small—carry the pollen of one kind into the glumes of another variety, and a cross may in this way be produced. Such cases are rare. Wheat, rye, barley and many of the grasses are hermaphrodite, or bisexual, having both stamens and pistils in the same flower. The fertilization is accomplished before the anthers appear on the outside of the glumes, hence the pollen in every perfect specimen is never found outside on the anther in any but the dry (dead) state. I have never seen any sign or effect in wheat growing and wheat fertilization, that would lead me in any way whatever to declare that wheats of, and in, themselves will mix in the grain. They cannot cross. If new varieties are made they must be made, not naturally, but by insects or mechanical processes.

No cross can be effected after the anthers appear outside. Extracting the three anthers between the palets before they (the anthers) are ruptured, will produce an abortive head. The stamens are ruptured quite early while pushing against the inside glume-covers (palets), and, of course, to make a half-and-half perfect cross they must be removed quite early—before the pollen in, or on, them is loosened.

Corn mixes naturally and easily. It crosses by gravity and is crossed by insects and winds. The wind will effect a cross half a mile away; insects (bees in particular) will carry the pollen of one to the silk of another variety five miles off. *In no case whatever will the tassel of a given stalk fertilize its own silk.* This is a bold assertion; but I shall stand by it until my own experiments prove the contrary. For four successive years have I covered given ears—in embryo—and prevented all but their own pollen from falling upon the silk—result, not a grain of corn in any case. The tassel and silk do not always ripen—do not come into "season" for fertilizing—simultaneously; hence the reason for so few ears on the stalks. I have many times gathered pollen and put it upon silks of lower ears when "in season," and found in almost every case a perfect ear from the operation.

Colorado State College, Ft. Collins, Col.

EXPERIENCE WITH RURAL SEEDS.

The White Elephant Potato which the RURAL kindly sent me weighed nearly 2½ ounces, contained 11 eyes and was cut into 11 plants about the 15th of March, and planted in 11 pots in my green-house. I propagated from these until I obtained 26 nice plants, and I transplanted them into my garden about May 15. They are looking splendid and some of them have commenced to bloom. The package of Washington Oats contained 1,115 grains. They were sown about the middle of April in 12 rows, each row about 17 feet in length, by the side of the same number of grains of the White Russian, but the latter have 14 rows instead of 12, though all the rows are of the same length. They are all looking fine; are more than a foot high and about cover the ground; 1,014 grains of the Russian were equal in weight to the 1,115 grains of the Washington. [We wish more of our readers would take pains to test the relative values of new seeds. Eds.]

The two kinds of asparagus were sown in my onion bed. The seed was dropped about six inches apart, making a row of about eight rods in length; the plants are looking fine. A box, two feet wide, three feet long and six inches deep, was filled half full with inverted sods, the surface made even and fine, and the seeds of the Rural Branching Sorghum were planted about one inch apart in the row, with the rows two inches apart. Fine rich mold was sifted over the seed, and then a sash was placed over the box, and the soil kept moistened with water when becoming dry. The seed was sown early in May; about one-fifth of it grew. On May 28 I transplanted to open ground with a piece of sod to each plant; this was done to economize seed and plants, and also to plant out in freshly prepared soil. Since transplanting the weather has been remarkably cool, and one night we had a slight frost, so that the sorghum has not made much of a start, but nearly every plant is living, and seems to be waiting for warm weather to go ahead. I have a nice bed of pinks from the RURAL seed; some of them will soon be in bloom. I sowed the carnations in eight-inch pots; I have only five carnations, the rest of the plants appear to be the common pinks, but I am much pleased with them.

With one exception I have the best piece of corn in this section. I drilled in about 225 pounds of phosphate to the acre with a common grain drill, then marked off and planted on May 6, but most of the corn around here was planted late, and the cool, rainy weather has checked the growth of the corn and started the weeds, so that some corn fields are looking very bad. Wheat and Spring grains are looking well in this neighborhood, but the Hessian fly is doing considerable damage in some places. A neighbor sowed about 400 pounds of the Mapes phosphate to the acre with his wheat in 1879, and last Summer he harvested a little over 46 bushels of nice wheat to the acre. [What variety please? Eds.] A. P.

Scipioville, Cayuga Co. N. Y., June 17.

[We are much obliged to our friend for the pains he has taken with the RURAL seed. Eds.]

WHEAT IN VERMONT.

ALLOW me to congratulate the RURAL on its harvest reports. Newspaper men agree that they are more reliable than those of the Department of Agriculture. To think of private enterprise beating Uncle Sam! But poor Uncle S. is sick. The politicians are killing him, or will unless the people squelch the politicians. This, though, is not what I took up my pencil to say. Your Brandon, Vt., report says that owing to an unfavorable climate or soil, wheat cannot be raised there profitably. I think this is a mistake. Some eight years ago I had, while on a visit to Brandon, a conversation with one of the oldest citizens, now deceased (the late Judge June), who informed me that in his youth Brandon was a great wheat town, and that crops of 50 bushels to the acre were not uncommon. The climate has not changed since then more than in New York and other localities not far from Brandon, which still raise wheat successfully. The soil is changed from a new one to one more or less injured by bad farming. A farmer may know how to grow wheat "on a burn," or for a few years after clearing on strong soil, and yet be entirely ignorant of the method of growing that crop on old land. That he does not succeed on the latter is no proof that success is impossible. It is the "know how" that is lacking. The present generation of farmers in New York grow wheat as well as the first settlers. There was a time between the first generation of farmers there and the present when it was thought that wheat was a crop of the past. Then farmers of energy, or European training, showed the way to fit land for wheat, when and how to sow it to avoid insects and disease, and the wheat crop again became a staple. The glorious St. John Valley in Maine and New Brunswick (which is Central New York over again, only a little farther north,) is now going through the early experience of the Ontario and the Champlain Valleys. Wheat "grows spontaneous" in Aroostook, and crops of 40 bushels to the acre are common, while potatoes average 300 bushels, all without manure. In 20 years or less the "bonanza" will seem to fail; but then, skill and science being applied, a new generation of farmers will again see the old productiveness renewed. Doubtless it is to be so also in the Champlain Valley, which, being once the "garden," is now the most backward part of our State in agricultural skill. Too rich an inheritance has spoiled the farming in many places, so that the once best is now apparently the poorest. But it can all be restored. The "know how" and the will are all that are needed.

Orleans Co., Vt. T. H. HOSKINS, M. D.

Farm Topics.

EXPERIENCE WITH ENSILAGE.

OUR experience with ensilage is, briefly, as follows:—Late in the season last year we concluded to give this method of preserving fodder a trial, and therefore, between July 1st and 17th, plowed about 12 acres of land from which the hay and wheat had been taken, and sowed it with corn, in drills 28 inches apart, using three pecks per acre. We sowed it with a wheat drill and cultivated once that portion sown after wheat. The other received no cultivation. We built two silos each 33x14 feet and 16 feet high, costing $500, and having a capacity of about 300 tons. In September we cut the corn with a reaper and got enough to about half fill the silos. Before the corn, we put in about 20 tons of freshly-cut rowen.

From this we fed all our cows and sheep, averaging say 12 of the former and 175 of the latter, from the time they were put in the barn until March 24th, besides about 100 lambs which came in January. We fed the cows four pounds each of cotton-seed or corn-meal per day and cotton-seed to the sheep that had lambs. The cows were more thrifty than they have ever been when fed upon hay and grain, and the butter was as yellow as summer-made. The sheep did well.

The net results in dollars and cents were about as follows:—We estimate the 150 tons of ensilage to have cost us $150, and the extra cost of feeding it was about $50. The hay crop being short we would have been obliged to buy, say, $300 worth of hay: we sold $400 worth, so we have $500 clear to pay for the silos which we expect to *fill* this year and to feed nothing but ensilage. Having thus put the money in our pocket, we do not trouble ourselves about theories—whether there are more albuminoids in ensilage than in the same corn dried and cured as fodder, or whether chemical analysis shows much virtue in the material. So long as eminent chemical authorities admit that their analytical process will show little, if any, difference between the nutritive values of grass freshly cut, and the same as hay, well cured, or the same as hay cured after exposure to the dews and rains for a week, and while a cow fed upon the first will make yellow butter, upon the second white butter and a less quantity, and upon the third scarcely any butter, we prefer the practical test and leave theorizing to others.

COE BROTHERS.

Horticultural.

THERE has for some time been a difference of opinion as to whether Cereus MacDonaldii and C. Regelii are distinct plants. In view of the great difference in the price asked for the two plants, there ought to be a marked difference between them. But the plants are precisely alike in form and growth; the most critical examination of the plants, grown side by side for several years, has failed to discover any difference whatever. Two plants of the same age flowered with me at the same time, (June 10th.) I watched the buds and their opening from beginning to end; compared all the different parts of the flower in the minutest manner, as well as the size (about fourteen inches in diameter), and failed to find any difference. It may be said that my plant is not true. In answer to this I have only to say that my plant is from a cutting from the plant sent to Dr. Siedhof by Dr. Regel some years ago, and from which, so far as I can learn, all the plants of the so-called Regelii now in the country have been propagated. Some two or three years ago, in company with Dr. Kunzé (who is well posted in the Cactus family), I examined the plants at Mr. Such's, and we both came to the conclusion that they were identical. Shortly after this Dr. Kunzé, while traveling in the West, was asked eighteen dollars for a moderate-sized plant of Regelii. It may interest Western readers, therefore, to know that when they get MacDonaldii they get Regelii at the same time. It must be understood that Dr. Regel does not make this claim to distinctness; the name has become attached to the plant simply because it was received from him, and I have thought it just as well that this should be known. I will add that Cereus MacDonaldii is altogether a more magnificent flower than C. grandiflorus, the old Night-blooming Cereus, and is worthy of a place in any collection.

I AM surprised and grieved to learn from the editor that the Japan Maples are not hardy at the Rural Grounds. I venture to hope that his experience with them may prove to be somewhat exceptional. Will not the readers of the RURAL give us their experience with them, and be particular as to locality, exposure, etc? Even if they should prove to have been generally winter-killed at the North, their dwarf habit and beautiful foliage will still

command for them a prominent place as pot plants. I am always grieved at a disappointment of this nature. [There was but one killed outright—singularly enough the species (palmatum) upon which the others are grafted. Eds.]

In the Spring I had a talk with a member of the RURAL family about corn, and he decided to try to equal, if not surpass, the great yield obtained at the Rural Farm last year. He accordingly prepared about an acre of ground in the most careful manner, and put in the corn in drills. It came up quite evenly, and, as I saw it, looked very promising. The occupants of some shanties down in a hollow not far off, keep large flocks of geese, which run at large. These geese got in the lot when the corn was about three inches high, and destroyed nearly all of it. Did you ever see a man in a downright hearty, honest rage? Talk about the wrath of Achilles and the slaughter he made among the Trojans! It was slow, methodical work compared with the quick, headlong havoc Mr. B. made among those geese. I can scarcely conceive of anything more provocative of sudden and uncontrollable wrath; still I cannot help thinking that my friend should have punished the geese less and the owners more.

It will be well for those who grow mangolds to bear in mind that they may be transplanted about as easily as a cabbage. The thinnings, therefore, should be used to fill up vacancies, not only in the rows of mangolds, but elsewhere as well. They should be transplanted when the ground is moist, and preferably near the close of the day. I used to sow a bed of them to be used all over the place, wherever a vacancy could be found for them. You cannot have too many of them if you keep cattle.

Who is making preparations to do something to make his county or his State Fair more instructive and interesting than heretofore? If things were not judged as they are, I would say, take that which gives the best representation of your average results and best illustrates your method of farming; but as things go, you must devote extra time and attention to produce something that will be so good as to attract public attention, and show what *may* be done. After all, this method is not without its usefulness. "Excelsior" is a good motto for the farmer, only his products must not be made to cost more than they are worth. Anyhow, do something for your fair, and encourage the boys and girls to do so too.

The New York Horticultural Society, at its Spring exhibition, had a grand show of strawberries; the strawberries, in fact, overshadowed every thing else. Mr. Roe, Mr. Lovett, Mr. Henderson, and, in short, all the principal strawberry growers within reach of New York, were represented by excellent examples of fruit. The long-continued rains gave size to the berries, but washed out some of the characteristic goodness, or perhaps I should say the absence of the sun failed to develop it. I have no room in this column for a general notice, but I may say briefly that the exhibition was a good one, all its material being excellent. The rooms used seemed to keep plants in better condition than the concert hall. At all events, the plants were in much better condition than usual on the second day.

HORTICOLA.

NOTES ON STRAWBERRIES.

The strawberry is year by year claiming more and more attention as a fruit no longer for the epicure, but for the toiling millions as well. The great importance this fruit is assuming calls for a few suggestions.

First, the land should be well enriched with good, well-rotted compost (never with crude, unrotted manure), or with some special manure. The Matfield, Stockbridge, Mapes, or Forester Strawberry Manure furnishes the needful plant food in its best form for immediate effect. An acre with the requisite conditions all right will yield astonishing results. But the question of varieties is the main one I was about to touch upon.

Varieties.

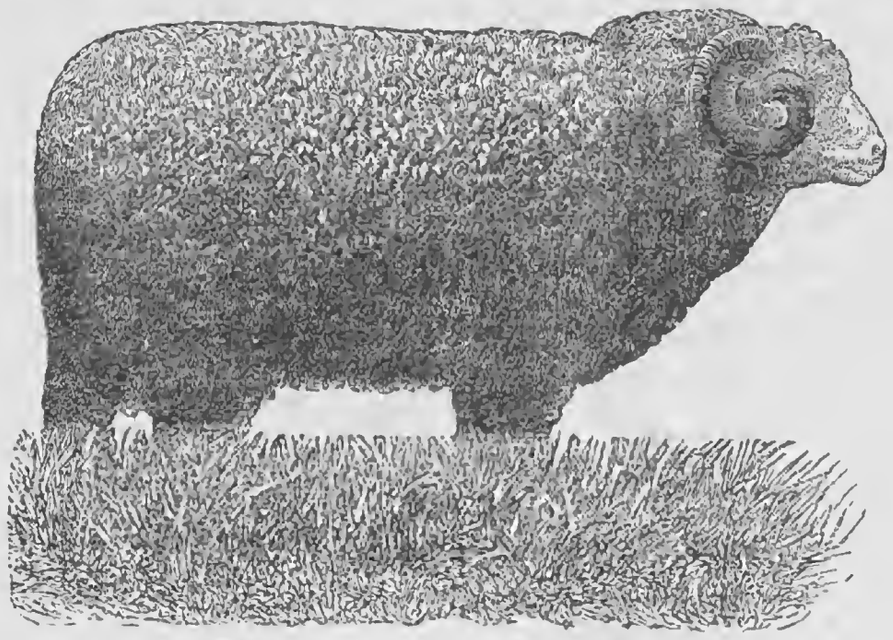
The CRYSTAL CITY, which has been called the earliest berry, is behind the Crescent and Duncan on my grounds this season. The Crescent Seedling has given some good and early fruit. No berry, perhaps, has varied more in productiveness, size and quality. At its best, it is enormously productive, early and fairly good; but it demands good treatment as much as any variety I know of, and it should always have some variety, like the Duncan, that blooms with it, to fertilize it.

The DUNCAN is the best early berry that I have. In hill culture it makes enormous stools, is early, productive, moderately firm, of good size and excellent quality.

DUCHESS is also an early berry, well adapted to hill culture—good and productive.

CHARLES DOWNING is a variety which is very popular in Connecticut. It is reasonably productive, of good size and great beauty, and it holds out well for the season. In the markets it is much sought for, and sells well.

SHARPLESS, which was good last year, was also excellent this year. In productiveness and quality it is holding its reputation well.



FIRST PRIZE RAM AT MAGDEBURG—FIG. 325.

PHOTO, or MARTHA, I have fruited three years, and wonder that it has not made more noise. It is certainly a modest variety from a modest man—Mr. Crawford. I say all praise to the Photo, and place it well up towards the head.

CHAMPION and WINDSOR CHIEF are both producing well, resemble each other closely, and if they were better in quality they should be largely planted.

COL. CHENEY has always been a large yielder, but is not firm enough for long shipment—pistillate.

PRESIDENT WILDER, as to quality, is one of the very best; but it is not hardy, vigorous or productive enough for common field culture.

WARREN is a most beautiful berry, but I fear it is not going to be productive enough for field culture.

RED JACKET promises well as to growth, productiveness and high quality.

MONARCH is a good berry, but not productive enough.

MINER'S PROLIFIC promises to fill the bill in many, if not most, respects.

GREAT AMERICAN is an enigma. When it does its best it is good enough and productive enough to satisfy the most exacting. I saw, last year, on exhibition, 50 berries of this variety weighing 56 ounces, and whole fields of it in Essex County, N. J., that defied comparison. There are some patches in Connecticut that look surprisingly well. When it gets a strong, heavy soil and single hill culture it does well enough.

SENECA QUEEN is yet destined to make a stir in the strawberry world. It is one of the strongest, most beautiful and productive varieties I have. It stood the Winter remarkably well; it is of a strong growth; the fruit is large, attractive and of good quality. When we can get anything better than the Seneca Queen we shall have the best.

SHIRTS, from appearances, I think I shall like, but I must wait for further experience.

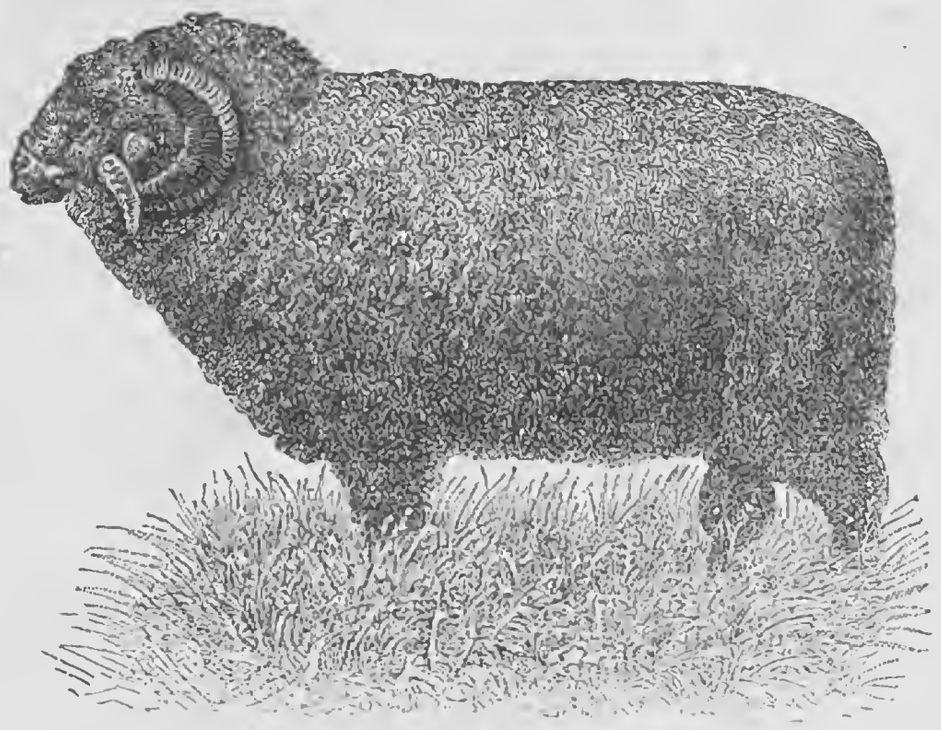
BIDWELL, ditto. Michigan men say this has a white tip, like the Monarch—time will tell. [We have seen several quarts of Bidwell this season and we did not notice a white tip on any.—EDS.]

ELM CITY is a new variety of handsome appearance and fine quality; but, as with a large batch of new seedlings, time must be taken to test it thoroughly before introducing it to the public.

DURAND'S GIPSEY I am expecting to see coming to the front as a valuable market berry.

KENTUCKY is a very valuable late strawberry. With me it has been excellent in years past.

GLENDALE is also valuable as a late berry.



FIRST PRIZE RAM AT MELUN—FIG. 326.

GOLDEN DEFIANCE is another valuable late berry.

Just as with grapes we want the hardiness and productiveness of the Concord with the good quality of the Iona, which we have not yet got, so with strawberries we want the good market qualities of the Wilson, the good table qualities of the President Wilder. The place is not yet filled; the goal has not yet been reached — there is opportunity to *try, try again*.

P. M. AUGUR.

Middlefield, Ct.

THE DEPTH AT WHICH TO PLANT PEAS.—The RURAL is right in regard to planting peas in ordinary soil three inches deep; but in deep garden soil that has been trenched to the depth of 15 inches they will bear longer and yield heavier crops if put in five inches deep. The ground, however, must be kept well cultivated, and one reason why I like deep planting is that it allows deep cultivation, and consequently a larger feeding ground for the roots. A. W.

GROUP OF PRIZE MERINOS FROM MELUN—FIG. 327.

A Prolific Marechal Niel Rose.

In the RURAL NEW-YORKER for June 18th, page 402, I notice a few remarks on the Marechal Niel Rose. I have a large plant of the Niel from which I cut 3,568 buds this past Spring. The greatest number cut at one time was 262 on April 13th. On April 3nd 179 were cut; on April 6th, 199; on April 9th, 195. The remainder were cut from March 28 to May 1st. My plant is nine years old and is budded on Malmaison. It is grown in a cool greenhouse with orange trees, camellias, etc., and receives no special care or attention. The Niel budded on a strong and healthy stock, is a truly superb rose.

C. E. P.

Sheep Husbandry.

FRENCH MERINO SHEEP.

If we Americans have surpassed all other nations in so improving the Merino, as to make it grow, in comparison to its size, the heaviest fleece of a good and almost perfectly even quality of wool, the French have certainly succeeded in producing such as are best in form. As an illustration of this, we have re-engraved from the English Live Stock Journal the three accompanying cuts, comprising several portraits of Merino sheep, the finest of which are bred in Soisonnais. It will be seen from these that they are as perfect in all their points as the handsomely formed English South Down! Like the latter they have no wrinkles in the skin, and we wish we could add that they were as free from the odious and useless excrescence of horns. They would indeed then be the most commendable of sheep.

What could induce any one in the first place to allow wrinkles we cannot imagine, for they are a decided nuisance, and of no earthly use whatever. It takes from three to five times as long to shear a wrinkled as it does a smooth sheep, and none but the most skillful workmen can do it without frequently and severely cutting the skin. The wool that grows on these wrinkles is of a short and inferior quality in comparison with the rest of the fleece, and they often produce long coarse white hairs, technically called *kemp*, which considerably lessen the value of the fleece. The only apology we have ever heard for allowing wrinkles to be bred in the skin was, that being thus enlarged, it grew more wool. But when more wool is wanted, it would surely be much better to increase the number of smooth sheep to obtain it, rather than ugly, wrinkled skins.

The size of full-grown Soissonnais sheep is not given, but we presume it is larger than that of South Down, because in an exhibition of a lot of seven-months lambs, the average weight of each was 123 pounds. This is quite as great as the usual weight of Oxford Downs. They mature a year sooner than common Merinos, which is a decided advantage in their breeding, as it enables the flock-master to turn his capital this length of time the sooner, and it lessens the risk incurred in their rearing. We should think it an object to import and breed some of these sheep at the West, for the probability is on the rich lands there, they may easily keep up the size without extra feed or care. We should judge also from their form, that they would make mutton superior to that of the ordinary Merino; and, if so, there would be the double advantage of having animals which not only produce a large fleece of fine wool but at the same time yield a choice carcass of meat.

SHEEP RAISING.

The profits of sheep depend to a great extent on the way they are managed and treated. Some persons will not succeed in any kind of business through neglect, or lack of knowledge of that particular kind of business. The fault is, not with the business, but with the person so engaged. Some think that a flock of sheep should yield a nice profit without care on their part; many persons who engage in sheep raising seem to think that their animals can take care of themselves. This is an erroneous idea, and very fatal in its practical workings. In fact, there is no stock that requires closer watching or care than sheep, and when they have that, there is no branch of business that will pay better on the money invested than growing sheep either for mutton or wool; but a knowledge of the business is requisite to success. Suitable land should be the first object of those who intend engaging in the business; sheep will not flourish on wet soils, but the most suitable are those naturally drained, with a gravelly soil. Low undrained land on a sheep farm may cause disease to a whole flock. It will not pay to raise sheep on all land worth $50 per acre, unless it is adapted to their growth and development; but it is said that it will pay to raise sheep on land worth $100 per acre, and then the gross yield will be two hundred per cent. upon the original cost, within one year. There is an increasing demand for the supply of wool, and the demand for mutton is also on the increase.

Many persons here are using less pork, and more mutton; and, taking all things into account, it seems that there is no business which promises quicker and larger profits than the production of wool and mutton. In Putnam County, Ind., the number of sheep returned to the assessors is 30,608 head, and the amount of wool, 138,738 pounds. T. C. G.

Greencastle, Ind.

SHEEP IN INDIANA.—There are quite a good many sheep raised in my county, principally Cotswolds and their grades. They are raised for wool and mutton, yielding an average of about nine or ten pounds of wool to the sheep. Lambs are shipped in the last half of June and July. They are dropped in March and April. Buck lambs are shipped to market for mutton, ewe lambs are kept for breeding. Sheep have to be fed on dry feed from four to five months in the year, owing to inclement weather. When there is no snow they will live on the Blue Grass. Wool is marketed here in the county where it is consumed. It is worth 25 cents per pound at present. S. E. Q.

Floricultural.

THE IVY.

THIS is a foreigner of great distinction and high repute among us, but alas! too fastidious to serve as many ends in this country as it does in its native lands. The sort with which we are most familiar is known as the English Ivy. It grows wild in the deciduous woods of England; also in temperate Europe generally. The Irish Ivy is but a vigorous and large-leaved form of the English Ivy—not a native of Ireland at all, but of the Canary Islands. Ivies are found wild in Europe, Asia and Africa, but none in America. Besides these two kinds, there are many beautiful garden varieties of them. Some have large entire leaves; others small and deeply-cut or lobed foliage; the leaves of some are margined with white or yellow, and others are blotched and clouded with the same. In some cases the silvery variegation assumes a reddish or bronzy tinge towards the Fall; but in most instances the variegation lessens, as is the case with the variegated forms of Day Lilies and Meadow Sweet, as the season advances.

The ivy is generally used to cover north-facing or shaded walls, also rocks, blocks or pillars in cool, moist, shady places, stems of naked trees and sometimes fences, likewise to form carpets under trees and belts upon the lawns. At one time it was popular for cemetery work, to cover the base of monuments, make a bed-mat over graves, and form a narrow belt around the lots; but since some years it has been less used, the Japanese Ivy having usurped its place as a "vine," and the periwinkle, or "myrtle," as it is often called, as a ground mat. But the ivy is not reliably hardy in the Northern States; we sometimes see it for years in thrift and vigor, even keeping pace with European luxuriance; then comes an exceptional Winter like the last, and the ivy is either killed or badly injured. That which spreads upon the ground may be saved in Winter by being covered over with spruce boughs, straw or tree leaves.

But it is as a house plant that the ivy is esteemed. Grown in a pot, tin can or wooden box, in open, rich soil, it will thrive in the darkest window, where most other plants would perish; we train it up the window sides, along the ceiling, around the picture frames or elsewhere at our pleasure, and still the leaves will keep their deep and glossy green, and shoots will break out and grow. Or we can snugly keep it as a "specimen," and train the shoots around a trellis or on some stakes in pyramidal, fan or cushion fashion; or we may let it grow at pleasure and shorten back the growths to render them more numerous, and in this way depend in folds over the vase's side, or like a mantle from the box that sitteth on the window sill. It is an excellent city plant; the darkness of the streets or smoky atmosphere affects it little. It may be safely lodged in shed or cellar in the Winter, providing that the temperature be moderately low, the atmosphere not parchingly dry—as near a furnace—and that the soil it grows in is never quite dry. But it will bear a deal of heat, as well as cold, providing the atmosphere is moist and the roots are watered well.

It is propagated by means of cuttings or slips at any time, grafting the rarer sorts upon the common, and by seeds. Cuttings yield *facsimiles* of the parents; seedlings usually incline to the species more than the variety, and grafting is an evil rather than a good, except in such cases as when we wish to invigorate the weak. Some folks strike their ivies, as they do their oleanders, in bottles of water. Of course the plants root readily, but the roots lack substance, and are not likely to be transferred from the water to the soil with safety. This method of "water-cuttings" is a miserable practice.

A great many kinds of plain-and variegated-leaved ivies are advertised by our nurserymen and florists at 25 to 50 cents apiece. The subject of the accompanying illustration, namely, Hedera Helix Madeiriensis variegata, or, in other words, the Variegated Madeira Ivy—be sure you do not confound this ivy with the Madeira Vine so common in our gardens, and which is not an ivy at all—is a new sort raised in England, where it was exhibited for the first time last year. The Gardeners' Chronicle, from which our picture is re-engraved, says:—

"It is a very handsome, large-leaved, silvery variegated plant, perfectly hardy in constitution and very free-growing, and has, moreover, the quality, often wanted in variegated ivies, of retaining its variegation throughout the season."

Miscellaneous.

RURAL BRIEFLETS.

WHERE the grasses of meadows are of mixed kinds it is better to cut when the earliest is in bloom, than to wait until the latest is in bloom, unless the last constitutes a large per-

VARIEGATED MADEIRA IVY.—FIG. 328.

centage of the entire field. If any rule could be given, clover should be cut when one-half the heads are in bloom or before any seed begins to form. Many farmers seem indifferent to the very important fact that seed-forming may exhaust the roots of perennial plants more than the growth of stem and leaf. It is well known that some annuals, if the flower-buds be cut off, may be changed into biennials. If, however, the seeds are permitted to form, the office of the plant is performed and it dies.....

A LITTLE liquid manure is excellent for young cabbage plants, tomatoes, if the soil is poor, celery, etc. A few shovelfuls fresh from the stable may be placed in a barrel—the barrel filled with water and this used as needed.....

FOR cabbages the land should be well plowed, harrowed, rolled and harrowed until mellow. For garden culture we make the rows three feet apart and set the plants two feet apart. A dibble or round stick, pointed at the end, an inch in diameter is used to make the hole. If the weather is dry the holes should be filled with water several times, the plants then set and the earth pressed firmly about the roots up to the first leaves.....

TREATED in this way, if the plants are freshly taken from the seed-bed and not exposed to the sun and air, the leaves never wilt in the least.....

FOR the cabbage worm it is best to go over the plants occasionally with a sharp-pointed pair of scissors in hand and cut the worms in two. This is a more agreeable and effectual way of killing them than hand-picking. Later, when the plants head, pyrethrum powder may be used. But this at present is rather costly. Hot water is effectual, but if it is not hot enough the worms escape—and if too hot the plants are injured.....

IT will be observed that in the axil of every grape-vine leaf—that is, between the foot of the leaf stalk and the stem from which it grows—a bud may be seen which at a very early age in the growth of the stem begins its development into a secondary branch or "lateral." If we desire to confine our vines to a single stem, as in the case of young plants, these laterals should be pinched out. In older vines several stems may be permitted to grow—the number depending upon the vigor of the variety and the quantity of fruit which it may safely bear. But each main stem whether one or a dozen should be treated in the same way. The axillary buds should be pinched out as soon as they appear. When the stems have reached the top of the arbor or support, the growing ends should be pinched and the lateral buds may then be permitted to grow near the top in their stead. When the vines are pruned in the Fall all the laterals are cut away, of course, with a part of the main stems, which are left to bear the next season's fruit.....

ONE of our friends in Texas, Wharton Co., says that the "Rural Branching Sorghum is looking splendid; plenty of roots with ten and twelve branches. It is far ahead of other sorghums planted side by side with it."

We do hope the Rural Sorghum may not disappoint the expectations our statements regarding it have raised.....

SPEAKING of the hardiness of the beautiful Japan Maples, we find a note in the London Garden from which we make the following paragraph:

"Some consider them tender, but in the Southern half of this country and all Ireland they have withstood our late severe Winters unhurt, and if a shrub can withstand such cold as that we have of late experienced, it surely ought to be ranked as hardy."

The request we made in the RURAL has brought us a number of responses and the upshot of them all is that they cannot, in this country, be considered hardy enough to endure our exceptional Winters.....

SEVERAL fine heads of Clawson Wheat received from M. B. McLouth, of Lenawee Co., Michigan, show that there can be scarcely any difference between the blooming of this variety there and at the Rural Farm.....

WE would again remark to our friends that those sending heads of wheat to the RURAL NEW-YORKER in competition for the prizes offered should be careful to write their full address on the box, which is now permitted by the postal laws. Otherwise we cannot always place the wheat sent with the letter of the person who sends it.....

PROF. BLOUNT of Colorado says that some of his wheats already show 80 good heads from one kernel.....

HERE seems to be a new if not an excellent idea sent to the RURAL by Mr. D. S. Marvin:

"If Hanson Lettuce be sown with clover early in the Spring it grows far more tender than if sown by itself; the shade afforded by the clover keeps it from heading, or forces it to remain fresh and succulent for a long time after that grown in the full sun exposure is unfit for the table. This hint came out of an accident.....

MR. MARVIN also says:

"The prospect for a grape crop in Jefferson Co., N. Y. never was better. I am now busy hybridizing and crossing more carefully than ever before. The Eumelan is a grand mother. I use it as one of the factors in most of my experiments and I never use foreign pollen; if I cannot get as good grapes from our natives as from Vitis vinifera I am greatly deceived. I am sorry to see your corn prospects are so poor; I am glad to see you are crossing our wheats.

.....

AGAIN, Mr. Marvin offers a problem for paper-bag manufacturers to solve:

"It is fairly proven that paper bags made of good manilla paper to cover the clusters of grapes while ripening, afford an excellent protection against mildew, birds and insects. Personal observation and experience have demonstrated their usefulness against human marauders or fruit thieves, *provided green bags* of the same tint as the foliage of the grape are used. But I find difficulty in getting good bags; the hot sunshine and rain fade out all the ordinary shades of green that I have been able to procure. I have applied to several manufacturers to have them made, but have failed so far to obtain a permanent green. I would therefore call the attention of our manufacturers to this want and feel sure that such an article would find ready sale."

PROF. BUDD, of the Iowa State College, writes us that he is engaged in a special work, viz., that of trying to adapt—by selection and importation—fruits, shrubs and trees to the peculiar climate of the prairie States. In some respects the climate of Iowa is more trying than that referred to by Hoskins and Chas. Gibb in the RURAL, as the "Cold North." The dry air and intense heat of the Iowa Summers they know nothing of. Iowa Winters are not only cold, but the west and northwest winds are dry. The steppes of Northern Europe and Asia have what is wanted and the Iowa State College has many of their fruits, shrubs and trees under trial .....

KILLING POTATO BEETLES.—The RURAL is usually very correct in giving information, but on page 402 in answer to the question, "How are the potato beetles, etc.," I find it making the assertion that the old ones cannot be killed by poison. Now "the fact is" they can and have been killed in vast numbers by London-purple and Paris-green. If the poison had been applied at the time the pests were eating the young shoots the result would have been satisfactory. I always watch for the time when they are eating and dose them at once, and never fail to kill a great many. This season they were unusually numerous and we killed so many that three days afterwards they would not average a bug to ten hills. No amount of hand-picking would have been so effectual. The young are just beginning to appear on the vines, the cold weather having kept them back. A. E.

Cambridge, N. Y.

REMARK.—Our friend misunderstood us. The old beetles were so numerous this year that they eat the sprouts as soon as they appeared, so that there was nothing to apply the poison to.—EDS.

Mr. T. J. Bull, of Hot Springs, Ark., informs A. J. C., of Salt Lake, that upon the receipt of stamps for postage he will, in the Fall, send whortleberry plants.

What Others Say.

A STRIKING illustration of the value of work as an educator has been recently furnished by Rev. Washington Gladden, of Springfield, says Prof. Northrup. He sent a circular to 100 of the most prominent men of that place, asking, "Was your home during the first 15 years of your life on the farm or in the city, and were you then accustomed to work when not in school?" Of the 88 who replied, five only "had nothing particular to do," while 94 per cent. were farmers' sons, or hard-working boys. So everywhere, as he clearly shows, the prizes of life are carried off by the men who learned to work.

SPEAKING of cabbages, Mr. Joseph Harris says:—Fotler's Drumhead, Stone Mason and Premium Flat Dutch are all excellent varieties. The Drumhead Savoy is a delicious cabbage with wrinkled or curled leaves, and should have a place in every garden. The Winningstadt is not as large as the others I have named, but is sure to head. If your land is not rich or not in the best condition, and if you are late in planting, the Winningstadt offers the best chance for success. It often gives good solid heads where the larger and later kinds fail. It is, moreover, a delicious cabbage. Many growers, especially on light, sandy soil, prefer it to the later and larger varieties, as it can be planted thicker, and you get more cabbage per acre.

THIS year Mr. Harris sets out his own crop in rows two and a-half feet each way. This gives 6,969 plants on an acre. Some prefer to make the rows two and a-half feet one way and two feet the other way. This gives 8,712 plants per acre.

THE difference of price between early-cut and well-cured hay, and the late and poorly cured, is fully 25 per cent., and this is no more than the actual difference in value for feeding stock. Now, to lose one-quarter of the value of a crop through some error of judgment, or carelessness in gathering, is far more than any

farmer can afford, and we appeal to those who have suffered from such losses if it is not time that they were stopped.

WHEN TO CUT GRASS.—The Sun remarks that grass left standing until the seeds are fully developed may contain as much nutriment as when in a greener and more succulent stage, but the nutritive qualities are not available, and a large portion must pass the animal as indigestible matter, and this is why our best and most thorough farmers claim that grass when cut in full bloom makes sweeter and better hay than if left until the flowers have fallen. This is, no doubt, correct, for at the stage named grass contains all the valuable properties required in hay that it will ever have, and nothing is gained by allowing it to stand longer. The maturing and ripening of seed is what may be considered an exhausting process, and the roots of grasses are weakened more by the ripening of one crop of seed than of two crops of hay cut while the plants are in bloom.

IN this country, says the London Live Stock Journal, the Herefords have long been considered the best beef-makers, but their reputation for milk is not yet established. It is claimed that they fatten quicker, and that their flesh is better than is the case with Short-horns, but the Short-horns have a superior reputation for milk. The English farmer looks for the highest practical combination of flesh and milk in his dairy cattle, and few will doubt that the Short-horns supply this condition more satisfactorily than any other breed.

ACCORDING to Le Parlement, the people of Paris have been eating "new" potatoes for some time past. The manufacture is achieved in the simplest possible manner. A selection is made of small old tubers, which are subjected to a good scrubbing in water, till the outer skin is completely rubbed off and the second skin exposed. This skin is clear and shining, and gives the tubers the appearance of new potatoes freshly dug.

BEFORE starting for a long day's fishing, rub a little soap on the ferules of your rod.—Exchange. Be sure to put $2 in your pocket—for fish.—Detroit Free Press. . . . . The house-fly can only see a distance of thirty-eight feet, but that never bothers him any. He always manages to keep within thirty-seven feet of everything.—Detroit Free Press. . . . . The man who knows you well may forget all about you when you are sick. . . . . Sometimes a noble failure serves the world as faithfully as a distinguished success.—Dryden. Did he refer to our next corn crop? . . . . The person who eats oleomargarine is sure to get fat—of course. . . . . Anybody who aids in driving from our markets the Wilson strawberry, that acid and deluding product of commerce which for so many years has been an affront to the popular palate, is a public benefactor.—Tribune. The man who can produce a berry as hardy and prolific as the Wilson, and differing from it in having the flavor of a strawberry and not of a crab apple will make his everlasting fortune. . . . . The farmers of Illinois are very much excited about the depredations of the Hessian fly, and want to know something of its origin. If we mistake not, it was General Washington who first made the Hessian fly in this country.—Yonker's Gazette. . . . . The chief aim of the industries of life, whether agricultural, manufacturing or commercial, and the great end for which government itself is worthy to be maintained, says B. G. Northrup, is that men may live in happy homes. "The hope of America is the homes of America." . . . . . And the following is from Puck. One should live at the Rural Farm and have wheats to cross in order to fully appreciate the last lines:

Now come the pleasant days
When in the woodland ways
The happy zephyr plays
With the rose,
And on the starry nights
The "skeeter," full of bites,
With keenest rapture lights
On your nose.

There is more eloquence in the gift of a dollar to a starving family than in the most charming sermon that was ever preached on the subject of charity. . . . . The man who can sit alone for half an hour with his own conscience and feel that he has been in respectable company is fit to join any church in the land.

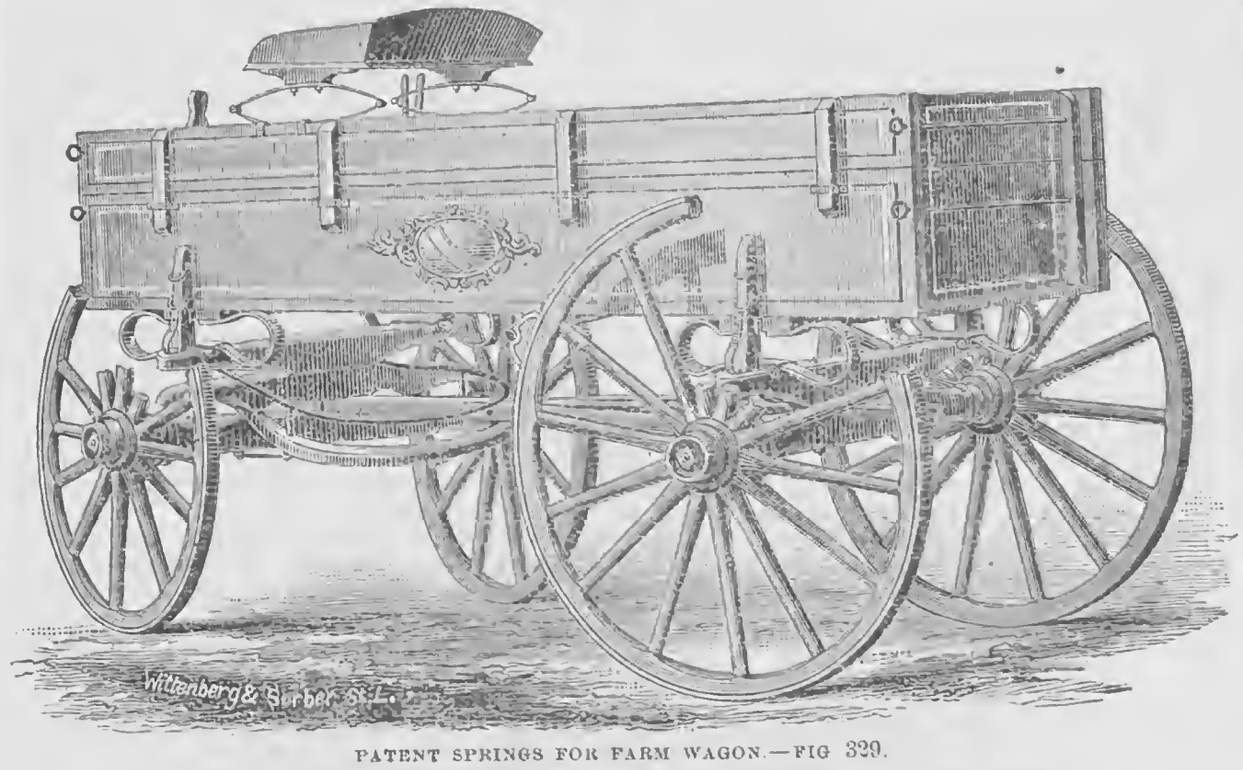
Industrial Implements.

STAR CANE MILL.

Special attention is called to the Star Cane Mill, manufactured by J. A. Field & Co., of St. Louis, Mo. Among the many points of excellence of these mills, we notice the novel feature by means of which, by the removing of one screw the scraper, or feed guide that guides the cane in the center of the mill, can be removed and repaired without taking the mill apart. The journal boxes can also be removed without taking the mill apart, simply by unscrewing one nut. These features are new as combined in a mill. The advantage derived from these improvements will be appreciated in case of the breakage or the wearing of the boxes. They also afford a quick and speedy remedy in case the mill becomes clogged between the rollers. The great advantage claimed is in overcoming the difficulty caused by broken particles of cane stock lodging on the inside of the mill. These particles while they may not cause any difficulty in the operation of the mill, if left over-night will sour and spoil the first lot of next day's grinding. By removing the scraper or feed guide, the mill can be washed, all these particles removed and the mill kept clean and sweet. One of the best evidences of their real merit is their rapidly growing popularity and the increasing demand for them from every State in the Union and from foreign countries. This firm also make evaporators and a full line of sugar makers' supplies. They publish a treatise on the planting, cultivating and manufacture of sugar cane, which they furnish free. K.

PULLIAM'S PATENT BOLSTER SPRINGS FOR FARM WAGONS.

THE wagon springs under Pulliam's patent are made by the well and favorably known Semple & Birge M'f'g Co., of St. Louis, Mo. The saddle or yoke of the spring is made of the best malleable iron, and every leaf of the spring, before leaving the shop, is tested under steam pressure by bringing the two points of the leaf together six times, and if the steel remains bent or shows the least flaw it is thrown into the scrap pile. The great point gained by the excellent construction of these springs is that they carry the load with an easy springing motion, thus saving largely in the wear and tear of every part of the wagon by relieving it from sudden shocks caused by uneven roads. With their use the draft is found to be lighter than with ordinary wagons, and while the team is saved a good deal from being galled by the harness, the latter is saved not a little by freedom from sudden jerks and irregular strains. These springs convert a common lumber wagon into a spring wagon, and are admirably adapted for farm wagons in that they prevent or greatly lessen injury to eggs, butter, honey, milk, cheese, dressed poultry, fruits and vegetables, by shaking and jolting. The saving by the use of these springs in hauling a couple of loads of farm products to market often doubtless might pay for a full set. Four different kinds of springs are made varying in strength in accordance with the weight of the load they are to bear, and ranging in price from $12 to $15 for sets of four. Full directions for the manner of using the springs are furnished by the manufacturers. G. B. B.



PATENT SPRINGS FOR FARM WAGON.—FIG 329.

Scientific and Useful.

FERTILIZER ANALYSES.

The following analyses have been made for the New York State Agricultural Society, by W. M. Habirshaw, F. C. S., chemist to the Society:

1 Dissolved bones, manufactured by Bradley & Co., Boston, Mass.; sold April 16 1881, to Thomas Fisher, Skaneateles, N Y.; by P. J. Cogswell, Rochester, N. Y.; $33 per ton; sampled May 5; analyzed May 31.

2 Superphosphate, manufactured by L. L. Crocker, Buffalo, N. Y; sold by N. M. Curtis, Ogdensburgh, to T. L. Harison, Morley, N. Y.; $40 per ton; sampled May 19; analyzed May 31.

3. Americus fertilizer, manufactured by Clark & Co., New York; sold May 12, 1881 by J, E. Phelps, East Hampton, Mass., to S. B. Fanning, Franklinville, N. Y.; $48 per ton; analyzed June 14

4. Stockbridge potato fertilizer, sold April 6, 1881, by Gildersleeve & Bro., Mattituck, N. Y., to —— Wells; $50 per ton; analyzed June 14.

5 Potato fertilizer, manufactured by G. W. Ralston. 158 Front St, New York; sold by Isaac Reeve, Franklinville, N. Y., to C. W. Ferry, May 17, 1881; analyzed June 14.

6 Potato fertilizer, manufactured by the Mapes Formula Co., New York; sold May 1881 by A. Burt, agent to A. Young, Franklinville, N. Y; $51 per ton; analyzed June 14.

7. Slade's fertilizer; sold by J. B. Slade, Riverhead, May 7 1881, to John Ferry, Franklinville, N. Y.; $35 per ton: analyzed June 14.

8. German potash salt; sold May 9, 1881, by J. E Phelps, East Hampton, Mass., to S. B. Fanning, Franklinville, N. P.; $14 per ton; analyzed June 14.

9 German potash salt; sold March 28, 1881, by the Mapes Formula Co., New York, to Charles Reeve, Mattituck, N. Y.; $14 per ton; analyzed June 14

Everywhere.

RURAL SPECIAL REPORTS.

Arkansas.

PALESTINE, St. Francis Co., June 24.—Small grains are scarcely known here as crops, with the exception of oats; very little of that sown. Corn will be about an average crop, probably rather less than usual. Scarcely any attention at all is paid to small fruits, and there are but few orchards deserving the name. G. B. B.

California.

CEDARVILLE, Modoc Co., June 23. — Our Winter was very mild—very little snow, but a great deal of rain. Winter barley and Volunteer wheat are looking splendid. Crops of all kinds are in a flourishing condition; there will be a much larger yield than for many years. The acreage, too, is much larger than in any previous year. Wheat, barley and hay are our principal crops. Corn is a failure in this section; we plant but very little; frost kills it before it is ripe. Orchards are looking well and small fruits are abundant. C. B.

LAKE COUNTY.—Many places on the Pacific Shore derive their names from their relation to, or connection with, surrounding circumstances. Thus, Nevada means snowy; Petaluma, means duck hills; Lake County derives its name from Clear Lake, a translucent body of water 80 miles in length and 16 miles in width. So far as the raising of wheat, oats, barley and rye is concerned, the valley lands of California are generally good, at least in the northern part of the State. Some sections far exceed this in the quantity of yield, but none exceeds it in the quality. Wheat, barley and oats are our chief small grain crops. Chilli, Club and Propo wheats are the favorite sorts in the valleys. In my immediate section there are probably about 5,000 acres sown to small grains. Corn does not do well here, though the amount cultivated from year to year is continually on the increase. Orchards and small fruits do very well in almost every section of the State. The vintage of the State has taken a new impetus within the past two years—the natural consequence of a partial failure of the grapes in some of the old countries. This county has attracted the attention of viticulturists from the Old World, and I can safely say that nearly 500,000 cuttings have been set here during the past season. Should this branch of business succeed as well as some predict a new life will doubtless be manifest in this part of the State. W. R. C.

Colorado.

LONGMONT, Boulder Co.—The acreage of wheat is much larger this year than heretofore, and the outlook for a large crop at this time is good. Some pieces are burnt a little, owing to a scarcity of water for irrigation during the past week, but the ditches are full again and the danger is past. Oats, barley and corn look as well as wheat. For every 100 acres of wheat there are 15 of corn, 10 to 15 of barley and three to five of oats. Winter wheat, Early May; Spring wheat, White Siberian, White Sonora, Oregon Club, Chillian and Blue Stem. The two-rowed barley takes the lead. Oats, black and white. Corn, yellow dent and White Mexican. Our corn crop is gradually increasing year by year. Fruit trees were badly killed during last Winter. Small fruits appear to be doing well. We are only beginning to set out fruit. Ten years ago there was not one man in a hundred who thought that fruit could be raised here. Now there is hardly a man who has not more or less fruit started. Eight years ago the country where I now live was a barren waste. A. M. P.

Dakota.

ASHTON, Pink Co.—About 3,000 acres of wheat were sown in this county, and the outlook is promising—Scotch Fife and Lost Nation. Oats a fair average in acreage and outlook. Very little rye, and a good deal of flax; a good prospect for both. The outlook for corn is poor—season too late; a much larger acreage than ever before. This county is too new yet to have much orchard or small fruits. C. W. A.

SIOUX FALLS, Minnehaha Co., June 22.—The cultivated acreage is about the same this year as last. Wheat, oats, flax and barley are chiefly sown. The prospects for corn are poor, owing to so much rain in Spring. No orchard or small fruits of any account are raised here. E. E. S.

Kansas.

NEWTON, Harvy Co.—Outlook for wheat somewhat better than last year; acreage about

five per cent. larger—chiefly Turkey, Fultz, Red May, and Alabama May. Oats are good; fifty per cent. better than last year; acreage not so large. Prospect for corn first-rate and acreage larger than last year's. If the season continues as at present we shall have an immense crop. Orchards, though young, are doing extra well; we shall have some apples, some pears and a good crop of peaches. Strawberries and gooseberries are plentiful and good; blackberries and raspberries mostly winter-killed. Potatoes are doing finely; in fact, Early Rose are already in use. Garden vegetables are late but doing very well. J. S. G.

PARSONS, Labette Co, June 23.—Harvest secured. Wheat averages five bushels of No. 4 Winter. Oats better than usual. Corn has been growing first-rate under a hot drought. Till last night all districts in the corn belt have had rain enough, and didn't we get it last night! Another rain like this in the middle of July, and Kansas promises, as in 1869, to beat the world of corn. J. B.

URBANA, Neosho Co., June 24.—Ten per cent. more wheat was sown than last year; but it will not be half a crop—Lima, Fultz and a nameless bearded sort. Oats a fair crop; rye good, but only a little sown. Corn prospect good. Apples and pears scarce. Small fruits plentiful. J. M. A.

Louisiana.

LOGTOWN, Ouachita Parish, June 24.—No small grains, except oats, are sown in this parish, and these only in small patches for the purpose of feeding green to our work-stock in cultivating our staples, corn and cotton. The planters usually sow what are called rust-proof oats, and generally find that our heavy dews, followed by hot suns, impair the reputation implied by this name. Our lands in the river bottoms are altogether too rich for small grains, producing large straw and no seed. Fully as great an acreage of corn (if not greater) has been planted as last year, and yet the present prospect is that we shall not harvest nearly as much. This Spring was very backward and unfavorable for pitching our crops. The 1st to the 10th of March usually finds the bulk of the corn planted. This year it was not finished by the corresponding dates in April. Cotton planting was, therefore, necessarily quite late, made so in part by continued rains, and planters have "been rushed" to get their cotton in and cleaned and brought to a stand, even to the neglect, to some extent, of the working of the corn crop. In fact, we are *greatly in the grass*, and shall be for some days. To add to our troubles, the seventeen-year locusts, as they are called, have destroyed much of the cotton already chopped out, by depositing their eggs in the stalk, which necessitates extensive replanting in this section, and I am unable to state to what extent the damage has been done throughout the parish, but I suppose that their ravages are general. The frost of the night of April 1st last was disastrous to our entire fruit crop, including apples, pears, plums, quinces, pomegranates, figs and peaches. The last mentioned were generally killed, with now and then an exception in a sheltered situation; but even the fruit which has matured is faulty and without flavor. This remark applies to the hardier as well as to the more tender kinds. Of late years our people have paid much attention to the cultivation of all kinds of fruit, both small fruits, so-called, and those cultivated in your latitude, with the exception of cherries, currants and gooseberries, to which the climate is not adapted. The loss makes a fearful deduction from the sum total of home comforts. Our section is particularly favorable to the cultivation of strawberries, raspberries, blackberries, grapes and and peaches. Our strawberry season commences generally about the middle of March and continue, to the middle of May or first of June. With a judicious selection of varieties with reference to succession and the power of the later varieties to resist the effects of heat, it is quite possible that two or three months more might be added to the Southern strawberry season. Suppose some of your Northern nurserymen and cultivators should attempt the solution of the problem. F. A. H.

Maine.

PORTLAND, Cumberland Co., June 24.—We have had a very backward season, but wheat, oats, barley, rye, etc., are looking well; acreage about the same as last year. The variety of wheat chiefly sown is Lost Nation. The prospect for corn is not very good owing to the cold weather we have been having. The acreage is very much larger than last year. The prospect for orchard fruits is very promising for the "off" year. There are not many of the small fruits grown in this section except strawberries which promise well, although the grub worms are more numerous than they have ever been, and are destroying many plants. J. W. A.

Maryland.

EASTON, Talbot Co.—The usual acreages of wheat and oats. No barley, or rye of any amount. Wheat, mostly Fultz and Mediterranean The prospect for corn is only medium, with the usual acreage planted; will compare favorably with last year. The peach and apple crops are only about one-third of what they were last year, some large peach orchards, off the water courses, having no fruit at all. Berries a fair crop. A. B. B.

Michigan.

HART, Oceana Co., June 24.—From May 14 to June 13th we had no rain. It became very dry and everything suffered. During the past week we have had several good rains and vegetation is beginning to look better. The grass is very poor and pastures were much withered. Fodder for next Winter promises to be scarce and farmers are selling off their young stock. Two-year-olds bring from $20 to $25. Those who mulched their strawberry beds or have had a chance to irrigate them, will have a good yield of this fruit. It is surprising how much water this berry will take while growing. Having a brook that I could turn on to my bed, I have had a chance to see its wonderful capacity for moisture. Both the foliage and fruit show the benefit derived and no signs of the dry weather. This Spring, some of our farmers had again to learn the lesson, "never to hold on to a crop when you can get a good paying price for it." Potatoes were at 80c. to 90c and dropped suddenly to 50c and then lower. One man, after drawing a full load to town, refused 80c., for he felt sure of a dollar in a few days, and so stored them in a cellar. He has since sold them to the same man for 15c. per bushel. Some have began cutting clover. From the looks of most fields one would judge our farmers have yet to learn when to begin haying. Too much is lost by delays. A. H. B.

PETOSKEY, Emmet Co.—Ours is a new country; six years since it was covered by an unbroken wilderness at which time it was first thrown open to settlement and although the land has all been taken, much yet remains uncultivated, their being yet but from ten to one hundred acres cleared on each quarter section; soil, deep sandy loam. The acreage sown and planted is increasing from year to year. Wheat, with few exceptions, promises a good yield, as do oats and peas. Winter wheat, Fultz, Clawson and Diehl; Spring wheat, White Russian. Rye but little grown; what I have seen looks poorly. As much corn as usual was planted and it promises well. Small fruits in abundance.; I have never seen any section produce them more plentifully. Our young orchards of apples, pears, cherries and plums look well; but are not bearing much yet. Most of our peach trees were killed by the unusual cold of the past Winter. Hay will be a good crop. J. R.

Minnesota.

ZUMBROTA, Goodhue Co.—There is an increased acreage from last year of barley and corn. Oats about the same, and a consequent decrease in wheat. All look well except barley, which is very unpromising. Wheat, Scotch Fife and Rio Grande principally; oats, Surprise, Norway and White Dutch. Acreage of corn increased about one-half; looks well, but weather is rather too cold. Fruit prospects good; strawberries in abundance; currants not very good; bushes filled, but dropped off badly. T. M.

Mississippi.

TYRO, Tate Co., June 24.—Wheat acreage not more than one-fourth of an average owing to a wet Fall and Winter—Red May. Oats an average acreage; yield good. Schey's Red Rust-proof. German millet acreage double; yield, early, very large; late looks well. Corn acreage one-twentieth less than usual, with less than an average yield per acre. Cotton acreage increased 30 per cent.; rather late and low, but better formed and in better condition than last year. Orchards are generally young and not bearing. Small fruits almost an entire failure. M. M. M. T.

Missouri.

DE WITT, Carroll Co., June 26. — Wheat will be about half a crop. A great deal of it was winter-killed. I think one-third of it was plowed up and put in corn; there was a larger acreage sown last Fall than usual. No Spring wheat. The early-sown wheat stood the Winter best, and is ready for harvest now; the late-sown the chinch bug is damaging. Fultz is the leading variety and some Clawson, May, and Gennessee, and some Odessa. The prospect for oats is better than it has been for years: about the same acreage as last year. No barley; very little rye—good. The prospect of corn is good; about the same acreage as last year. Some of it is late, but all looks well. Apples half a crop; peaches all killed; small fruit, good. My Cuthbert Raspberry from the RURAL NEW-YORKER is full of fruit. C. R.

CHAMBERSVILLE, Dade Co., June 25.—Wheat acreage 10 per cent greater than last year's; average, 50 to 75 per cent. of last year's yield. Mediterranean, Egyptian, Walker, Fultz, in the order named. Corn generally a poor stand; much replanting; chinch bugs and a web-worm—similar in its operations to the army worm—are taking whole fields. Small fruits hardly any but gooseberries. No peaches to speak of, and not more than apples enough to supply the home demand. J. H. H.

GUNN CITY, Cass Co.—Wheat very fine—more than average crop. Flax and corn growing nicely. Apples, peaches and cherries average crops. T. J. Z.

RICH HILL, Bates Co.—The acreage of wheat is 50 per cent. more than last year; still the yield will not be more than half an average crop—Fultz and Mediterrancan mostly. Not much oats sown—very short. The outlook for corn is good and the acreage 25 per cent. more than last year's. Fruits of all kinds are very short crops except gooseberries which will be a full crop. G. R. S.

Nebraska.

BRAINARD, Butler Co., June 25 —Wheat on old ground, weedy; prospect for crop not so good as earlier but it is improving in appearance from the last week. Rye but little grown; looking well. Oats not much grown, weedy. Corn, late, and weedy, but with the present favorable weather it is improving. Farmers are busy working it and with a favorable season a good crop may be expected. All crops are late on account of continued wet weather and the cold Spring. About the usual acreage of crops. H. J. A.

MISSION CREEK, Pawnee Co. June 24 –Acreage for wheat, rye and oats larger than usual; and rye prospect very good: wheat moderate. Grass and Tea wheats mostly. Prospects for corn good; acreage larger than last year. Outlook for small fruit very good—orchard fruit only moderate. M. M.

ORLEANS, Harlan Co.—A quarter more wheat than last year; looks well; prospect good for a fine crop—Grass Wheat principally. Rye good; but little sown. Of barley none was sown through lack of seed. Corn prospect good; 25 per cent. more planted than last year. Wild grass plentiful; no bearing fruit trees in this neighborhood. D. W.

OXFORD, Furnas Co.—Wheat acreage in advance of any previous year and the prospect for cereals of all kinds good. Odessa and Lancaster wheats. The prospect for corn is good and the acreage is in excess of last year's. What orchards there are, are young, but looking well. Small fruits are doing well. N. A. P.

North Carolina.

COLFAX, Guilford Co.—Wheat is about an average crop here; some smut in places; heads filling well; straw short; acreage a little more than last year. Oats, acreage less than usual; Fall oats winter-killed; about two-thirds of a crop; Spring oats very short on account of drought; prospect for half a crop. No barley; but little rye—average crop. Corn is backward on account of late Spring; acreage about the same as last year. Orchard fruits killed by late freezes; will be from one-fifth to one-fourth of a crop. Small fruits are neglected hereabouts; what there are grown do well. Average crop. R. C. R.

ENFIELD, Halifax Co., June 24.—Oats and wheat are not extensively cultivated in my section, but the yield is not an average, which is about 10 bushels per acre. Corn is looking well but small; average 12 bushels per acre for high land and 50 for low grounds. Cotton, which is a chief product, is small and the stand bad. W. F. D.

Ohio.

GREENFIELD, Mahoning Co.—A report in the RURAL of June 13, says that apples in Ohio are falling off prematurely. Here in the Eastern part of the State, however, the outlook is good for a fine crop. For the past three years we have had plenty and to spare and the promises this year are equally good. Peaches will be plentiful and so will other sorts of fruit. Field crops also promise well. Though wheat is not quite equal to last year's crop, still it is good, though rusting somewhat. Many farmers cannot "work" their corn properly owing to too much wet. Oats and hay will be heavy crops. Wool is changing hands at 25c. to 40c. Fat sheep bring 4c. to 4½. No fat cattle here; butchers are buying at Chicago. D. B. C.

JOHNSTOWN, Licking Co.—For wheat, oats and rye, prospect is fair; acreage a little short of last year's—Fultz, Gipsey and Mediterranean. Corn prospect good; acreage equal to last year's; irregular on account of bad seeds. Prospect for orchard fruit is poor; for small fruits good. Currant worms are doing much injury to currants and gooseberries. A. P. C.

Virginia.

CLEEK'S MILL, Bath Co., June 25. — The acreage for wheat is over an average. The drought in May damaged the crop badly. We may have an average crop if the remainder of the season is favorable. Oats look well. No barley is raised in this section and not much rye. Corn came up badly; some of that replanted has been destroyed by birds and squirrels. The wet weather has not been favorable for working it thoroughly. Some apples: very few peaches. Will have an average of small fruits. W. R G.

Pennsylvania.

ALLENTOWN, Lehigh Co., June 27.—Wheat is medium; rye very good—a few farms excepted. Corn and oats look very promising—still some farmers had considerable trouble with the cutworm in their corn fields, some fields having been totally destroyed, which of course had to be replanted. Grass is medium. We shall have a fair crop of apples and pears; few cherries; no peaches; berries plentiful. J. J. B.

Washington Territory.

VANCOUVER, Clarke Co., June 22.—Only a small portion of this county is under cultivation, it being yet in its "infancy." Probably more oats than wheat is sown, and there is an increase in the percentage of both of at least 10 per cent. this year over last. No large quantities of rye are grown here. The outlook for crops is very good—better than the average. We have had an unusually fine and growing Spring. White Winter wheat. Corn is not counted among regular crops here, and only small lots are planted, and those few and far between. The nights, as a rule, are too cool for corn to do well, except as a garden crop. Small fruits are very abundant. We had a little too much rain during the first ten days of this month to allow the strawberries to ripen to perfection. Many of mine rotted on the plants. The crops of currants, gooseberries, raspberries, blackberries, etc., is very large and fine. A smaller crop of cherries than usual. Plums, prunes, pears, apples, peaches and quinces are all average crops. All the fruits above named, except quinces, grow remarkably well here. Our cherries, plums and pears cannot be beaten anywhere. Peaches do not do very well here. The contract prices for fuel, forage and straw at the military post here for the year commencing July 1, 1881, are as as follows:—Timothy hay—500,000 lbs.—$11.70 per ton; oats—375,000 lbs.—$1.23 per 100 lbs.; straw—200 000 lbs.—$7 per ton; hard wood—2,300 cords—$4 25 per cord; charcoal—1,500 bushels—9½c. per bushel. Soft wood here, $2 50 per cord. The prices are lower than they were last year, considerably. J. J. B.

Wisconsin.

AVOCA, Iowa Co.—What little wheat lived through the Winter, suffered from two or three weeks of dry weather in May. The crop will be light. Barley is not raised in this vicinity and but little rye. Oats look fairly well. Corn looks about as well as last year at this time, about as much is planted also. Apples will be scarce on account of there being such an abundance last year. Currants, gooseberries, raspberries, etc., will be plentiful. E. A. L.

CHIPPEWA, Chippewa Co., June 24 —The acreage of wheat is about the same as last year. Oats a little more. Barley and rye very little sown. White Russian wheat and white oats. All small grains are looking very well; if no mishap befalls them the yield will be good. The acreage of corn is greater than last year, and it is looking well. Plums, currants and strawberries look well. Apple trees were badly killed last Winter. The prospects for the farmer are encouraging. H. M. T.

DELAVAN, Walworth Co.—Winter wheat almost all winter-killed; Spring wheat—but a little of it sown—looking well and promising a good crop; we raise chiefly the Lost Nation and Grant wheats. Barley is extensively raised; but is rather thin on the ground on account of the dry weather shortly after it was sown. Oats are our principal crop of small grain; early-sown are a big crop; late-sown not so good, but doing nicely since the rain. Corn is king, and is, as a general thing, looking well; rather more than usual planted. It has yielded very heavy crops for the past three years; but I do not look for so heavy a crop this year. Apples will be a small crop; currants, plentiful; strawberries half a crop. R. R. S.

The Querist.

ANSWERS TO CORRESPONDENTS.

"Working" a Small Farm.

J. H. W., New Holland (one of five in the Union), sends the accompanying diagram of his 14-acre farm, and asks how to fence it to the best advantage, and the best way to work it.

ANS.—This is a difficult question to answer, because the method of fencing a farm depends upon so many circumstances. If no stock is kept no interior fences at all are required, and when stock is kept the fences are arranged so as to suit special circumstances. Upon a small farm of 14 acres, as here described, with seven acres of timber, the timber land would provide all the pasture that is required, and no more fence would be needed than one to separate the woodland from the cleared land, with a small paddock near the buildings in which to keep the cows when at home. The manner of working such a small farm is another question that depends upon circumstances. Perhaps to keep 10 or 12 cows upon it, which may be possible under a system of high cultivation and soiling, would be most profitable. One man can very easily farm 14 acres and care for a dozen cows without hiring any labor. By

making butter, $75 a year can be made from each cow, which will perhaps be as great an

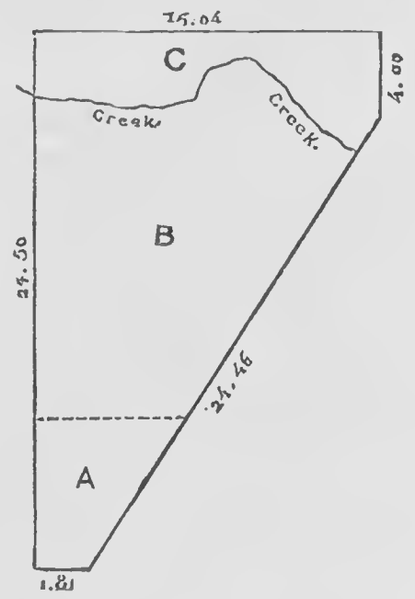

FIG. 330.

income as can possibly be produced from any other method of farming a small tract, with the same amount of labor.

Yellow or Orange Rust on Raspberries and Blackberries.

A. S. M., New York City, sends some specimens of diseased leaves. The malady has destroyed a great deal of his blackberry and raspberry vines, and some of his neighbors have lost all of theirs, and he asks for the cause and a remedy.

ANS.—The leaf inclosed was very badly affected with fungi, commonly known as the yellow or orange rust, which frequently attacks Black Cap Raspberries as well as blackberries. Mr. E. Williams submitted specimens of this fungus, last year, to Mr. J. B. Ellis, of Newfield, N. J., (who is reputed to be an authority on these matters) and he named it "Cæoma (Æcidium) luminatum (Schw. Syn. Am. Bor. No. 2,887), the Uredo luminatum of Curtis's catalogue. It is not properly an Æcidium." The only remedy we know of is cremation. Every infected plant should be dug out and burned as soon as observed. If allowed to ripen, the dust, or spores, will be carried by the air to other plants, thus increasing the trouble. In some sections blackberry culture has had to be abandoned on account of this disease. If some of our Experiment Stations were to employ competent fungologists to make a special study of the fungi that infest our strawberry, raspberry and blackberry plants with a view to find a remedy for these troubles, and if they found it, they would confer a great benefit on the fruit-growing interests of the whole country. Unless science comes to our aid with its close and careful investigation, we shall remain as now, at the mercy of these insidious and destructive diseases.

How to "Soil" Sheep.

W. H. C., Wayandotte, Kansas, intending to "soil" his cows, asks whether a small flock of sheep can also be kept in the same way.

ANS.—The method of soiling sheep is frequently practiced in England and sometimes in this country. It consists in growing such crops as oats, rape, millet, grass, clover, mus-

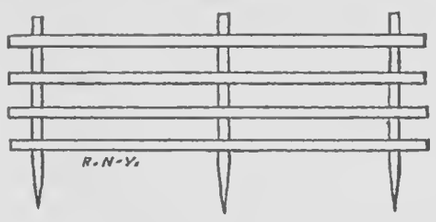

FIG. 331.

tard and corn, and either feeding these from the ground or in racks in small folds or paddocks fenced in by hurdles or movable fences. The fences are made of light panels put together with wrought nails, clinched, and fastened to stakes, which are driven in the ground, as shown at Fig. 331. The ends of the hurdles may overlap and be tied with a piece of tarred twine or fence wire; or the panels may be tied to separate stakes, which are driven into the ground at each end, the ends of two panels being tied to each stake. In laying the fence the plot is divided first by fencing one corner as shown at *a*, Fig. 332. When this plot is eaten off, the cross fence *a* is moved to the line *b*, and when the second quarter is eaten down, the fence is moved to *c*, which serves to confine the sheep on both the other quarters. The fence may then be moved to another paddock, which is fed off while the first is either growing up again or is planted to another crop.

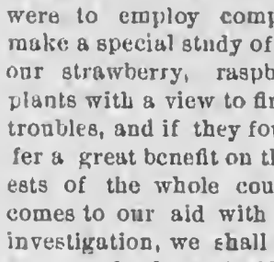

FIG. 332.

Apparatus for Raising Cream in a Cheese Factory.

W. L. L., Palermo, N. Y., asks what apparatus is best for a cheese factory for raising the cream on the milk to make butter.

ANS.—The forms for raising cream in cheese factories and elsewhere which are good and efficient, are numerous, but they differ somewhat in cost and convenience. The plan which is as cheap and convenient and efficient as anything in use consists of two plain tin vats so narrow as to allow the milk to cool through pretty readily—say 10 to 14 inches wide, with the ordinary depth and length of vats for cheese making—set side by side a few inches apart in a wooden vat resembling the wooden envelope for a common make-vat. By filling the wooden vat with water the two tin vats containing the milk will be surrounded with water, and, being narrow, will soon cool through. With these vats refrigeration is generally further aided by passing water through a tin tube placed in the milk just under the cream line. Where vats thus constructed can be elevated enough to allow of spouting the milk from them to the make-vat, they work most satisfactorily. When the milk in them has become reduced to the temperature of the surrounding air they should be covered as nearly air-tight as possible to prevent fouling the cream by condensations from the air on its colder surface. Such an arrangement is very convenient on account of the small space it takes up, and on account of washing, filling, etc., and nothing raises the cream any better.

Starting a Greenhouse.

J. C. M., Mt. Eden, Cal., asks, 1, what would be the probable cost of glazing a greenhouse 10x10 feet; 2, the size, number and probable cost per 100 of the pots required for such a house; 3, would a house of this size be too large for an amateur wishing to grow camellias, azaleas, calceolarias, ferns, etc,

ANS.—1. The cost of glazing here is from one to three cents a light, according to style and quality of work, size of glass, etc. This is for the glazing exclusive of the glass. The price varies a little with the extent of the job. The glass should be bedded. You can thus form an estimate of the cost from the price of labor, glass, etc., at Mt. Eden, which we do not know. You, of course, understand that the glazing is only a single item in the cost of a greenhouse, which many seem to forget. 2 You will need pots varying in size from two to twelve inches in diameter, which will cost from 50 cents to $50 dollars or more a hundred at the East. A hundred each of two, four and six, and fifty each of eight, ten and twelve inches in diameter, will leave you a margin for breakage. You should send to your nearest potter for a catalogue of prices. 3 The size of your house is not too large for an amateur: on the contrary, in a few years you will find it quite too small. It is better, however, to begin in a small way, till you have "learned." All the plants you name are well adapted for a low temperature, except the etc.'s, which may or may not be so.

Miscellaneous.

R. M. D., Holt's Corners, Ill, says that his farm, which he bought a couple of years ago, is, like many others in that neighborhood, so run down by constant wheat cropping for a number of successive years, that now it does not yield more than from 50 to 100 per cent. of what it should yield if fairly rich; and he wishes to know what fertilizer would be likely to return the highest profit for the outlay. A neighboring salt-making establishment is selling the refuse salt for agricultural purposes for a low figure, calling it gypsum, and he asks, 1, whether gypsum is not a species of rock; and, 2, whether this refuse salt would be good for wheat; 3, if so, what is its relative value for wheat as compared with bone dust or land plaster; 4, how much gypsum or salt should be used per acre; 5, if neither is desirable what would be good for the next crop.

ANS.—1. Gypsum is sulphate of lime—salt is chloride of sodium. 2. It might prove of some mechanical benefit. Salt as a manure does not amount to anything; but it aids in rendering the plant food in the soil available. Probably yes. Salt, where needed, strengthens and brightens the straw and increases the yield. 3. We should not advise plaster except experimentally. The three cannot be compared. It should be sown before the land is seeded the same as fertilizers. 4. Six bushels of salt per acre may be sown. 5. It may be that bone flour would suffice. It may be that potash alone would produce a good crop. The safest way would be, in the absence of experiments to test what special fertilizer is needed, supposing you have no farm manure, to purchase "wheat fertilizers" or those specially prepared for wheat by commercial fertilizer establishments. These should be sown in the Fall when the land is prepared for wheat at the rate of from 300 to 700 pounds per acre. If it is desired to seed down, more would be necessary.

W. H. P., Mt. Eaton, Ohio, says: "Last Spring I sent to a New York seedsman for a bushel of Russian White Spring Wheat, which came in due time. I was surprised at the quality, as I expected (according to the circular) to see a nice quality of wheat; but, instead, a poor, shriveled-up, small-grained sort that would not make decent screenings came to hand. I sowed it on good, strong ground, and it came up nicely and looked well until of late, when it stopped growing, and now it looks as though it would never head. I would like you to tell me what is the cause—if it is the climate or the poor quality of seed. 2. What is the best method of selecting and keeping seed corn."

ANS.—1. We have sown shriveled grain on several occasions. We find that the grain from such seed is smaller than the natural size of the variety; but that the heads are longer We should hardly account for the behavior of your wheat as owing to poor or shriveled seed. 2. We are very careful to cure our seed corn thoroughly and to preserve it in a dry room.

W. Y. M., Richmond, Va., asks, 1, whether rye can be sown in corn at the last working—say about July 15—for late Fall pasturing after the corn is harvested, and then to be turned under next Spring—would it be too late. 2. He sends a specimen of a daisy that infests 40 acres of white-oak grove land whose soil is in fair heart, and which has been pastured since the war, when it was fertilized by having been used as a cavalry encampment, and he asks whether Orchard Grass would be likely to overcome the daisies; and, if not, what grass suitable for a permanent pasture would do better; 3, which would be the better means of getting rid of the pest, plowing the land, or thoroughly scarifying the surface without plowing.

ANS.—1. It would not be too early, we should say—we have no great faith in the plan. 2. We should hardly think Orchard Grass would prevail over the Ox-eye Daisy (Leucanthemum vulgare) of which you send a specimen. The Couch or Quitch Grass—sometimes called Rye Grass and Creeping Triticum (Triticum repens), would best answer your purpose, though many object to introducing it upon their farms. It is, however, in dry seasons, easily exterminated by cultivation. The field upon which our 134 bushels of Blount's Corn were raised last year was filled with this grass. There is none in the field now, except along the fences. 3. Decidedly plowing. If this daisy is plowed under when nearly in full bloom, during a hot, dry spell, that is the last of it.

C. A. F., Norwich, N. Y., wishing to get some poultry in which beauty and usefulness are combined, asks which breed would we recommend, and at what price would we furnish a setting of eggs.

ANS.—For your general purpose we recommend the Plymouth Rock. We do not sell anything, and must refer to those who do. The price is from $1.50 to $3 for 13 eggs.

L. E. L., Lee Center, Ill., asks how to manufacture "plug" and "smoking" tobacco without the aid of machinery.

ANS.—A good quality of "plug" tobacco cannot be made from the leaf without the aid of costly machinery, as an immense pressure is required in its manufacture. In order to make salable "smoking" tobacco one should study the process practically in a factory.

No name, Hoosick Falls, N. Y., asks, 1, several questions about cauliflowers, and, 2 what is the best tomato for early forcing.

ANS.—1. We cannot give any information as to this question. 2. Conqueror, Hathaway's Excelsior, Canada Victor are among the best early.

H. B, White Co., Ark., sends diseased leaves and asks the cause of the disease.

ANS.—They are punctured by many small insects, but we cannot ascertain what they are.

P. M., Bridgeport Center, Mich., sends a sample of grass for name.

ANS.—Dactylis glomerata—Orchard Grass—one of the best of grasses.

W. P. D., Mossing Ford, Va, sends two specimens of grass for name.

ANS—Both are Blue Grass—Poa pratensis.

ADDRESS WANTED.—Will A. B. T., whose plan for a house appeared in the RURAL of May 21, please send us his address, as a subscriber wishes to consult with him concerning the house and plan?

A SECOND NATIONAL HORROR.

JUST as the Nation is preparing on this bright gladsome Saturday to celebrate with wonted joy and thankfulness the signing of the Declaration of its Independence, a horror strikes the national heart and conscience such as thrilled the country only once before in its history, when the lightning flashed all over our broad land the news of the horrible tragedy that closed the late conflict. The assassination of President Lincoln it was hoped would be, like the strife that led to it, the solitary horror of its kind in the history of the Union; but alas! the cable has just flashed hither the news of President Garfield's foul assassination. With only the meagerest news of the dreadful fact as we go to press, we can only express our utter abhorrence of the dastardly crime, our regret at such a mournful close of a bright career, and our heartfelt sympathy with the widow and children so sadly and awfully bereaved.

LET US again express the hope that those of the RURAL CLUB to whom the pyrethum seed was sent will tend their plants carefully and save all the seed.

NOTICE TO THOSE SENDING US SPECIMENS OF WHEAT.—Those competing for our wheat premiums will please send the five heads as soon as ripe. Write the address and name of sender upon the parcel or box in order to avoid mistakes.

THE value of feeding substances is a subject of the greatest importance to farmers, but it is by no means studied as it should be. In the article on "Farming for Boys and Girls," (page 462) will be found a list of comparative values of food substances, to which we call the attention of older farmers and those correspondents who so frequently write for special information upon this subject. In the table given will be found all those waste products of which heretofore very little information has been given, but which are of general importance in agriculture.

A WORD OF CAUTION.—It is no uncommon thing in the country to hear of the injurious effects of cold-water drinking in extremely hot weather. Sometimes ice-water is taken to the harvest field which, when drank excessively, as is apt to be the case, is injurious, and even the cold water from the "north side of the well" is harmful. It is better by far to drink moderately cool water frequently, than to take a large quantity when one is very thirsty. Sometimes some such beverage as Ginger Beer or Root Beer satisfies thirst quite as well. Almost every family has its favorite recipe for making "Summer drinks," and we advise them to make use of such during the hot weather.

STACKS of oats if carelessly put together are often destroyed by exposure. Every farmer may know that the heads of bundles—of *every* bundle—should be kept higher than the butts or straw end. But indifferent hands often place the heads lower, or at least on a level with the butts, thus inviting mildew and decay. If oats are to be saved for seed, it is best to wait until they fully ripen before cutting. If the straw and leaves are to be used for food, it is best to cut while the oats are in the dough state and while the leaves and stems are still green. Oat straw so harvested is thought to be very much more nutritious than corn fodder, and nearly equal to Timothy. Many, indeed, cut and house oats the same as hay, and believe it to be fully as valuable.

THE INTERNATIONAL COTTON EXPOSITION.—A telegram from Atlanta Ga., dated June 28, says an important change has been made in the policy of the International Cotton and Industrial Exposition to be held there next October. Director-General Kimball had just returned bringing heavy subscriptions to the Exposition stock from Chicago, Louisville, St. Louis and other cities. These with those already obtained assure the financial safety of the enterprise. Accordingly the Executive Committee voted unanimously to admit desirable exhibits of every kind of industry from all parts of the world without any charge for floor room, the financial outlook justifying this new and important change of programme. The Treasury Department, at Washington, has just issued a circular to Collectors of Cutoms and others in regard to the importation of merchandise to be shown at the Exposition. All exhibits of machinery and other goods from abroad arriving at the ports of Boston, New York, Philadelphia or Beaufort, S. C., will be kept in a part of the Exposition building specially reserved for them, in charge of a custom-house officer. Should the owners or their agents sell any of the foreign goods so bonded, permission for their withdrawal will be given on payment of the assessed import duties, and license to re-export goods not sold will be granted after the close of the Exposition.

THE COMET.

THE appearance of a wandering visitor in the northern heavens is causing much excitement among the "common people" who are anxious to know what good or evil, if either, it portends, and among the astronomers who wish to know when, if ever, it was here last; and when, if ever, it will visit the solar system again. Comets have always caused wonder and excitement and there are a few people still living who are superstitious enough to think that some dreadful event will accompany the comet of 1881. What if it touches the earth? Perhaps we can answer more correctly after such an event takes place, but we don't imagine it will interfere with our terrestrial affairs in the least—since it is now moving away from the Earth's orbit—and if it did, we are quite confident it would get the worst of it. The comet of 1770 got tangled up in the satellites of Jupiter, but they were not affected by it, and after a social visit of four months it bade them adieu.

The point which is perplexing the astronomers now, is to find whether it is a new comet or an old one. This fact will be settled when the nature of the orbit of the comet is ascertained; then if that corresponds with any one of the 300 comet-orbits on record, it may be confidently asserted to be an old one, since no two comets ever travel in exactly the same orbit. The latest conclusions arrived at concerning the orbit of the present comet are that it is quite similar to that of the comet of 1807, though it varies from it a little. The difference however, may be due to some miscalculation, but it is generally considered by astronomers to be a new one. At this writing the comet is computed to be about 43,000,000 miles distant from the Earth. On the whole, its coming was a noteworthy event, as it is probably no ordinary celestial tramp, but gives evidence of belonging to a first-class family of comets, and it will receive as much attention as Donati's of 1858.

THE NEW YORK EX. STATION MIX-UP: HOW IT STANDS.

AT a meeting of the officers of the N. Y. Ex. Station in March, it was decided at once to buy a suitable farm. A committee was appointed to examine and report. It was soon whispered that the Comptroller had better be seen and on calling upon him it was learned that he had doubts of the constitutionality of the appropriation, and that he would submit the question to the Attorney-General. After waiting two months for an answer, a committee called upon him again and found that he had not yet obtained the desired opinion, but he then further said, before a committee of four persons, that he would abide by the opinion when given. Mr. Swan, the president of the Board, then called upon Judge Folger and submitted the law to him, and after careful consideration he said that, although the phraseology of the bill was a little peculiar, he had no doubt of its constitutionality. In a few days the Attorney-General gave an opinion agreeing with Judge Folger's. Gen. Curtis then called upon Comptroller Wadsworth and was told that the opinion had been rendered and it was in favor of the Station. Mr. Curtis at once called a meeting of the board on June 15th. Again an intimation was given to the Board that they had better see the Comptroller, and on calling upon him they were again told that, although these opinions had been rendered, he had consulted his own private lawyer who, had given him an opinion adverse to the bill, and that he should act on his advice and refuse to pay over the money.

A meeting was then held at which the conclusion was arrived at that it was better to try and get an amendment to the law through the Legislature than to try to compel the Comptroller to pay the appropriation by legal means, and accordingly a bill was brought before the Legislature and seems to be in a fair way to pass. These are the facts, but we can't resist the conviction that the politicians have something to do with this action. It seems that they do not mean to let this money be used so as to be of benefit to the farmers unless by some means they themselves can have the *first sucking of the orange.*

We may be wrong in this, but there are many things that force such convictions upon us. Let us hope a law may be passed helping the matter out of its dilemma, but it may be feared when this trouble is settled we may still find something else in the way, for an unwilling mind is usually fruitful in objections.

CROPS AND THE WEATHER.

THE timely rains in late May and early June followed by favorable weather in most parts of the country, have benefited growing crops almost everywhere to an extent that could hardly have been anticipated by the most sanguine, two or three weeks ago. Winter wheat in the northern parts of the region in which it is grown, and Spring wheat everywhere have thriven exceptionally well under those kindly influences. The harvest of Winter wheat is now in full tide in Kansas, Missouri, Kentucky, Virginina, the southern parts of Illinois, Indiana, Ohio, and Maryland, and although the change of weather came too late to greatly help the crop in this belt and south of it, the lastest reports speak considerably better of the outcome than earlier reports did of the outlook. Through most of this region not much over half a crop was anticipated, but the probability now is that there will be nearly 75 per cent. of a full average crop where least was expected, while in Missouri and Kansas the aggregate yield will most likely be over last year's. From most parts of the Northern Spring Wheat region and in nearly all parts of the Winter wheat area reports have wonderfully brightened with the brightening prospect.

Where the crop was most backward and where it suffered most from drought up to the beginning of June and from excessive rains for a short time thereafter, the late improvement is most conspicuous. It must not be supposed, however, that there are no gloomy reports, for there are still very many of them, and from large sections, too, but the general outlook in every State where the wheat has not been harvested, is much—very much—better than it was even three weeks ago. The widespread storms of the past week, while doing much local injury, are not likely greatly to affect the total outcome. It is only a short time since the wheat crop of Ohio was estimated by the observant Secretary of the State Board of Agriculture, at eighteen per cent less than last year's total yield, whereas by the latest report he now puts it at 6,000,000 bushels more. Even in Michigan, Illinois and Northern Indiana where the wheat prospect was the most cheerless, late bright weather has dispersed much of the gloom. Oats, rye, barley, potatoes, corn and all growing crops have also been correspondingly helped by the influences that have done so much for wheat. Great as the improvement has undoubtedly been, however, the most exultant reports come, not from the farms of the country, but from the newspaper offices of the cities.

HOPS AND SKUNKS.

THIS is an age of so-called rehabilitation. It was only the other day Mr. Froude showed the falsity of the general opinion that Henry VIII. was a tyrant and a rather bad husband; another historian proved—conclusively to himself—that Nero was as excellent a man as he was a fiddler; while an essayist demonstrated what a simple-minded, loving, faithful soul was Judas Iscariot. Modern literary research and ingenuity are doing a good deal to pull down the honored and loved characters of olden times and to lift up the despised and abhorred. It has been noticed by sociologists that certain characteristics broadly distinguish all classes of the community in certain ages—the impulse to them is in the air and affects alike the learned and the unlearned, the city-man and the countryman, each manifesting the special peculiarities of his era in reference to his surroundings. Thus the impulse that led the essayist the other day to find virtues in Iscariot, led one of our legislators last week to find merits in the skunk. The genius so deeply imbued with the spirit of his age is Mr. J. Stanley Browne, of Schenevus, Otsego County, New York. So strongly was he convinced of the admirable qualities of the animal that, on June 27, he introduced a bill into the Legislature of this State making it a misdemeanor, punishable by a fine of $10 for each offence, for any person at any time to kill any—well—polecat, or to sell, offer for sale or have in his possession the pelt of such an animal. Afterwards he amended the bill by exempting all the counties in the State, except those interested in hop-growing; for, according to him, every s——k that visits a hop-yard is worth $50 to the owner. A large grub to which the polecat is a destructive enemy, is doing a world of damage to the hop-growing industry of this State. Quitting their holes at night, the skunks visit the hop-yards in search of this pest which they devour "by the millions." The introduction of the bill was met with a storm of ridicule and disapprobation, probably on account of the appositeness of the malodorous subject to the recent conduct of the Legislature. The friend of the skunk, however, persisted, and the bill was referred to the Committee on Agriculture, who reported it favorably. It is to be hoped our legislative Solons will suspend their wrangling long enough to pass this measure for the benefit of the growers of hops and the drinkers of beer, and that others equally imbued with the same spirit of the age will be equally successful in finding virtues in their particular "skunks" as Mr. J. Stanley Browne has been in finding virtues in his.

BREVITIES.

HARVEST over, it will pay us to give good attention to cucumber and other pickles, Lima beans, late sweet corn, tomatoes, turnips, cabbages, watermelons and muskmelons.

WE have just received the following note from a traveling agent who visits all the chief manufacturers of agricultural implements throughout the country: "Your crop reports must have been very accurate, as all the implement men say they correspond with the reports from their agents, and that wherever you report the wheat crop bad, they have had to call in their reapers, etc., and send them to those places where the crops were reported good in the RURAL."

DR. G. B. LORING, our new Commissioner of Agriculture, says he will discontinue ex-Commissioner Le Duc's experiments in tea culture and most of the seed distribution, and devote the main effort of the Department to examination of the agricultural value of government land in the West; to the study of insects pests and of climatic changes; to the collection of careful statistics about agriculture in this and other lands, and especially to forestry which has hitherto been greviously neglected.

OF last year's total wheat crop, amounting to 481,000 000 bushels, it was estimated that 400,000,000 bushels were Winter wheat, and only 81,000,000 bushels, Spring. The Winter wheat crop this year is acknowledged by almost all to be short in acreage and yield; the area of the Spring wheat crop is certainly not larger this year than last, and however excellent the stand may be now, any increase of total yield will hardly counterbalance the decrease in the aggregate of Winter wheat—the vaticinations of many market reporters notwithstanding.

OUR present "Old Probabilities" had better resign! He can't see 24 hours into the future with a double, back-action telescope! One day last week we feared to commence cutting Timothy and clover, on account of the threatening aspect of the clouds. But on arriving at the office we found that the weather report declared "fair and warmer to-day." and "to-morrow the same conditions will prevail," so we telegraphed to the Rural Farm, "Cut." It began raining within an hour! We were "victims of misplaced confidence," and wanted much to sue the "old man" for damages.

THE crop reports from across the Atlantic are still as favorable as last week except those from Great Britain, where the weather has been less propitious. In estimating the probable effect of the European harvest upon prices of American cereals, however, it must be borne in mind that Europe is now living, to a great extent, from hand to mouth, the stock of breadstuffs being unusually low owing to the short crops of last year and the disinclination to pay our prices for our products except under the stress of necessity. This scarcity seems to be greater just now on the Continent than in the United Kingdom, as shipments to the former, contrary to custom, are fully as heavy as those to the latter, and most of the cargoes consigned to "ports of call"—ports to which orders are sent by cable or steamer to await the arrival of sailing vessels—have lately been diverted to Continental ports. Buyers of breadstuffs for the Continent, too, are not limited to such low figures here as are those who purchased for the British markets—John Bull seems to have laid in a fair supply.

Literary Miscellany.

LOST, A BOY.

He went from the old home hearthstone
Just twenty years ago,
A laughing, rollicking fellow,
It would do you good to know;
Since then we have not seen him,
And we say, with a nameless pain,
The boy that we knew and loved so
We shall never see again.

One bearing the name we gave him
Comes home to us to-day.
But this is not the dear fellow
We kissed and sent away.
Tall as the man he calls father,
With a man's look in his face,
Is he who takes by the hearthstone
The lost boy's olden place.

We miss the laugh that made music
Wherever the lost boy went;
This man has a smile most winsome,
His eyes have a grave intent.
We know he is thinking and planning
His way in the world of men,
And we cannot help but love him,
But we long for our boy again

We are proud of this manly fellow
Who comes to take his place,
With hints of the vanished boyhood
In his earnest, thoughtful face;
And yet comes back the longing
For the boy we must henceforth miss,
Whom we sent away from the hearthstone
Forever with a kiss.

MY EXPERIENCE.

CHAPTER I.

"Are you quite comfortable, Gracie?"

"Quite, thank you."

"Shall I close the other window?"

"No, thank you; I prefer having it down."

"Here is your book, little one; I hope it may prove interesting."

So saying my *fiance* hands me a volume he has purchased for me at the book-stall of the station we have just left, and relapses into his own corner, silence and the Times; while I—Grace Armitage, at your service, gentle reader—open "The Story of Elizabeth," and begin to read, turning over the leaves with an appearance of interest I am far from feeling.

It is not that Miss Thackeray's charming novelette fails to attract me. Under ordinary circumstances I should revel in it; but the present are not ordinary circumstances, they are very extraordinary ones, for within the last week I have risen to the dignity of an engaged young lady, and I am not used to it yet. I can scarcely realize even now, when the train is gliding away from Granville Station towards the fair southern country whither we are going, that I am returning home, escorted by my betrothed lover, who is to be introduced to my dear ones at home. When I lift my eyes for a moment from my novel, and glance towards the opposite corner of the railway compartment, which we have all to ourselves (a tete-a-tete we owe to the guard's discrimination), there is a very tangible and substantial proof of the reality of the situation, a proof standing six-feet-two, with dark proud, grave eyes, and a thick, curling, chestnut beard—a proof rejoicing in the very euphonious appellation of Cyril Vernon; a name which I am inclined to think the very prettiest I ever heard.

How Cyril Vernon and Grace Armitage became engaged I am not at all clear about even yet.

About a month—no, it is six weeks—ago I went on a visit to a school friend at Granville, leaving home full of eager anticipation of the pleasure I should have—anticipation which was fully realized. Janie Dutton and I rode and drove, and sang and danced, and were altogether happy for a fortnight, at the end of which time Mr. Vernon came to Granville on a visit.

At first, both Janie and myself were a little afraid of the grave, stately bearded stranger: but soon the fear had faded before his gentle kindness; and when, at the end of three weeks, he took my hands in his and asked me if I could love him well enough to be happy as his wife, I never dreamed of refusing, while my father's consent was easily obtained—Mr. Dutton's warm praise of his son's friend being a most satisfactory recommendation. Thus it happens that I am going home with Cyril, in order that my *fiance* should become known to papa and the family.

We have been engaged a week, although, at my own request, the engagement has been kept secret from all but the Duttons. I have a diamond, solitaire-ring on the fourth finger of my left hand.

Cyril is somewhat grave and reserved in his manner; to me he is gentleness itself, but he never speaks of his affection or seems to look forward to the life we are to spend together; but, then, he is much older than I am, and with him actions speak louder than words.

I am very happy. As the train glides swiftly onward, I say to myself again and again that I am very happy, trying to ignore the undoubted fact that there is in one corner of my heart a little pain which I cannot or will not account for. It is too absurd, when I am the most fortunate girl in all the world, more especially as it is only since we started homewards that this curious little ache has made its appearance. How delightful it will be to see them all at home once more; to tell Mabel and my dear mother how happy I am; to show them all my pretty presents and my handsome, stately lover! I wonder if she will have told anyone of my engagement. I wonder if she has spoken of it to Fannie Edmonds—I wonder if Fannie will have told Jack, her brother—I wonder—and the curious little pain deepens, and I try to dismiss the thoughts of home and bring my mind back to the railway carriage and Cyril.

There he sits, grave, silent, and absorbed in his newspaper. How handsome he is; how grand-looking—much handsomer than John Dampier I say to myself, going back to Miss Thackeray's hero; but then I don't think John Dampier, if he had been traveling alone with Elly Gilmore, would have read the Times. I wonder if Jack Edmonds would read—what nonsense, where are my thoughts wandering to?

I look out of the window: it is a bright, sunshiny, summer day, with a soft breeze stirring among the full-leaved trees, and the birds flying to and fro, chirping merrily and musically. How pretty the old home will look with the roses mingling with clematis over the porch, and the old-fashioned garden in a glory of June blossoms! The children will probably be playing lawn-tennis when we arrive, and Mabel will have tea ready for us in the shady old drawing-room; and after tea I will take Cyril round and introduce him to Miss Baines and Trot the old pony, and show him the swing in the meadow, where Jack Edmonds and I used to have such fun in the old childish days which seem so long ago now.

"Gracie, what are you looking dismal about?" says a deep, rich voice at this juncture; and I turn with a start, to find Cyril watching me over the outstretched sheet of the Times.

"Am I looking dismal?" I ask, trying to laugh.

"I do not feel so."

"And you sighed—such a heavy, sad sigh, little one! What were you sighing for?"

"Did I sigh?" I ask, coloring hotly, and vexed with myself for doing so. "It must have been unconsciously then, for I am quite unaware of having done so."

What is Gracie wishing for that she has not got?"

"Nothing," I answer, steadily.

"Nothing! You are sure, Gracie?"

He looks over at me questioningly and gravely, and I feel that the color flickers in my cheek, and that my eyes fall beneath his.

"You are sure?" he says, gently; and he leans forward, and puts his hand over mine.

"I am quite sure," I answer, steadily.

At this moment I feel that I am indeed a very fortunate girl.

"Then what were you thinking of, dear?" he pursues, smiling.

"I was thinking of Mabel."

He takes his hand off mine, and leans back in his corner.

"About Mabel? You are very fond of Mabel?" he says, quietly.

"Yes, we all love Mabel."

"Do you think Mabel will approve of me?" he says, with a laugh.

I look at him shyly. I have not much fear of Mabel's criticism; and I suppose my eyes say so, for he smiles.

"I hope she will," he says, gaily. "Miss Armitage must be a very formidable personage."

I laugh a little.

"I am Miss Armitage!" I say, saucily.

"You are Miss Armitage!" he repeats, in some surprise. "Why, I thought your sister was much older than you."

"So she is."

"Then how comes it that she is not Miss Armitage?" he asks, curiously.

"Can't you guess?"

He considers for a moment.

"Oh! because she is married, of course," he says, in a tone of relief, as if he has solved a difficult problem.

"She is not married," I announce, triumphantly. "If she had a husband, how could she live with us?"

"He might be abroad, in some unhealthy climate," he suggests, smiling.

"If Mabel had a husband, she would be where he was, unhealthy or not," I answer. "She is much too true and sweet and brave to let him go into danger without her."

"Is she? I am getting curious about Mabel," he rejoins, smiling still, as if my enthusiasm amuses him. "Is she a widow, then?"

"A widow!—oh, no; she has never been married.

"Then why is she not Miss Armitage?" he asks. "I can't guess, Gracie."

"Can't you? Try."

"I give it up," he replies, shaking his head.

"And yet it is very simple. Mabel is mamma's daughter by her first husband," I explain: "and her name is Ord."

"Ord," he repeats; "Mabel Ord."

"Yes; it is a pretty name, is it not?"

He makes no answer, but his lips move as if he were repeating the name.

"Yes," he says presently, "it is a pretty name."

He has taken up the Times, and is completely concealed by its voluminous sheets, nor does he emerge from behind them until we reach home, and I start up announcing that we have arrived at our destination. Cyril puts away his paper and rises; he collects my belongings, and when the train stops, lifts me out in silence on the platform. I see two familiar faces—my brother Bob's and Mabel's beautiful pale face, as she stands, tall, and straight, and slim, in her soft gray draperies. She looks very pale as I hasten towards her, and I think, with a little pang, that I have been very selfish in stopping away so long, and leaving her with all her cares of housekeeping, the parish and the children on her shoulders.

"Welcome home, dear," she says, as she puts her arms round me, while the touch of her lips seem to scorch me, they are so dry and burning.

"Mabel, oh, Mabel!" I say, clinging to her for a moment, but we have no time to say more, for Cyril comes up and stands waiting. I make the introduction shyly enough. Cyril bows gravely. Mabel holds out her hand with a few words of welcome, spoken in low, sweet tones; but apparently he does not see her gesture, for he does not take it or perhaps he has no hand to spare, encumbered as he is with my wraps, etc.

"The pony carriage is waiting," Mabel says, as she turns to leave the station. "Bob will see to the luggage, Mr. Vernon."

We find the pony carriage outside, and Mabel assumes the driving seat; but we have not gone many yards when she puts the reins into my hands.

"You drive, dear," she says, tremulously, and I see that her hands are unsteady and that she is white as death. Cyril is looking at her curiously or anxiously, and I dare say wondering at the strange pallor.

"Mabel, are you ill? What is the matter?" I ask, anxiously.

"There is nothing the matter," she says, almost sharply. "The heat makes me feel a little faint. Is this your first visit to Devonshire, Mr. Vernon?" she adds, looking across at Cyril, who looks somewhat out of place in, and too big for, our little vehicle.

"Yes; it is a lovely county," he answers, and from the cold tone of his voice, I fancy that he has taken some sudden aversion to Mabel.

"We are very proud of it," she answers, in her frank, cordial manner—she seems to have quite thrown off the momentary faintness—"Gracie must take you some long walks and show you our favorite places. There are the most beautiful views to be seen from the hills."

"Have you been here long?" he asks.

"Six years. I dare say Gracie has spoken to you about Easton."

"No; she has not spoken to me about her home"

"I wanted it all to be new to you," I say, as I give the ponies a sharp cut of the whip, thus venting on the poor animals my intense annoyance at the apparent want of sympathy between my lover and Mabel. "I dare say it will look very small to you after New Zealand"

He laughs slightly, and we drive on until we reach our pretty home at the gate of which stands the owner and Jack Edmonds. Papa turns with a start as we pull up, and looks at us in his absent short-sighted way, as if he were not quite sure of our identity; I don't think he is, by the way. Jack evidently recognizes us at once. He raises his straw hat, but does not come forward to meet us; and it is only after papa and Cyril have greeted each other, that I go towards him, offering my hand.

"Is Fannie well?" I ask awkwardly. "And Mrs. Edmonds?"

"They are very well, thank you," he answers, with at least equal awkwardness as he drops my hand, and we stand looking at each other for a moment in silence.

"Come in and have some tea, Edmonds," papa says hospitably.

"Thank you, sir, not this afternoon. My mother will be expecting me."

He lifts his hat again, turns away, and strides off up the hill, and I follow Mabel into the house with that strange pain deepening at my heart.

We reach the drawing-room first, for my father detains Cyril in the garden to show him his favorite Marechal Niel rose, so that Mabel and I have two or three minutes to ourselves before they arrive. As soon as we reach the room, Mabel throws aside her hat, as if the weight oppressed her; then she turns to me, puts both her arms around me, and holds me from her, looking down into my face with such eager, shining eyes!

"You are happy, Gracie?" she says tremulously "You love him?"

"I am very happy," I answer, somewhat untruthfully, and my eyes sink under hers.

"Make him happy, my darling," she says, softly. "His happiness will make yours."

She puts her lips down and kisses me with a feverish, impassioned tenderness; then releases me suddenly, as the door opens to admit papa and Cyril. The next moment her strange agitation has all disappeared, and she is pouring out tea with her usual quiet grace; while Cyril stands, tall, grave, and absent by the window, watching Mabel with anxious intentness, and answering papa in such an abstracted manner, that I am afraid he will not have much opinion of his intelligence; and it is no small relief to me when the dressing-bell disperses us, and sends us off to prepare dinner.—To be continued.

BEAUTIFUL IOWA.

Counties of Sioux, Lyon and Osceola, in the Northwestern Corner of the State.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

STANDING here upon the boundaries of the State, with Minnesota to the north and Dakota Territory to the west we can gaze toward the horizon of the setting sun and truthfully exclaim: "Behold the star of empire is still far beyond, toward the Rockies," for speeding by daily are west-bound trains laden with emigrants, who are seeking government lands and a pioneer's life, while hundreds from our Eastern States are stopping here and settling for a future home. And why not? For we find ourselves surrounded with good society, churches, schools, railroads and thrift. The topography is elevated and undulating, as beautiful as the eye of man e'er rested upon; soil rich, dark and deep, with just enough sand to promote vegetation rapidly and secure good drainage; and thousands of broad acres in these counties, which have been purchased at from $5 to $8 per acre, have this season rolled their rich sod to the sunlight and received a seeding of flax that, with an ordinary yield this Fall, will give a net profit equal to one-quarter the cost of the land. The crop of 1880 for these three counties—80,000 bushels—averaged $1.03 per bushel, while the seeding of 1881 indicates at least 250,000 bushels this season. Lands, wild, according to information from Pierce & Lewis, Orange City, Ia.—who, by the way, publish a neat map of Sioux County for free distribution to their correspondents—are now sold at from $4 to $10 per acre, averaging about $6. They seem to be enterprising and reliable men. Improved farms can be purchased ranging from $8 to $20 per acre, according to location and improvements, which will discount many farms east of the Alleghanies that cannot be bought for less than $75 per acre, in quantity and quality of product. The breaking of this season yields its crop of flax next Fall, and can then be cross-plowed or, if desired, let it lie until Spring before cross-plowing, and it is ready for wheat, oats, corn, rye, barley, flax, root crops, or anything the farmer desires to cultivate.

Lyon and Sioux Counties are bordered on the west by the Big Sioux River, and have four smaller streams coursing through them from north to south, and Osceola County has three streams, all of them abounding in fish. Natural timber skirts most of the streams, and in all these counties there are numerous groves of artificial timber, some of which can yield fuel for fireside use. Wells of excellent water are found at a depth of 15 to 35 feet; and the climate is invigorating and healthful.

Tobacco has been successfully raised here by some enterprising farmers, who brought their industrial habits with them from the land of "wooden nutmegs" and they even ventured to tell us they thought it better "Connecticut Seed Leaf" than they raised "back East." Let the reader look at his map and trace the lines of latitude east, and he will be prepared to believe that this section is adapted by its climate to any produce raised in the Western, Middle and Eastern States. More attention should be given here to setting orchards of choice hardy fruit; and doubtless this will be done in the early future.

We have traveled extensively in these counties, and do not believe there are 160 acres of waste land in the entire area of the three counties, and the variety of surface enhances its value for diversified agriculture, and renders stock-raising and dairying extremely profitable. The natural grasses are as rich and nutritious as they are abundant, and combined with the advantages of pure air, good water, and healthful climate, it is easily understood why the creamery butter of Iowa takes a first rank, and why Iowa beef is at a premium in the grazing season, as well as in the feeding, when the yield of 50 to 60 bushels of corn per acre is turned into beef for domestic and export trade. Not only is it estimated that the stock interest of these counties is increasing fully 50 per cent. in quantity per annum, but effort is continually made to raise the grade and improve the the quality. Short-horns are the favorite breed in cattle; Poland-China and Berkshire hogs; and Cotswold and other coarser grades of wool sheep. Of the latter there are probably 7,000 in these counties, and from D. L. McCausland we were assured that the clip of wool from the same grade of sheep, is fully two pounds more per head here than in the States further east—equal to 33 to 50 per cent. more.

New Life has been instilled

into the settlement of these counties by English colonization and enterprise, under the management of Messrs. Close Brothers & Co., Lemars, Iowa, and Close, Benson & Co., 38 Cornhill, London. As representatives of English capital they have this Spring purchased about 40,000 acres, sold about 20,000 and are still purchasing for parties abroad. In Lyon County they are managing over 20,000 acres, one-half of which was broken and seeded the past Spring, divided into 100 or more farms; over 100 houses and barns were built and these farms rented to American tenants. The exact opposite of the Dalrymple plan is that pursued by these gentlemen, as with them those who till their soil have an interest in the proceeds. In Sioux County they are managing two whole townships (a township is six miles square) equal to 46,080 acres, of which probably 7,000 have been brought under cultivation this year and divided into about 60 farms; and in Osceola County the breaking will amount to nearly 10,000 acres, and the houses built number 100. Parties renting and remaining a few years will have become familiarized with the county, crops, markets and prices and can buy. They pay $2 25 cash per acre for breaking and when desired furnish flax for seeding on the sod. The herd law is the poor man's friend and helps many a one to get a start in this county, who could not afford to fence the land. This firm also controls the sale of over 100,000 acres of railroad lands in these and adjoining counties. Many Englishmen are settling in Northwestern Iowa through this agency, purchasing and improving homesteads, in size and manner according to their tastes and means. We did not meet these gentlemen during our stay in these counties, but were informed by those who know, that they had been the means of bringing over $600,000 of money into this part of the State within the past two years, and were developing large stock farms, as individual investments, in Plymouth and Woodbury Counties. Their average price is $6 per acre. Taxes are doubtless higher here than East, literally stated, but in fact they are much lower, when you estimate the difference in valuations—upon which, of course, the taxes are levied.

SIBLEY.—The county seat of Osceola is a prettily located prairie town on the Chicago, St. Paul, Minneapolis and Omaha R. R., passing through the west half of the county diagonally northeast and southwest. It has a population of about 400, three church organizations, (with two buildings), a good public school, with two teachers; a wide-awake newspaper, a home-like and well-kept hotel, two banks, a dozen stores, more or less, two lumber yards and a grain elevator. It commands a large radius of trade and is destined to become a commercial town of some importance. They need a good steam flouring mill, and other industries which a visit here would suggest. For assistance extended us in this county by C. Bull, banker, Barclay and Bull, real estate dealers; Capt. E. Huff, real estate and D. L. McCausland, real estate and stock raiser and dealer, we return thanks, and feel confident that any correspondence addressed

to any of them, will receive courteous and prompt attentions.

ST. GILMAN is eight miles south of Sibley, on the same railroad. It has 100 population, one store, (Farnsworth &Wyatt), a lumber yard, grain dealer, shops, etc.; its surroundings are rich and productive.

ROCK RAPIDS is the county seat of Lyon County, on the western bank of Rock River, and on another Division of the C. St. P. M. and O. R. R. It has nearly 600 population; ample church privileges, and educational advantages, a good local paper, two flouring mills, fully $50,000 banking capital, good stores, well-stocked hotels, shops and energetic, enterprising inhabitants. They need a tow mill, and from the increased quantity of flax, we should think an oil mill would also pay. Here we received valuable aid from J. Shade County Treasurer, and real estate dealer, M. W. Dickinson, his deputy, the Bank of Rock Rapids, and the Lyon County Bank, both dealing in real estate, and from J. F. Eccleston, attorney and real estate dealer, to all of whom we extend a hearty "thank you."—Continued next week.

BRIC-A-BRAC.

THE LIVELY MOSQUITO.

A well-known member of the "art preservative," rythmical ebullitions from whose pen occasionally appear in the Bee, has been having a little severe experience with that lively bird, the mosquito, and this is how he gets even with him:

The pesky creature comes at night,
As soon as I blow out my light.
Anon he lights upon my face,
And, picking out a tender place,
Inserts his bill beneath the skin,
Then sucks the liquid freely in.
Down goes my hand with a "kerslap,"
As he begins my blood to lap;
But he escapes upon the wing,
And in the air I hear him sing.
Ere long I get into a doze,
But soon I feel him on my nose—
Then quietly I set a trap,
With the fond hope his head to "tap."
Of my intent full well he knows
(While sitting there in calm repose),
And quick up to the ceiling goes,
Surcharg'd with blood drawn from my nose.
Another charge he makes with "vim,"
And I essay to capture him;
But, with all my hearty slapping,
Cannot catch the creature "napping!"
It's no use! try as I will,
I cannot rid me of his bill!
So on my pillow keep quite still,
While of my blood he takes his fill!
In my dreams I see him lipping
The sanguine meal he'd been sipping;
And, while much pleased he seemed to be,
He laughs a laugh of fiendish glee;
And sitting there upon the wall,
With bloody bill and red eye-ball,
He makes my heart with horror swell,
As he gives forth his fiendish yell!

NO SECRETS FROM SCIENCE.

The doctor arrives at the hospital to make his daily visit of inspection, and receives the ticket of a new patient, "X, musician in German band; pulmonary consumption."

He proceeds to the patient's bedside, surrounded by his admiring class.

"Well, my good fellow, you spit blood, don't you?"

"Yes, doctor, I—"

"That'll do; we know all about it. And you have cold sweats at night, eh?"

"Yes, sir, and—"

"I fancy now that by occupation you are a musician?"

"Yes, I play—"

"Be silent. You belong to a brass band, and you have exerted yourself—have fairly blown your lungs away puffing into your instrument. Gentleman, you perceive that sickness has no secrets from science. What instrument do you play upon, my good man?"

"The cymbals, sir."

Consternation on the doctor's part, and amusement of the students.

MOTHER'S CLOCK.

A YOUTH sat on a sofa wide,
Within a parlor dim;
The maid who lingered by his side
Was all the world to him.

What brought the glad light to his eye—
That cadence to his tone?
Why burns the lamp of love so high,
Though midnight's hour hath flown?

The clock above the glowing grate
Has stopped at half-past ten;
And, long as that young man may wait,
It will not strike again.

The artful maiden knows full well
What makes the clock act so,
And why no earthly power can tell
The time for him to go.

—Springfield Republican.

A YOUNG lady was married in Louisville the other day, and a newspaper account of the event was headed, "Mated in May." The New York Graphic supposes that "Joined in June," and "Attached in August" will be the fate of those who come later in the season. It is to be hoped that "Separated in September" will be needed in no case.

HOW THEY SWEAR.

The river says, I'll be dammed.
The stocking says, I'll be darned.
The furnace says, I'll be blasted.
The doctor says, Plague take it.
The teacher says, Well, that's cool.
The scholar says, I'll be switched.
The preacher says, Mercy on us.
The farmer says, Land sakes.
The lawyer says, hold up your right hand.
The merchant says, By the prophets.
The newspaper man never swears—that is.

"ONLY IN FUN."

He knelt at the feet of his charmer
And clasped her soft hand in his own;
He talked in a way to alarm her,
Of love but her heart was of stone.

Her "nay" to his suit was surprising,
For he had considered her won.
"Ah well," he exclaimed, quickly rising,
"You know I was only in fun."

And shortly he left, when she, sighing,
Said slowly, "Ah! what have I done—
Come back, oh, my love, I am dying—
'Twas I, not thyself, was in fun."

—Norristown Herald.

A DISAPPOINTED HUSBAND.

Thirty days after a Michigan man got a divorce from his wife to marry one with a handsomer face, the woman fell heir to $287,000. You bet that ex-husband feels like a man with a jumping toothache.

AMERICAN COURTSHIP.

Who am I? I'm Miss Midget's beau;
Age, twenty; name, T. Tompkyns Snow.
Dress, nobby; travel on my check,
And earn six dollars in a week.

Who is Miss Midget? She's a blonde;
Of cream and candies she is fond;
Likewise of me, is sweet sixteen;
Can play a piano, is a queen.

Do I intend to marry? Why
Of course I do, that is when I
Get rich, and yet, 'most any day,
My fate and I may run away.

What would we live on? Well, my plan
Would be to board with her old man.
He couldn't see us starve and I
Would be his partner, too, Bye-bye!

—H. C. DODGE.

For Women.

CONDUCTED BY MISS RAY CLARK.

ORCHARD WEDDING.

[From Mary Mapes Dodge's new Book of Poems.]

THERE'S a wedding in the orchard, dear,
I know it by the flowers;
They're wreathed on every bough and branch
Or falling down in showers.

The air is in a mist, I think,
And scarce knows which to be—
Whether all fragrance clinging close,
Of bird-song, wild and free.

And countless wedding jewels shine,
And golden gifts of grace;
I never saw such wealth of sun
In any shady place.

It seemed I heard the fluttering robes
Of maidens clad in white,
The clasping of a thousand hands;
In tenderest delight.

While whispers ran among the boughs
Of promise and praise;
And playful loving messages
Sped through the leaf-lit ways.

Then were there swayings to and fro;
The weeds a-tiptoe rose,
And sang the breeze a sudden song
That sank in sudden close.

And just beyond the wreathed aisles
That end against the blue,
The ralment of the wedding choir
And priest came shining through.

And though I saw no wedding guest,
Nor groom, nor gentle bride;
I knew that holy things were asked,
And holy love replied.

THE INFLUENCE OF GOOD BOOKS.

MAY MAPLE.

JUST how many times my mother had given me lessons upon making beds I know not; but often and often had she told me that the right side of the sheets must face each other, and that the under sheet must cover the top and sides of the bed and be nicely tucked down all around; in this way the bedding would be kept clean much longer than if the sheets were put on in a careless, hap-hazard manner. The blankets were to be spread on smooth and square, with only the drapery of the counterpane and pillows visible when the work was completed. But in my childish haste the sheets were not unfrequently put inside out, the broad hem ornamenting the foot of the bed, the quilts hung one below another, shingle fashion, while the corners draped the floor in anything but a graceful and tidy manner.

It mattered not how often I was told of my failings, or how many times I was made to do my work over again, the lessons were all unheeded in less than a week and must be repeated. When I was nearly, or quite, twelve years old, my mother gave me a small book which she had received as a gift when a child. I had long desired to know the contents of this book, which I knew was one of her treasured keepsakes, but when I had asked to read it she had always put me off with, "When you are old enough to appreciate its lessons, you shall have it for your own." It was a happy day to me when she considered me "old enough." I took the book from her hands and hastened away to my favorite "reading room," which was in the top of an old plum tree in the garden, where birds and breezes were welcome companions. Very soon I was deeply engaged in the story of "Anna and Lizzie," which, as I remember it now, so many long years after, consisted of two characteristic little girls who lived with an aunt. Of course, one of them belonged to the "goody-goody" class, and kept everything about her room and person in the most perfect order. Her bed was always made as if in a mold, without a wrinkle in sheet or quilt, and the sheets "faced together" as my mother had so long and patiently tried to teach me to spread mine; her clothes were always kept in repair by her own tiny hands; her ribbons were neatly rolled and kept in a box; she never failed to find her gloves or her handkerchief in their proper place; in fact, the author had portrayed Anna as a paragon. Of course, everybody loved her and praised her for her fine qualities.

Lizzie was more like myself, a little hoyden, careless to an extreme, with only occasional streaks of neatness. And no amount of precepts, gentle or otherwise, had any lasting effect. Finally, their aunt proposed to make a party for the little girls at a given time. During the week that intervened each should have the entire control of her own room and wearing apparel, and no censure or praise would be given to either till the day of the party, when each child should receive the reward of her doings. For two or thee weeks Lizzie's room with all its appurtenances looked as well as Anna's. But after that she began to fail in her duties, particularly about the bed, which was too often spread up hastily, the quilts lying in folds from corner to corner, the sheets peering out at the foot of the bed, the pillows tossed carelessly as near the center of the bed as they were to the polished headboard, also showing marks of dust gathered from the floor where they had been thrown while the bedding was left to air.

At last the day of the party arrived and the girls were called to their aunt's room to don the new party dresses, which they now beheld for the first time. Anna's was of pure white muslin with beautiful lace trimmings and blue ribbons. While careless Lizzie was the possessor of a dark calico dress ruffled at the neck and sleeves with the same. But during the afternoon she seemed to forget her mortification of the morning, for she had a sunny nature and could laugh and play as well in her homely calico as could her cousin Anna in her more costly India mull. But when the little girls and their guests were called to tea, Lizzie was given a table by herself with soiled napery and wooden dishes that held some brown bread, butter and apple sauce, while Anna and the visitor were directed to seats at the large table, that was covered with the finest white linen cloth and set with china and glass dishes, well filled with white bread and golden butter, frosted cakes and rich preserves, oranges, nuts and candies. This was a little too much for Lizzie, and when auntie explained to all why she had made such a contrast, Lizzie burst into tears and at once left the table and the room. Of course, according to the author, this treatment effected an immediate cure with the little hoyden, and she was ever after as orderly as her cousin Anna.

I really do not have much faith in such sudden cures of long established maladies; but the little story made a marked impression on my mind, and I began to gradually mend my ways. About this time I read "Miss Ophelia's Lesson to Topsy," on making beds, and the two stories added to my mother's patient teaching taught me at last how to make a bed properly. And though many years have passed since then, I seldom do this work without thinking of careless Lizzie, Topsy and mother. So I say, give the little folks books that are likely to make the best impressions, and that they will have occasion to rejoice over all the days of their lives for the good lessons taught therein.

ETIQUETTE.

WHILE not pretending to any extensive knowledge on the subject of etiquette, I am tempted to reply to "Rural Sister."

In the strictly fashionable world there is often much stress laid on very small points, and only they who make a study of social etiquette can be armed for every detail.

Politeness is the same the world over; etiquette varies greatly in different localities. A courteous, well-bred young lady will always appear with propriety, or if she violates any rule of local etiquette, the deed will not be very shocking. A consideration for the feelings of those around her will always suggest the proper thing to do, or at any rate will lead her to do what she does with a naturalness and genuineness that will make the act or words *her own*, and the effect what she intended it to be, independent of any arbitrary rules.

It is impossible to write out a code of laws perfectly applicable to every occasion, and general rules must always be modified by common sense to suit the various times and conditions.

In announcing or introducing a guest, if the company is seated around the room in a row, silent and awestruck with anticipation, or fearful of making some *faux pas*, or immovable and unspeakable for some unknown reason, it is very well to take the stranger around and give an introduction to each one, although it seems to me—to an easily embarrassed person—a uselessly trying experience, and I always prefer being introduced here and there during the evening, when and where I can have an opportunity of saying something more than the stereotyped introductory phrases. If the company is sensible and group about conversing with some degree of animation, it is easy for the hostess to introduce the stranger with ease both to herself and guests.

Rural Sister asks, "Is it strictly improper for a lady to thank a gentleman for his company; is it proper for a lady to thank a gentleman for his attentions?" I do not understand her distinction of the difference between "company" and "attentions." I am also too old-fashioned to believe that every act of politeness from a gentleman is to be taken as a matter of course by the recipient, nor do I like the attitude which I have known many young ladies to take, which asserts complacently that their society sufficiently repays any trouble which a friend may take for them. Let common sense be the basis of all rules and the young woman will not take it for granted that every gentleman she meets is ready to sacrifice himself at any cost for her sake. Let her accept a kind offer to see her home from a party some cold night, and when he has taken the long walk to leave her safe on her own doorstep, be he young or old, I cannot see why it is not better to take it as a friendly service and acknowledge it in a graceful manner, rather than by a lack of thanks of any sort to assume that she is so charming and he so charmed that anything more is superfluous. Undoubtedly there are many times when direct thanks would be out of place, but the true woman will seldom be at a loss to express her appreciation of kindness, her enjoyment of the drive or evening's pleasure, while the fact of her not taking it as something due, or expected, would make it easier and safer for the friend, or prompt more marked attention if he wished to be considered more than friend.

It is impossible to lay down rules suitable for all persons. In this age of forward youth it would hardly be safe to propound as a law what would be perfectly right for the well-meaning, well-bred womanly girl. It is better to be too backward than too forward, and it depends greatly on her, what she is and with what propriety she conducts herself, whether she should "invite a gentleman to call." If she can entertain him with sensible conversation, and be free from all manner of silliness, she may invite her friend to call, and when he comes let the family enjoy the pleasure of his society also.

If there is one object at which nobody ever fails to laugh, it is at the woman who courts attention, who is constantly "throwing herself at some one." She invariably loses what she covets by overdoing the matter, for modesty and true womanliness gain more real admiration than boldness and forwardness, which may seem to carry the day.

As for the last question, I never think of refusing to acknowledge the salutations of my friends who daily pass by my windows, because some panes of glass are between me and them!

I am not, as I have said, one of the "wise" ones, but I have ventured to give my opinions.

She must be very judicious and discreet who never commits even a slight error in matters which must be left often to one's own judgment, but she who is guarded by self-respect and true womanly reserve will not make mistakes which cannot be readily forgiven and overlooked. R. B.

OUR TRAVELS.

VALENA.

ARRIVING at New York upon the eve of election day, we saw numberless bonfires in the streets, upon the outskirts of the city. These fires, though of no great magnitude, were emblematic of the patriotic love for our country burning in the hearts of her boys. Leaving the cars we proceeded to the house Stewart built "For Women." It is a large iron structure, painted dark; it has an elegantly furnished parlor and a well filled library; but failing to be profitable for the purpose for which it was built, it has been turned into a hotel. We could not but think it a monument turned into an Exchange for making money.

Business calling the Professor to another part of the city, the following morning, we concluded to go to the house in which Sam Slick stopped forty years ago. Saw here the window "with a stun cut wreath," through which, Sam said "he looked out of to view the metropolis." We looked for B. Bobbet and Josiah Allen's wife, knowing this was the hotel where they "put up," and in this building where "Josiah's wife offered to help Mrs. Astor wash the dishes." But a little way from this building is the grave of Charlotte Temple, the story of whose life we read and cried over when a child.

The "Society of Mechanical Engineers" having their meeting at this time, it was our good fortune to meet many eminent mechanical men and listen to several very valuable papers on mechanical subjects. In machinery there is a fascination that but few can resist, even though they may not understand its principles. We all, like Toddy, "want to see the wheels go round." We went to the Fair of the American Institute, visited several Art Galleries, the Decorative Art Rooms, "The Rural New-Yorker" and some other popular periodical offices. We became very much interested in some pen sketches, and have tried our hand at such work with gratifying results. Sometimes, by bringing to notice such little things an inspiration is caught which works itself into a name. It is my belief that genius often lies dormant until some circumstance lights the fire. Therefore it should be our pleasure to exhibit and explain whatsoever handiwork we can, whenever an opportunity offers. Although not caring to copy the thing seen, it may awaken suggestions which, if wrought out, may possess merit and ingenuity.

We are learners and the more knowledge we have with ability to make good use of it, the more valuable we are to our family, our neighbors and all with whom we may associate. People say "he is gifted," when they mean he has seen and learned a great deal, and has the ability to do as well as talk.

Prizes are offered in decorative designs and wood engraving. These prizes are won by those whose fertile brain and skillful hands have wrought the most original and artistic work. Generally they are the inquiring minds whose observations have been quickened in childhood and guided into channels where brain-work and hand-work are combined harmoniously. One who has the opportunity to travel, has an opportunity to see much that is valuable. He can compare the work of many good workers and become, to quite an extent, a proper judge of artistic work. If he is a reader, he can easily learn to whom to look for standard work, and thus lay up a store of much that is valuable. Our tastes are improved by comparison; we see an ordinary piece of work and if we have never seen better, to us it is good. We view a fair painting, and if our eye has not been cultivated by seeing those superior to it, to us it is exquisite, although the coloring is crude.

But it takes a well-balanced mind to know

more than your neighbors, and not give offense and such is the case with those who are well-informed. This, however, is digressing from "Our Travels." To resume, we left the city containing the obelisk, though still in its traveling robes, and set our faces toward Washington, of which we will write in our next letter.

[NOTE.—The above letter has been in our possession some weeks awaiting insertion. We would more freely ask forbearance of the writer, for the unavoidable delay, did we not consider the article of sufficient interest to be timely.]

HOW TO BE HANDSOME.

To be beautiful in person we must not only conform to the laws of physical health, and by gymnastic arts and artificial appliances develop the elements of physical being in symmetry and completeness, but we must do more—we must cultivate the mind and develop the affections to the highest possible degree.

To be beautiful we must feed the spark of intellectual fire by reading and meditation until it burns in steady flame, irradiating the face by its brilliancy, and suffusing the countenance with a calm and holy light; also, we must fill the brain with sublime thought, and live surrounded, as it were, by an atmosphere of ideas.

To be beautiful we must put a great organizing and ennobling purpose into the will, and concentrate our thoughts and affections upon the accomplishment of it, until enthusiasm wells up in the heart, suffusing the countenance and rebuilding the body on its own divine plan.

To be beautiful we must cherish every kind impulse and generous disposition, making love the ruling affection of the heart—the ordering principle and inspiring motive of life: the more kindness, the more beauty; the more love, the more loveliness.

And this is the beauty that is abiding. Mere physical good looks fade with the years, bleach out with sickness, and yield to the slow decay of mortality. But the beauty that has its origin in kind dispositions and noble purposes and great thoughts, outlasts youth and maturity, increases with years, and like the luscious peach which comes to us in autumn ripeness, covered with a delicate flush of purple and crimson, is never so beautiful as when waiting to be plucked by the gatherer's hand, silently witnessing to the full the rich perfections time works out.

PEDESTRIANISM.

YESTERDAY I called on an invalid friend, and while we were discussing the remarkable Winter and Spring of 1881, I told her that on the 6th of April, I had walked a mile one morning across the fields over the frozen snow, and the whole distance the drifts were as high as the top of an ordinary board fence and I walked over the tops of several fences where the posts were buried out of sight in snow. It was such an unusual thing for the time of year in our locality (Southern Wisconsin) that I made a note of it for future reference.

To my great amusement, my friend replied with a smile. "The most extraordinary part of that performance was that a woman of your family should be able to walk that distance.

It seems that the school teachers who learned to walk when boarding around was necessary, do not forget in after years, but always keep the accomplishment." It had never struck me so forcibly before that my habit of walking when I had an opportunity was something to be thankful for. I remembered how much I had enjoyed that walk over the crisp snow, stopping here and there to notice how different the beautiful rolling prairie looked so covered with snow to what it did when covered with the verdure of June. So I would like to advise all young and married ladies, if they have not acquired the art of pedestrianism to learn and practice it. I know many hard-working women who would not, if they could walk a quarter of a mile from their homes. Aside from the healthful practice of walking it gives one an independent feeling to be able to make a trip on foot; it is often very convenient too. B. C. D.

FASHIONS.

Polka-dotted neckerchiefs trimmed with Breton laces are worn with morning or traveling costumes.

For an evening a pretty way is to have all the hair waved over the head, with a few loops and curls at the back.

Pretty suits for croquet or lawn tennis may be made of unbleached cotton cloth, trimmed with bands of Turkey red or other bright-hued calico.

Corsage bouquets are now very fashionable, the field daisies being among the favorites. When saucers, rather than dinner plates, are the proportionate size, they add greatly to the dress.

Lace ruches and bows are a fashionable finish to Summer toilets. Fancy brooches or lace-pins are worn with them, in all sorts of odd devices, Lady-birds, choral shrimps, gold cockatoos' heads, owls' faces, Shetland dogs' heads are among the most popular for fastening lace bows or bonnet strings.

Velvet is worn on the cooler days in the manteiets and casaquin jacket to wear with any skirt. The latter, indeed, will prove very acceptable at the seaside; and velvet is not, after all, any warmer than brocaded silk or satin, neither of which have been by any means given up throughout the Summer.

The greater number of dresses intended for wear at watering places this season are short; indeed, only grand toilets are made with trains. When the same dress is intended to do double duty, for afternoon wear and also for evening, it is made short and elaborately trimmed, an adjustable train being added, which may either be worn or not, at the owners pleasure.

The materials chosen this season for traveling dresses are cloth and bunting, cheviot and Summer camel's hair. They are made up plain, the skirts generally having wide kilt plaits, with a scarf drapery caught against these plaits. The back is more or less bunched, and has a suitable finish in pending breadths, left single or united, as may be preferred. Basques are not abandoned but the preference is given to jackets which fit the figure loosely. The latter are most stylish when they have an easy appearance.

For the warm weather a great many little mantles are made of the same material as the dress. Small manteiets pinched in front for silk costumes; casaquin jackets crossed in front, fastened with very large and handsome buttons, and made of striped tissue when the dress is partly striped and partly self-colored. Sleeves are made very narrow, and never come within two inches of the wrist, for gloves are worn longer and longer, either with at least four buttons, or without any buttons at all, and creased in ripples over the arm.

Brocaded fabrics were the distinctive trait of last year's fashions; shaded materials are that of the present season's. Everything is shaded—silks, satins and cashmeres, ribbons, flowers and feathers, every item of a lady's dress, from her hose to her head-gear, is graduated from the darkest to the lightest shades. It is, however, more especially in ribbons that this disposition appears, and almost all the new bonnets are trimmed with it. Flowers are also very beautifully shaded; poppies, carnations, hollyhocks and the larger kinds of roses are among favorite blossoms, and are intermixed with light sprays of forget-me-nots and mignonette, stephanotis and heather. Dresses of shaded material require great taste and skill in their cutting out and making up, so that the different shades, so beautifully blended in the piece should not be too harshly contrasted in the making of the dress. Anything so straight and regular as pleats or fluting should not be attempted with such dresses, but loose draperies can be made to look very effective and the Jersey bodice with seam under the arms only, should be adopted as making fewer breaks in the pattern.

"THE CYCLOPÆDIA WAR."

The Cyclopædia War and the Literary Revolution are working wonderful and happy results for the readers of books, and searchers after knowledge. The great "Library of Universal Knowledge," is announced to be completed, ready for delivery to purchasers, the early part of July. It is probably the largest and most important literary work this country and the century have seen. It is based upon Chambers's Encyclopædia, the last London edition of which is reprinted entire as a portion of its contents, a large corps of American editors and writers adding thereto, a vast amount of information about 15,000 subjects in every department of human knowledge. Chambers's Encyclopædia, whose distinguished merit is universally known, is the laborious product of the ripest British and European scholarship, but being a work of foreign production it has been naturally deficient in its adaptation to the wants of American readers. In this new form it is most thoroughly Americanized, and becomes at once the largest and most complete encyclopædia in the field, at a mere fraction of the cost of any similar works which have preceded it, containing about 10 per cent. more matter than Appleton's Encyclopædia at a little more than one-fourth its cost.

The superlative value and importance of this great Encyclopædia, however, lies especially in the fact that it is brought within the reach of every one who aspires after knowledge and culture. It is *really* a library of universal knowledge. It brings a liberal education easily within the reach of every plow-boy. Every farmer and every mechanic owes it to himself and to his children that such a cyclopædia shall henceforward form a part of the outfit of his home. To the intelligent man in every walk of life a cyclopædia is indispensable. It is issued in various styles, in 15 large beautiful octavo volumes, varying in price from $15 for the edition in cloth, to $25 for the edition in full library sheep binding. Liberal discounts even from these extraordinary prices are allowed to clubs, and the publishers, besides, propose during the next two months to distribute $10,000 cash in special rewards to forward clubs of five, ten or more subscribers. The American Book Exchange, 764 Broadway, New York, are the publishers, who will send sample pages and full particulars free on request.

Hop Bitters does not exhaust and destroy, but restores, cures, and makes new.—*Adv.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

SOAP BARK FOR CLEANING BLACK GOODS.

FOR removing spots and dust from black goods of all kinds, a decoction of soap bark has given the best satisfaction of anything we have tried. In fact, we would not be without it. Buy a few cents worth—to be had of any druggist—break into bits, steep a while in a little more than water enough to cover, strain, and it is ready for use. Brush the goods free from dust, dip a piece of black cloth into the decoction, squeeze out and rub the soiled parts. If a thorough renovation of an article is desired, rip apart, brush from it every particle of dust, and with a cloth dipped into the decoction wipe off each piece, folding it up as you proceed. Then with moderately heated irons, smooth and press the goods upon the *wrong* side until dry. As for *silk*, we prefer to fold it and place under a heavy weight until dry, instead of ironing. Of course, the goods should be but dampened with the liquid.

WEAK FISH.

Know that they are freshly caught, then remove scales, split from head to tail, wash, salt and pepper and hang where they can smoke for an hour before cooking. If you have no smoke-house, knock the bottom out of an old barrel, drive in a few nails through the staves near the top, hang the fish on them, build a *little* fire on the ground, place the barrel over it, cover the top and you have improvised a very good smoke-house for smoking fish, eels, etc. To our taste all fish are improved by smoking. Broil or fry in butter or drippings.

IN-GROWING TOE-NAILS.

THIS very painful disease of the nails is caused by the improper manner of cutting the nails and then wearing a shoe too tight for the foot. Apply to the tender part a small quantity of perchloride of iron. You can buy it either in the fluid or the powder form. The patient will at once feel considerable pain, but in a few minutes the tender surface is felt to be mummified, so to speak, and it ceases to be painful. Permit the dried flesh to remain two or three weeks, when it can be removed by soaking the foot in warm water. A new and healthy flesh will have formed beneath. If the nails thereafter are not cut around the corners or sides, but cut square across the top, with a small notch in the center, they will be found to grow only forward, and all further trouble avoided.

MRS. J. BRADY.

APRONS—DISH-CLOTH.

IF Mrs. J. M. M. would make her kitchen aprons of thin oil-cloth instead of cheviot, her weekly wash would be greatly diminished. But oil-cloth is somewhat heavier than cheviot, and would need to be banded at the waist or pinned to the bosom of the dress. Mine is of wood-color, and looks neat and pretty. I also make aprons of oil-cloth for my children, who are learning to eat at table. Make them to fit close around the neck, and long enough to cover the little boots as they sit in the high chairs. Our afternoon aprons should be made of something that is easily laundried, as we are often obliged to turn from the sewing machine and take little two-year-old when his boots are "just horrid." Fine, soft, unbleached cotton is the best for this purpose, as it washes easily, is durable, cheap and pretty, and will admit of a variety of trimming. I am in favor of making this "badge of servitude" as pretty and becoming as possible.

I am possessed of an article which I think deserves to be spoken of in the Domestic column—a steel dish-cloth for cleaning saucepans, etc. It is about five inches square, one-half inch thick, and made of steel rings linked together.

MRS. M. B. H.

DOMESTIC RECIPES.

Huckleberry Pie.

OUR friends will find this pie much improved, by adding a couple of sliced harvest apples to each pie. Place the slices, over the top of the berries and cover with a crust.

Vanity Puffs.

Beat the whites of six eggs to a stiff froth sift in a pound of powdered sugar, and flavor with lemons. Drop by small spoonfuls upon buttered paper and dry in a cool oven two hours.

To Restore Window-glass.

When glass becomes smoky and opaque looking, rub with a dilute muriatic acid and then clean with moistened whiting.

Cherry Catsup.

One pint of cherry juice, three-fourths pound of sugar a teaspoonful each of ground cloves and cinnamon with a dash of cayenne pepper. Boil until a thick sirup then bottle and seal.

To Dry Sweet Corn.

Cut off only the outer part of the kernels and scrape the rest from the cob. Cook 10 minutes, spread upon earthen plates and dry in the oven. Careful not to burn.

To Prepare Mustard.

Let a pint of good vinegar come to a boil, stir in a quarter of a pound of mustard two tablespoonfuls of sugar, a tablespoonful of salt and a small spoonful of white pepper. Let the mixture boil five minutes. MARY. B.

Stuffed Steak.

This makes an excellent substitute for the expensive roast. Select a good round steak, pound, season with pepper and salt, cover with a nice dressing of bread crumbs, roll up and tie tightly with twine. Pour a little hot water into the dripping-pan, add a spoonful of butter, put in the steak and bake, basting frequently. F. S.

QUESTIONS ANSWERED.

Infants' Powder.

Is there a *harmless* infants' powder? There is so much said now-a-days about cosmetics that I am afraid to use any upon my child, although of course I stand in need of something.

ANS.—Perfumed corn-starch makes an excellent powder, and when used in moderation is, according to our thinking, harmless. Take any suitable paper box having a tight-fitting top cover the bottom to the depth of half an inch with corn-starch; over this place a piece of writing paper saturated with any extract—we use patchouly, thinking it imparts to anything a "cleanly" odor—and cover with starch to the depth of another half inch. Repeat until you have in a sufficient quantity of starch. Cover and tie up in paper a few days before using. Always keep the box covered.

[Harrisburg, (Pa.) Independent.]

For five years, says Mr. J. Echter, this city, I have been afflicted with rheumatism, and for two years have had a sore on my leg the size of a silver dollar, which nothing would heal. St. Jacobs Oil cured the rheumatism and healed the sore.—*Adv.*

Miscellaneous.

ST. JACOBS OIL

TRADE MARK.

THE GREAT GERMAN REMEDY.

FOR

RHEUMATISM,

Neuralgia, Sciatica, Lumbago, Backache, Soreness of the Chest, Gout, Quinsy, Sore Throat, Swellings and Sprains, Burns and Scalds, General Bodily Pains, Tooth, Ear and Headache, Frosted Feet and Ears, and all other Pains and Aches.

No Preparation on earth equals ST. JACOBS OIL as a *safe, sure, simple* and *cheap* External Remedy. A trial entails but the comparatively trifling outlay of **50 Cents**, and every one suffering with pain can have cheap and positive proof of its claims.

Directions in Eleven Languages.

SOLD BY ALL DRUGGISTS AND DEALERS IN MEDICINE.

A. VOGELER & CO.,

Baltimore, Md., U. S. A.

COUNT RUMFORD.

PROFESSOR HORSFORD'S PHOSPHATIC BAKING POWDER

Made from Professor Horsford's Acid Phosphate.

Recommended by leading physicians.

Makes lighter biscuit, cakes, etc., and is healthier than ordinary Baking Powder.

In cans. Sold at a reasonable price.

The Horsford Almanac and Cook Book sent free.

Rumford Chemical Works, Providence, R. I.

NASAL CATARRH and BRONCHITIS.

Childs Treatment for NASAL and BRONCHIAL CATARRH is the only one that can be relied upon for the **Permanent and Positive CURE** of this disease. **Home Treatment.** Physicians recommend it. For details of method and terms, address **Rev. T. P. CHILDS, Troy, Ohio.**

GOLD MEDAL, PARIS, 1878.

BAKER'S

Vanilla Chocolate,

Like all our chocolates, is prepared with the greatest care, and consists of a superior quality of cocoa and sugar, flavored with pure vanilla bean. Served as a drink or eaten dry as confectionery, it is a delicious article, and is highly recommended by tourists.

Sold by Grocers everywhere.

W. BAKER & CO.,

Dorchester, Mass.

News of the Week.

HOME NEWS.

As we go to press the following dispatches are received:—

FIRST DISPATCH—10:20 A. M.—President Garfield is shot.

SECOND DISPATCH—10:30 A. M.—The President is reported mortally wounded and dying.

THIRD DISPATCH—10:40 A. M.—The excitement is so great that it is impossible to state anything definite as to the President's condition. The assassin is captured.

FOURTH DISPATCH—11:15 A. M.—The assassin's name is Charles Gitteau.

FIFTH DISPATCH—11:25 A. M.—There is a rumor that the shooting was done by the ex-Consul to Marseilles, who was removed from office.

SIXTH DISPATCH.—12 M.—The physicians have held a consultation and say the wounds are not necessarily fatal.

LATEST, 3:50 P.M.—The President is dying.

VERY LATEST, 4 P.M.—The President is dead.

The President was just leaving Washington for the Williams College commencement, and was to meet his wife at Long Branch on Saturday. On Monday he was going to Williamston, Mass., and on Thursday to St. Albans, Vt.

THERE are 18 sensible men at Albany anyway. Nine Stalwarts against nine Democrats played a game of base ball Wednesday for the benefit of the families of the men killed on the new Capitol. The game lasted three hours and resulted in a score of 58 to 26 in favor of the Democrats; $110 were received at the gate.

President Garfield, in accordance with the instructions of Congress, has invited the descendants of Lafayette and Rochambeau to be the guests of the nation, at the time of the celebration of the centennial of the battle of Yorktown. President Grevy has acknowledged the compliment by detaching several persons high in official position to represent the French republic on that occasion. Rhode Island is the first State to invite the distinguished strangers to be the guests of its people, but the matter has been mentioned in Massachusetts, New York and Pennsylvania.

Washington firms have secured the contract for supplying Brussels carpet for the public buildings under control of the Treasury Department. About 15,000 yards will be required for the next fiscal year. The contract price is $1.19 per yard.

At the annual meeting of the Wisconsin State Bar Association, held at Madison, a largely-signed petition from the prominent lawyers of the state was presented, asking that a suitable monument be erected to the memory of the late Senator Matt. H. Carpenter. It is proposed to raise the necessary funds by a popular subscription of the people of the State at large.

Secretary Kirkwood has appointed Francis La Flesche to a clerkship in the Indian Office. The appointee is an Indian, a brother of "Bright Eyes." This new departure in selecting an Indian to help manage the Indians may lead to important results if it is honestly persevered in.

A most remarkable instance of wholesale poisoning came to light on the 28th inst., at Wilkesbarre, Pa. Thirteen Hungarian miners at Hazleton, Pa., were poisoned by eating bologna sausages, and five are reported to have since died.

At 12 o'clock on Tuesday night Sanderson's stage from Lake City to Alamosa, Col., was robbed by two masked men ten miles west of Alamosa. There were five men and one woman in the coach, and the robbers secured between $800 and $900 from them. It is not known how much they secured from the mail and treasure box of the coach. There is no clue to the robbers.

The finding of the Whittaker court-martial was forwarded to Washington from this city on the 29th, together with the record of the proceedings, which comprises 7,600 foolscap pages.

Heat, hail, gales, thunder-storms, and terrible tornadoes have made havoc North, South, East and West during the past three days. Superstitious people, who connect the appearance of a comet with physical disasters, must have been confirmed in their error when they saw trees uprooted and houses leveled by these cyclones, churches lifted from their foundations and shattered into splinters, barns set blazing, and cattle killed by the terrific and incessant lightning, hail scourging whole villages and laying waste the harvests for miles, and reservoirs bursting under the sudden deluge of rain.

The directors of the Great Eastern steamship Company have decided to offer the Great Eastern steamer at public auction on the first of next October unless she is previously disposed of at private sale.

Most of the immigrants from Stuttgart, Germany, literally come by chance. The members of a society in that city contribute a certain amount every month, and the fund thus raised is used in helping people to come across the ocean. The names of all applicants are put into a lottery wheel, and the winners receive passage money, which they bind themselves to pay back as soon as they are able.

Tuesday, a storm leveled the telegraph wires in Chicago. At Alexandria, Mo., a row of business places was struck by lightning and burned; loss, $32,000. At Franklin, N. H., a hail storm tornado did great damage. Half of the houses in the town had their windows shattered. The Methodist church was damaged by floods of hail and the rain which poured through the shattered windows. The Catholic church was moved six inches on its foundation and was twisted and badly damaged. Several buildings were totally wrecked. Freight cars at the depot of the Northern railroad were blown off the track.

Mrs. Abraham Lincoln continues dangerously ill. Senator David Davis, who is executor of her late husband's estate, has been summoned to her bedside.

There arrived at Castle Garden in the month of June 59,416 immigrants, making the total for the first six months of the year 241,498. This is 64,513 more than arrived in the first half of 1880, in which the arrivals were more numerous than ever before.

The quarter of a million dollars raised by subscription for ex-President Grant has been invested in United States four per cents, and is to be presented to him privately.

Ninety clerks will be removed from the Pension Office in a few days.

More than 1,400 new Post Offices have been established in the past year.

Resistance to the new prohibitory laws of Kansas has gone so far that while juries in the cities refuse to convict liquor sellers, even upon the clearest evidence, in Atchinson the Common Council, with the cooperation of its presiding officer, the Mayor, has adopted an ordinance providing for the granting of licences to taverns and saloons. This action was taken in express ridicule and defiance of the prohibitory constitutional amendment and the laws based upon it. The temperance men have since then had a mass meeting, and called upon the Mayor to resign, while Gov. St. John threatened to call out the militia and put the laws into execution by force of arms. All this because the population of the cities is not willing to be deprived of its beer by the rural population's temperance predilections.

President Garfield and General Grant have shaken hands and made some observations about the weather. The safety of the Republic is now assured.

A powder house in Tucson, Arizona, blew up Monday evening, breaking nearly every window in the town. It is reported that the county hospital was nearly demolished.

Secretary Lincoln has very properly ordered the removal of the saloons and dance-houses recently put up by white robbers on the Ute reservation in Colorado. That is a good piece of reform, for the Indian.

A thunder storm of unprecedented fury swept over Washington, D. C., on the 27th ult., commencing at 8 o'clock and lasting about an hour. While it continued it was a roar of wind and rain accompanied by blinding torrents of rain with occasional tempests of hail stones. Ford's Opera House, the City Hall building and a large number of residences were unroofed. Shade trees were prostrated and considerable damage done to the fire alarm and other telegraph wires in the city. Many cellars in the southern portion of the city were flooded. The extent of the damage done to property in the city and Georgetown is variously estimated at from $75,000 to $200,000.

A man drawing his wife in a wagon, trudged into St. Johnsbury, Vt., having played horse from Waterbury, 57 miles away, on a bet that he could do it in three days; he won by half a day.

In order to save about one hundred miles between Cincinnati and the northwest, the Cincinnati, Indianapolis, St. Louis and Chicago road is constructing a branch from its track at Kankakee to Seneca, on the Rock Island road, to be finished by September.

The largest blue stone ever shipped in this State will be sent this week by canal to W. H. Vanderbilt, to be laid in front of his residence in Fifth Avenue, New York. It measures 15 by 25 feet, is seven inches thick, and weighs twenty tons.

Professor Harkness, of the Naval Observatory at Washington, says that it is quite probable the earth passed through the tail of the comet on the 20th of June. This view tallies somewhat with that of the Kentucky astronomer Klein, and will go far to strengthen his view that the recent remarkable storms are due to this passage through the nebulous something which we call the tail.

The failures in the United States for the first six months in 1881 number 2,628, compared with 2,497 the first half of 1880. The liabilities for the first half were $40,000,000 compared with $32,000,000 in the same period in 1880.

At Po'keepsie, Thursday, on the Hudson River road, the axle of a freight car attached to the Canada Southern emigrant train bound north, broke and six loaded freight cars were dislodged and one went into the river. The emigrants were in the cars in the rear of the train none of which were dislodged.

Dr. W. H. Russell, the English journalist, says that the Yosemite is equal to the Alps and combines the attractions of half a dozen famous European places.

Fighting, begun between cattle men and renegade Indians in Colorado, has resulted in the murder of several officers and soldiers of the regular army. No very complete or intelligible account has yet been received.

New Hampshire now has a law taxing church property, the same as other property, when it exceeds $10,000 in value. A Congregational church in Manchester resisted payment, on the ground that the law was unconstitutional; but the highest court decides that it *is* constitutional. The New Hampshire example is like to prove contagious.

Silas Cutler, of Burlington, Mass., next to the oldest Postmaster in the United States, has resigned. He was appointed in 1832, and never received more than $40 a year. In his letter he states that, getting old and feeble, he desires to be relieved of the care of the office. As no one can be found willing to take the office for the same compensation, it has been discontinued

For the fifty-three cadets who graduated the other day at West Point, there are only forty vacancies, and the thirteen supernumeraries will be attached to the army as extra second lieutenants. If no regular appointment can be given them at the end of a year, however, they will be returned to private life.

Abraham Lincoln's mother is buried at Lincoln City, Ind., where her grave was visited the other day by a large party of citizens from Evansville. Several speeches were made beside the grave, many of Mr. Lincoln's old friends and neighbors giving personal reminiscences of the good man whom they called "Abe."

At the Chicago Sængerfest Ohio is represented by 16 societies, nine from Cincinnati, four from Cleveland, two from Columbus, and one from Dayton. Illinois sends 20, and all other states 17. The first concert of the Chicago Sængerfest took place on Wednesday evening. It was a marked success. Over 7,000 people were present.

During the past week Senator Sessions, A. D. Barber, E. R. Phelps and C. E. Edwards, the three last known in Albany as lobbyists, have been indicted on charge of bribery. Senator Sessions gave bail for $30,000, the others for $3,000 each. The event of the week, however, was the withdrawal of Platt from the contest and the consequent scattering of the Stalwart vote. This is believed to be the breaking of the deadlock and we may now look for an election before another week passes. The 32d ballot resulted, as concerns the most prominent candidates, as follows: Conkling, 28; Wheeler, 38; Potter (Dem.), 48, and Depew, 49; Crowley, 20; Cornell, 15; Kernan (Dem.), 48.

The past week has been a notable one for boat-racing. On the 28th ult. the Harvards beat Columbia, on the Thames river at New London, on the 30th the Harvard freshmen got away with Columbia's freshmen crew by three lengths and on July 1st the battle was fought again by Harvard and Yale, at New London, Yale winning by one and a half lengths. The Cornell crew has been doing some good work in boat racing on the London Thames, though they were defeated, by a foul of the Londons. The Thames crew won the first heat in the race for the Stewards' Cup, Londons second, Cornell, third. Cornell rows with the Hertford College crew, of Oxford, to-day.

"Thank God for Compound Oxygen."

This is a grateful utterance of the wife of a clergyman. Her letter, dated New City, Rockland County, New York, June 14th, 1880, thus states the condition of her husband when he began the Oxygen Treatment: "Rev. A. J. Conklin, Pastor New City and Centennial Churches, Newark Conference, was run down with overwork; voice injured, memory impaired, eyes very badly impaired, so that he could scarcely follow up general reading, much less study; throat affected, and the whole system in a bad state. He would have had to stop preaching had he not found help. I asked him this morning what I should say in reporting progress to you for him. 'Oh,' he says, '*tell them I am well. Never felt better in my life!*' This, on the minister's 'blue Monday,' *after preaching three times on a very hot day, administering the sacrament and baptismal service, and walking three miles afterward!* And now he is at work in his garden. *Thank God for Compound Oxygen!*" Our Treatise on Compound Oxygen, which gives full information about this remarkable remedy for Chronic Diseases, is sent free. Address Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

Eastern furniture manufacturers are seriously troubled at the scarcity of walnut lumber. Before the value of this wood as an article of commerce was understood, great quantities of it were needlessly destroyed, or used by farmers for the commonest purposes. Whole acres were burned for the purpose of clearing land, and it was turned into fence rails and hog troughs. They know better now, but there are few places where much of the wood is to be found. Indiana and Canada West, that were formerly the principal sources of supply, are almost denuded. There are, however, some promising tracts in the Southwestern States.

.....A few days ago the fine mare belonging to Senator Conkling, which he has driven about Washington for a year or two past, got caught in a barbed wire fence while she was out to pasture, and was very badly lacerated. In trying to extricate herself the mare pulled part of the fence down and twisted sections of the sharp wire around her body and received not less than twenty ugly cuts, extending from her head to her hind quarters on her right side. Some of the wounds were nearly two inches deep and will leave permanent scars.....It is officially announced that two million sheep were sheared in Michigan this year, yielding 10,974,163 pounds of wool, or about 5½ pounds each.....Com. Loring will deliver an address at the Wisconsin State Fair in September.

.....A telegram from Minnesota on June 30 puts the wheat area of that State last year at 3,000,000 acres, with a falling off, this year, of about 250,000 acres; but the aggregate yield is put at 45,000,000 bushels—an increase of 3,000,000 bushels over last year's crop... ....The twenty million cinchona trees planted in Ceylon in 1880 are expected to yield in six years ten million pounds each year, but it is believed that the demand will fully keep up with the supply, so that prices will not decline.

The Cuban sugar crop for the present year is estimated at 464,000 tons.....The Mark Lane Express of June 27, in its review of the British grain trade the past week, says: "A few white frosts have unfavorably influenced wheat blossom which is now general. There are no prospects of an abundant harvest. Whether an average yield is possible is now a question upon which grave doubts are entertained".....The latest mail European advices have the following crop reports.

Turkey—The recent rains have done much good to the cereal crops in general, which may be considered from now to be safe in Thessaly, as well as in Macedon and Eastern Roumelia. It is anticipated that the market of Salonica and adjacent ports will have large quantities of grain for export this year.

South Russia.—Stocks have been almost exhausted by local requirements as well as by the export trade. At present all are looking forward to the coming harvest for which the outlook is exceptionally good.

Levant.—The weather continues to be wet, which is quite unusual at this season of the year, and it naturally acts more or less prejudicial on harvesting operations. The quality of the new barley brought to market is fine, but it was damaged by rain. The samples received are heavy in weight, and it is very important that the weather should clear up.

Roumania.—Weather on the Danube is now hot, which is good for the country and the crops are well reported of.

CENSUS TABLE OF BUCKWHEAT.

Atchison	.....	130,632

The following comparisons of foreign exports of breadstuffs from leading customs districts of the United States for the month of May is compiled from a detailed statement furnished by the Chief of the Bureau of Statistics:—

	May, 1881.	May, 1880.
Wheat, bushels	8,958,253	9,732,376
Corn, bushels	7,286,263	9,930,836
Oats, bushels	22,186	72,871
Rye, bushels	45,489	188,698
Barley, bushels	14,471	23,775
Wheat flour, barrels	639,429	534,438
Corn-meal, barrels	39,666	37,168
Total value, above items	$13,804,575	$20,032,441

The general tenor of reports received by the Department of Agriculture as to the condition of live stock during May and up to June 27, is more encouraging than the reports for the month of April. At the same time the reports are not as encouraging by any means as they were at the same time last year. The severe Winter is the cause of the drawback this year. The worst reports are from the sheep. They show at this season a much poorer condition than for several years past. There is, however, a decided improvement since the April report. As to horses, there is no change worth noting over last year. From swine the reports are generally favorable. These reports are not, however, sufficiently full, as yet, to base a comparison on from the same time last year. The condition of cattle is good, with the usual run of diseases among them. Horses are in fair condition.....At a well-attended meeting of the Hereford cattle breeders, held at Chicago on June 27, the "American Hereford Cattle-Breeders' Association" was formed. Any breeder of Hereford cattle in good standing can become a member on application to the Secretary, and by paying a membership fee of $10, either for an individual or for a firm. The Association is to meet annually. The following officers were elected for the ensuing year: President—C. M. Culbertson. Vice-Presidents—A. H. Swan, W. H. Todd, W. Hamilton, R. W. Sample, G. S. Burleigh, B. Hershey, J. M. Studebaker, W. H. Sotham, A. H. Seabury, A. D. Raub, N. Abbe, M. Lee. Secretary—T. E. Miller. Treasurer—A. Earl. Auditing Committee—W. Powell, T. L. Miller, T. Clark. Directors—H. Norris, J. R. Price, C. Gudgell, J. Frank, G. F. Morgan, W. S. Van Netta, T. Clark, W. E. Campbell, T. L. Miller.....The complaint is general that but few eggs hatch the present season. Eggs are bringing more in the country than they have at any time during the summer for twelve years.

The parlor cattle cars from Cincinnati are a great success. It takes about eight minutes to put the cattle on board, and while on the trip the animals are fed twice a day and watered three times, a vast improvement on the old cruel system. Twenty fat oxen, for instance, weighing 1,500 pounds each, can go into a car thirty-four feet long, so that they can lie down comfortably. The car has been in operation for some months in Cincinnati, and it was found that in traveling a distance of nine hundred miles the cattle lost but 2¼ per cent. of flesh, while formerly they lost from 11 to 13 per cent.....A company in Tennessee are about establishing a pork-house, which will probably be the largest in the South. Grounds have been purchased near the western portion of Nashville, but the trustees of the Fiske University are opposing the enterprise, thinking it will be a nuisance.....

Great need of rain, both for pasturage and to fit

the ground for sowing grain crops, was felt in South Australia at date of last advices. Stock of all sorts were in fine, healthy condition, however.....In Buenos Ayres, S. A., sheep and cattle command very high prices, owing to the constant purchases for new estancias. Lands that were purchased from the Government three years ago at $10,000 a league are now being stocked by the owners, which has proved a surprise for that market, inasmuch as when these lands were subscribed for it was thought they would remain idle for at least 20 years; but the growth of the country is as rapid as in the United States, and, at the rate they are going on, all these Rio Negro lands will be stocked and settled on in less than 20 years. .....The Italian revenue increases steadily in spite of the late abolition of the grist tax..... Below is shown the acreage of wheat planted, the the total product in bushels of the harvest of 1879, and the average number of bushels per acre produced in nine States that produce seven-tenths of the wheat crop of the country. It is summarized from the census corrected to latest date:—

States	Acres.	Bushels.	Bushels per acre.
Illinois	3,218,963	51,135,455	15 9
Indiana	2,619,307	47,288,869	18 1
Ohio	2,656,134	46,014,869	18.0
Michigan	1,822,753	25,537,097	19.5

The second annual banquet of the Short-horn breeders of America will be held at Winchester, Ky., on the 26th inst. Mr. A. L. Hamilton, Winchester, manager.....A couple of men named McCall and Rice are swindling Missouri farmers on the sale of sickle grinders.....On the 22d inst. a a fire swept over 7,250 acres of wheat and other grain in Merced County, Cal., destroying everything in its course, including many farm houses and much farm machinery. The amount of the loss is not known.....It is now probable that France, Spain, Great Britain, Denmark, Sweden and Norway will continue to import wheat freely during July and August, taking from two and a-half to three million bushels per week from our Atlantic ports.

It Acts Sure and Safe:

The celebrated remedy Kidney-Wort can now be obtained in the usual dry vegetable form, or in liquid form. It is put up in the latter way for the especial convenience of those who cannot readily prepare it. It will be found very concentrated and will act with equal efficiency in either case.

Women that have been given up by their dearest friends as beyond help, have been permanently cured by the use of Lydia E. Pinkham's Vegetable Compound. It is a positive cure for all female complaints. Send to Mrs. Lydia E. Pinkham 233 Western Avenue, Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, billousness, etc. One-half to one lozenge is the dose. Price 25 and 60 cents per box.

Inaction of the Kidneys and Urinary organs cause the worst of diseases which Hop Bitters cures.

BURNETT'S COCOAINE.

Will Save the Hair

And keep it in a strong and healthy condition, because it will stimulate the roots of the hair, and restore the natural action upon which its growth depends.

Burnett's Flavoring Extracts are absolutely pure.

The Markets.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, July 2.

Chicago.—WHEAT unsettled; No. 2 Red Winter $1 12; No. 2 Chicago Spring, $1 10⅞, cash; $1 12⅞@$1 12⅝, August; $1 10⅞@1 10⅝, September; No. 3 do., 89c.@$1 04; Rejected, 77@86c. CORN active at 46c., cash; 45⅞@46c., July; 46⅛@46⅜c., August; 46⅞@47c., September; Rejected, 42½. OATS heavy for cash; 37⅛c., cash and July; 28⅜c., August; 27⅛c., September. RYE firm at 97c. PORK steady with a fair demand at $16 25, cash; $16 42½, August; $16 57½@16 60, September. Lard active, firm, and higher at $11 05, July; $11 85, August; $11 05, September. Bulkmeats fairly active and a shade higher; Shoulders, $6; Short Rib, $8 57½; Short Clear, $8 85. BUTTER firm; fair to fancy Creamery, 18@22½c.; fair to prime Dairy, 14@18c. CHEESE easy; full creams, 8@8¼c. EGGS dull at 13½@14c. Flax-seed firm at $1 22. HOGS—good quality active and 5c. higher than yesterday, mixed packing, $5 90@6; light, $5 90@6 20, mostly at $6 15@6 20; culls and light Yorkers, $5@5 50. CATTLE—Market active; all desirable grades stronger; no choice exports here, and quoted nominally $6 20@6 30; very fat Steers, $6 15; good to choice shipping, $5 75@6 10; common to fair, $5@$5 50; far West corn fed, $5 60@5 85; distillery fed, $5 40@5 65; native butchers' steady, but lower grades weak at $2 50@4 65; through grass Texans active and steady at $3 40@4 50; stockers and feeders steady at $3 20@5. SHEEP good, demand and market firm; common to medium, $3 75@4 50; choice to extra, $4 75@5 25.

Cincinnati.—WHEAT—No. 2 Red Winter, $1 20. CORN—No. 2 Mixed, 48½c. OATS dull; No. 2 Mixed, 39½c. RYE dull; No. 2, 98c. PORK firm at $16 50. Lard firm at $11 05@11 10. Bulk-meats firmer; Shoulders, $6 25; Clear Rib, $8 70. Bacon in fair demand and firm; Shoulders, $7; Clear Rib, $9 50; Clear Sides, $9 90. BUTTER in fair demand and firm; fancy Creamery, 23@24c.; choice Western Reserve, 16c.; choice Central Ohio, 14c. SUGAR quiet and unchanged. SHEEP—The receipts have been considerably smaller than last week, but the market was not very brisk, and prices have not changed essentially. Common to fair sheep sell at $2 40@3 50, good to choice at $3 75@4 25 ₱ 100 pounds, and a few extras at $4 50. The supply of Spring lambs has been much reduced, and prices of the better grades are higher; common to prime sell at $4@5 50 and extra $6@6 25. Receipts for the week 15,947, shipments 16 021. HOGS dull; common and light, $4 25@5 90, packing and butchers', $5 35@$6 15.

HEMP.—There is not much doing, but prices are well sustained. Rough Kentucky is held at $120@$125 per ton from store. Single dressed sell at 8c. and double do at 10c. per lb., from store. POTATOES—The arrivals are less liberal, and the market is firmer at full prices. Prime to choice Early Rose sell at $2 75@3 00 per bbl on track, and $3 10@3 25 from store. SEED.—There is only a moderate demand at previous prices. Clover is jobbing at 8c. per lb. Timothy at $2 85, and Hungarian Grass at $1 05@1 10 per bushel. ONIONS are in light supply and steady at $1 50@1 65 per bushel crate, and $8 50 per bbl.

St. Louis.—WHEAT No. 2 Red Fall, $1 17@1 18, cash; $1 14⅛@1 14⅞ July; $1 12@1.13⅛ August; $1 12⅛@1 13⅛ September; $1 13⅝@1 13⅞, October; $1.11⅛@1.12⅛ all the year; No 3 do., $1 09⅝; No. 4 do. $1 05⅛ bid. CORN 44⅜@45c. cash; 45c. July; 45⅛@46c., August; 46⅜@46⅝c., September; 46⅛@46⅝c., October; 41⅛@42c., all the year. OATS dull at 34⅜c. cash; 34c., July; 27c. August; 26⅝c., all the year. RYE dull at 85c. bid. PORK steady; jobbing at $16.75. Lard quiet at 11⅛c. Bulk-meats higher; shoulders $6 20; clear rib $8.60; clear sides $8.85. Bacon strong; shoulders 7c.; clear rib 9⅛c.; clear side 9⅜c. Cattle—native slow and weak; no urgency in the demand; grass cattle fally active for good grades; exporters $5.70@6.50; heavy shipping Steers, $5 40@5.75; light do. $4 80@5.40; native butchers' steers $4.25@5; good to choice grass Texans, $3 75@4 25; feeding steers $4.80@5.15; stockers $3.75@4.25. SHEEP scarce and wanted; fair to fancy range at $3@4.25 HOGS higher; Yorkers $5.80@5.90; packing $5.70@6; choice to fancy $6@6.25.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 2, 1881

The celebration of the Fourth interrupts the regular channel of commerce and for a few days, many lines of property will drift into merely nominal importance. The various exchanges were deserted today; many of them decided to adjourn for several days, and wholesale trading may be said to have ceased last evening. Perishable commodities are apt to suffer when holidays are prolonged and largely participated in. Here and there certain caterers require their full supplies, as the places of absentees are filled by visitors: but the hotel and restaurant wants are the main ones to be filled in this way. A favorable point to be noted since the Summer holiday has become extended of late years is the interior recognition of our reduced requirements, and receipts have been judiciously limited.

ALCOHOL—Nominal 3⅞c. for export.

BEANS AND PEAS.—There is no change in the bean trade. Current prices are marked off slightly, but it is possible that extra choice marks of white sorts are withheld for the time being. Green peas quiet at $1.10@1.55. Southern B. E. peas easier; $3.10 3.15 ₱ 2-bush. bag.

Marrow beans, prime, $2.40@2.45; other, $2.25@2.35; medium, prime, $2.40@2.42½; other, $2.20@2.35; pea, $2.25@2.50 white kidney, $2.40@2.45; red kidney, prime, $1.55@1.60; fair to good, $1.43@1.50; black or turtle soup $1.40@1.45.

Receipts for week, 6 351 bush.
Exports do. 913 pkgs.

BEESWAX—In export collections 23@24c.

BUTTER.—A repetition of last week's remarks on butter would quite explain what the situation has been this week. The speculative prices that rule are met very good-naturedly on the part of buyers and sellers of course are proportionately amiable. Prices are hardly as sharp as they were for upper grades but with the pause in regular trade occasioned by the holiday sellers generally quote as before.

Creamery—Western, good to prime, 21@22c.; State and Penn. 21½@23c.; poor to prime, 19½@20c.; sweet cream, 20@22c.; State pails and h'f tubs, choice, 21c.; fair to prime, 19@20c.; Welsh tubs, 19@21c.; poor State, 14@18c.; firkins yellow, 20@22c; Western imitation creamery, 16@20c.; dairy, 18@19c.; other, 14@17c.; factory or ladle-packed, best, 16@16½c.; other, 10@15c.; very poor Western, 10@11c.

Receipts for week, 48,700 pkgs.
Exports for week, 12,856 do.

CHEESE.—Exports have almost equaled receipts and the market closes with a good tone, though a shade off from last report. Shippers have only slightly reduced their bids on account of an easier cable, which is now quoted at 50s. Western stock is running low in quality and is freely offered at the prices. Skims have again started into use and they are fairly firm.

State factory, fine, colored, 9¾@10c. do. white, 9¾@9¾c; fair to prime, 8¾@9¾c; poor to fair, 7@8c.; Ohio, fine, 8½c; other 7@8c; Wisconsin poor to fine 7¾@9¾c; part skimmed, 4@6c.; full skims, 2@3c.

Receipts for week, 136,117 boxes.
Exports for week, 132,000 boxes.
Liverpool cable, 50s.
Steam to Liverpool, 15@25s.
Steam to London, 23s, 9d.@27s, 6d.

COTTON—The week has been featureless and, trade will not remove until the holiday is over. The Cotton Exchange adjourned until July 6th.

DRIED FRUITS.—Confidence is shown in evaporated apples by the fact that dealers prefer to colstore them instead of dropping prices to a point that would tend to increase trade. Sun-dried are quiet; a few cheap sales have been made for workmen's stores where railroads are being laid. Peaches are hardly in commercial quantity; almost any sound parcel is regarded as fancy stock. Small fruits quiet. We are too near new crops for much activity.

Apples evaporated choice 8¼@9c; fair to prime 7¾@8¼c. North Carolina sliced, common to best 4½@5c. Va, do. 4@4½c; Tenn in bbls. 4c, do bags 3¾@4c; State fine cut 3¾@4c., quarters 4¼c. Western, 3¾@4¼c; evaporated peaches peeled 27@30c.; unpeeled 13@14c; sun-dried peeled 17@22c; unpeeled halves 5@5½c. Plums 12@12½c. Blackberries 8c. Cherries 13@14c. Raspberries 23@24c. Whortleberries 11½c.

Receipts for the week, all kinds, 412 pkgs.
Exports dried apples, 2,426 pkgs.

EGGS—Receipts for week, ... bbls.; do. last week 1,329 do. Just as soon as hot weather set in sellers lost no time in following the lower views of buyers, and if receipts were in any way unwieldy the drop in prices would be more marked. Fourth of July brings out some trade and dealers will use it to keep down stock

Near points, 16½@17c.; State and Pa., 15½@16½c.; Western, choice, 15c.; Canadian, 15@15½c.; second quality, 13@14¼c.

FLOUR.—The marked tendency to lower prices in wheat has had a positive effect upon flour and prices rule weak at the close.

No. 2, ₱ bbl., $3.00@3 60; State and Western superfine, $4 00@4 50. city mills extra, $6.25@6 50; Spring wheat do. $4.75@5.10; Spring XX and XXX, $5.25@7.00; patents, $6.00@8; Ohio round hoop shipping, $4.80@5.20; trade brands, $5.40@6.25; St. Louis extra, $4.90@5.50, do. double extra, $5.75@6 25; do. family, $6.40@7.25; South'n shipping, $5.30@5.60; do. XX and family, $6.25@7.50. Rye, $5.30@5.70. Corn-meal, Brandywine, $3.35@3.40; Western, $2 90@3.35.

Receipts of flour for week, 103,140 bbls.
Exports of flour, 64 450 bbls.

FRESH FRUITS.—Strawberries are not much of a feature: most of them arrive too soft to be attractive. Principal supply from Oswego quoted 6@9c. ₱ qt.; river Downings, 6@10c.; seedlings, 3@8c. Raspberries begin to arrive freely and will sell well when prices become popular. Antwerp caps 6@7c.; natives 3@4c.; Brandywines, 4@5c.; black Caps, 6@7c. ₱ qt. Whortleberries, $3@4 ₱ bush. Blackberries, Wilson, 14@16c.; wild, 5@6c. Cherries in good supply, but have to be sold quickly, as the weather is warm: fancy, 10@12c.; good to prime, 6@8c.; other, 3@5c.; a few Rochesters bring 6@8c. Currants dull: small, 4@5c.; Cherry, 7@8c. Peaches scarce and salable when at all in good order; Ga. ½-peck crates 50@75c.; do. ½-bush. do. $1.25@1.50; South Carolina, $3@4 ₱ bush. Ga. Wild Goose plums $2 ₱ ½ bush. Gooseberries, small, $1. Md. apples 50@75c. Fla., Ga. and Texas watermelons $35@40 ₱ 100. Peanuts active; Va. hand-picked, 4½@5c. ₱ lb.; fancy, 4¼@4½c; extra prime, 4¼@4¼c.; good to prime, 3½@4c.; shelled, 2½@3c.; pecans, 7@10c.

GRAIN.—With large crop estimates wheat has been declining most of the week. Deliveries have been large and large spot and other business have been settled for the end of the month at the new prices. Corn has held a good export situation: at the close prices favor buyers. Oats, as before, show the usual easy rates of Summer. Rye dull. Barley and malt quiet.

Wheat, Spring $1.05@1.24; do. No. 2 $1.21@1.23; do No. 3, $1.12@1 14; red Winter No. 2, $1.27½@1.28; red Winter $1.15@1.32 white Western and State $1.18@1.27. Rye, $1.01@1.08. Oats, white No. 1, 47c.; white No. 2, 44½@44½c.; white No. 3 43½@43c; mixed No. 1, 44½c; do, No. 2 44@44½c; do. No. 3 41@43c. Corn, West'n mixed 48@48½c.; do. No. 3 55@56c.; do. do. yellow 56@57c; do, do. white 57@60c; Southern yellow 57@59c.; do. white 57@62c.

Receipts for week, wheat, bush., 944 800; corn, do. 1,345,200; oats do. 312,200; rye, do. 3,647; malt, do. 63,700; rice pkgs. 831.

Exports for week, wheat, bush 1,167,850; corn, do. 1,000,000; oats, do. 3,703; rice, pkgs. 96.

HAY AND STRAW.—The market is slow and prices are low. Few buyers operate heavily or freely while the risk of Fourth of July combustibles exists. Quality continues to rule poor and good new crop will be hailed with satisfaction when it appears.

Choice retailing timothy hay 85@90c. ₱ 100 lbs.; second quality, 60@65c. do.; shipping 45@55c. do.; clover 40@50c; Long rye straw 80@90c. ₱ 100 lbs.; short do. 60@70c.; do. other grain, 45@50c. do.

HOPS.—The movement for all uses is very light, and there is no encouraging outlook at the moment. Few choice hops here. Cal. hops quoted 18@22c.; Wis. 15@22c.; State as follows:—

Crop of '80 choice,—@—c; good to prime 20@23c; fair to good, 18@20c, poor to fair, 13@16c; Eastern, 15@20c.; '79's, fair to prime, 12@15c.; olds, 4@12c.

Receipts for week, 733 bales.
Exports for week, 155 bales.

LEATHER.—The market is well sustained, showing no important change, and demand moderately active. The quotations are for

MILK.—June has been a ruinous month for wholesale dealers and farmers or shippers have also suffered severe losses owing to the heavy supplies and light use. The average price at Harlem R. R. platform for commission milk $1.14 per can of 40 quarts with a range of $1@1.50.

POULTRY AND GAME—The weather has improved for the sale of chickens and prices are low enough to open a steady trade. Many will be wanted if the weather holds for steamboat and near-by watering ing place supplies. Turkeys have a fair sale. Choice Spring ducks have a good call and prime fowls sell well; in fact a scanty game market helps the trade in fine poultry to a marked degree.

Turkeys, choice ₱ lb 14@16c. coarse 12@13c; scalded, 12@13c.; Phila. Spring chickens 25@30c; New Jersey, 23@27c; fowls, Phila. d.-p. 16c.; N. J. d.-p. 13@14c.; do. scalded 14c. State and Western 13@14c; do. d.-p. 14@15c.; coarse 12@12½c.; roosters 8@9c; Ducks, Spring, 14@20c.; old 10@13c.; Squabs, white, ₱ doz. $2.50@2.75, do. dark, $1.50@2.

Supplies of live have exceeded wants and prices are easy.

Spring chickens prime ₱ lb 22@23c.; other 16@20c. Fowls, ₱ lb, 12@13c; roosters, 5@6c.; turkeys, 11@12c.; ducks, ₱ pair 40@50; geese, extra $1.75; other $1@$1.50 pigeons, 25@45c

Game is of no quantity account. The wild pigeon trade has been fairly supplied by the shooting matches, birds bringing $1.35@1.50; a few selected $2@2.25 ₱ doz. Eng. snipe, $2@2.50; Plover, $1.75@2 sand snipe 50c; frogs' legs 15@20c.

PROVISIONS.—Stocks are unimportant trading mainly of a speculative or "cornering" character, especially in lard. A fair export demand may be noted for pork.

RICE. Domestic quoted at 5 to 7¾c. common to choice.

SUGAR—

Hard sugars—crushed ₱ lb 10¼c; do. powdered 10¼c.; do granulated 10¼c; do. cut loaf 10¾c; confectioners' "A" 9¾c; coffee "A" standard 9¾@9¾c; do. off "A" 9¾@9.41c white extra "C" 9@9¾c; extra "C" 8¾@8¾c; "C" 8@8¾c; yellow 7¾@7¾c.

VEGETABLES.—Potatoes lower. Bermuda down to $2.50@3. All South-ern $1.50@2.50; for prime and 50@75c. for culls to fair. Old potatoes dull and weak bulk prices $1@1.20 per bbl. for double heads add 2 c. Long Island peas plenty. Garden truck sells well; quality now in buyers favor.

String beans L. I. ₱ bag $1.75@2; N'k.r'd ₱ ½ bbl cr. 75c, flat do 50c.; wax $1. Green peas, L. I., ₱ bag, 75c.@$1; cucumbers Norfolk, ₱ ½ bbl. crate, $2.25@2.50 Chas. $1@1.75; asparagus, Oyster Bay ₱ doz., $1.50@2. Shrewsbury $1.50@1.75; onions, Md. ₱ bbl. $2.75@3; Bermuda ₱ crate, 25@75c. Tomatoes Sav. fancy $2@2.50. Chas & Sav. ₱ crate 50@$1; Fla. ₱ bushel crate $1@1.25; squash Norfolk ₱ crate 50@$1; radishes L. I. 50@75c; cabbages, Norfolk ₱ bbl. 75c.@$1; do. L. I., ₱ 100, $2.50@4 beets, L. I. ₱100 bchs., $1@1 50 turnips Rus-ia ₱ bbl. 75c.@$1; white turnips L. I. ₱ 100 bchs $2@3 rhubarb do, 50@75c; spinach L. I. ₱ bbl. 75c@$1; cauliflower, ₱ doz., 50c@$2.

WOOL.—The contest is warm in the endeavor to secure stock and with prices relatively higher in the country than here; quotations keep their recent upward movement.

LIVE STOCK MARKETS.

NEW YORK, Saturday July 2, 1881

BEEVES.—Receipts for the week 12 530 head; do last week 13,905 do. The jubilant feeling that pervades most business circles on the eve of a holiday extends to the cattle yards. Butchers, who are proverbially a patriotic class, seemed determined that their "Fourth" should not be broken into by a visit to the yards on Monday next, and good-naturedly cleared out the stock early yesterday without haggling over the advanced prices. Receipts have been light and the fact favored the stronger views of sellers. The transactions included a car-load of pure Texans at 8¾c. to dress 55 lbs.; 18 car-loads, Ky., O. and Ill stillers 9¾@11¾c., to dress 56 lbs.; 3 cars Col. do. 10¾c., 50c. added. Poor to choice native steers 9¾@12c., to dress 56@57 lbs. Small bulls 3½@4c. live weight; 4½@5c. for a better grade.

VEAL CALVES.—Market dull; stock larger than wanted.

Live N. J. prime to choice, 7¾@7¾c; do, State, 7¾@7¾c.; poor to good 5½@7¼c.; Mt. Hollys, 6¾@7¾c.; buttermilk, 3¾@3¾c.; up-river, dressed, 10@11¾c

MILCH COWS.—With small receipts a better range is ruling: $30@55 per head has been easily quoted the market closing strong.

SHEEP AND LAMBS.—Receipts for the week 26,237 head do. last week, 32,928 do. With light receipts the market has run well at good prices. Common to prime sheep 4½@5c; Va. and Ky. lambs 6¾@8¾, ₱ lb; Penn, 9.30@9 50 ₱ 100 lbs.; N. J. 9¾@9¾c. ₱ lb.

SWINE.—Receipts for the week 23 253 head; do. last week 25,371 do. Live nominal at $5 30@6 30 per 100 lbs. City dressed State, 8@8½c.; do. Western 8@8¼c.

We have handled several brands of salt and have finally settled upon the Higgin's Eureka Salt as the best. We use it in all our creameries and sell it to our trade. J. H. BROWN.

Wellsville, N. Y., March 2, 1881.

FARMING FOR BOYS AND GIRLS—NO. 27.

HENRY STEWART.

Value of Different Foods.

MARKET prices are based on real values in a great measure. If a ton of straw sells for five dollars and a ton of hay for ten, it is because the hay is twice as good for feeding as the straw. But if a dollar's worth of corn-meal be added to a ton of straw and the two are fed in place of a ton of hay, and the hay is sold, there is a clear profit of four dollars. This is an example of the whole business of selecting and using foods for cattle. A great number of experiments have been made to discover the real value of different kinds of cattle food and many years of study have been given to this subject by chemists, so that we have in a small compass the results of all these years of labor. In the following table are given the money values of the different substances named as compared with good hay at one dollar per 100 pounds. That is, hay is worth one dollar per 100 pounds, or one cent a pound, or twenty dollars a ton, to feed, when each of the other substances is worth the sum set against it in the column:—

Table of the Values of Feeding Substances.

Kind of fodder.	Value.
GREEN FODDER.	
Corn-stalks	$0 20
Oats	23
Red Clover	26
Peas in blossom	27
Rye	31
Hungarian Grass	31
Mixed grass	34
Timothy Grass	42
DRY FODDER.	
Poor hay	74
Good hay	1 00
Hungarian hay	1 04
Rye fodder	1 15
Peas cut in bloom	1 21
Best clover hay	1 39
STRAW.	
Rye	55
Wheat	57
Corn-stalks	61
Oat	69
Pea	69
ROOTS.	
Turnips	16
Beets	22
Carrots	24
Ruta-bagas	24
Parsnips	28
Sugar beets	30
Potatoes	46
GRAINS.	
Buckwheat	1 19
Oats	1 63
Rye	1 68
Corn	1 73
Peas	2 25
Beans	2 36
Cotton seed	3 24
Linseed	3 85
MANUFACTURED PRODUCTS.	
Whey	18
Corn-starch waste	24
Buttermilk	35
Skim milk	36
Brewers' grains	47
Corn bran	1 42
Wheat bran	1 63
Rye bran	1 73
Whole cotton-seed cake	1 75
Buckwheat bran	1 79
Rice meal	1 80
Linseed cake meal	2 51
Hulled cotton-seed cake	3 22

This long list is worth studying, and is very useful. From it we can learn the actual value to us of any one of the substances mentioned, and by choosing those which have a higher value in this list and a lower value in the market, money can be saved. And money saved is twice earned, because we earn it without working for it, and have it, while we have the profit from our labor at the same time. Let us suppose a case in which we can turn this list to a useful purpose. A farmer's boy is told to pour out a quantity of buttermilk where it will be wasted and lost. He dislikes to do this, and, looking over the list, he sees it is worth 35 cents per 100 pounds, or three-quarters of a cent a quart. He therefore invests $2 in buying a small pig, and instead of wasting the milk in the future he puts it into a barrel for his pig. He looks over the list again for something to mix with this milk and sees wheat bran is worth $1 63 per 100 pounds. He can buy 100 pounds for a dollar, and he gets a bag of it and feeds it to his pig with the waste milk; 100 quarts of buttermilk and 50 pounds of bran will feed his pig for a month, and in that time it will gain 30 or 40 pounds in weight. The food is worth $1.20 and the pig is worth $2. If he buys the food he has made a profit of 80 cents for his labor, and has a quantity of manure that is worth 10 or 20 cents besides. Here is the benefit of knowing something about the value of feeding substances, and it is a knowledge upon which the business of farming depends more than farmers are apt to believe.

THE SPINED SOLDIER BUG.
(Arma Spinosa.)

As destructive as most of the insects are to vegetation, there are some, such as the Soldier Bug, the Fiery Ground Beetle (Calosama calidum), the Camel Cricket (Mantis Carolina), the Lace-wing Fly (Chrysopa) and the Ladybird (Hippodamia maculata), which are the horticulturists' friends and should receive their protection. My young friends have probably often seen the Soldier Bug, shown at Fig. 333. It is a dull olive, marked with yellow and is frequently mistaken for the squash bug from which it may be distinguished by the opaque, brown streak at the tip of its wing cases. Now, boys, don't kill the little fellow the next time you see him! Let him alone! He is said to have saved thousands of dollars to the country by stabbing with his little "sword" countless hosts of our great enemy, the Potato Beetle. Its sting or beak lies close under its body when not in use, but when it attacks its prey it pierces the body, sucks out the juices and throws away the empty skin. We can afford to put up with its somewhat unpleasant odor when we consider its services in destroying our insect enemies. We have all read of the wonderful strength of the lion but here we have an illustration of a little insect whose muscular power is, proportionate to its size, much greater than that of the lion. The Soldier Bug can run nimbly along bearing on its outstretched

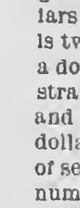

FIG. 333.

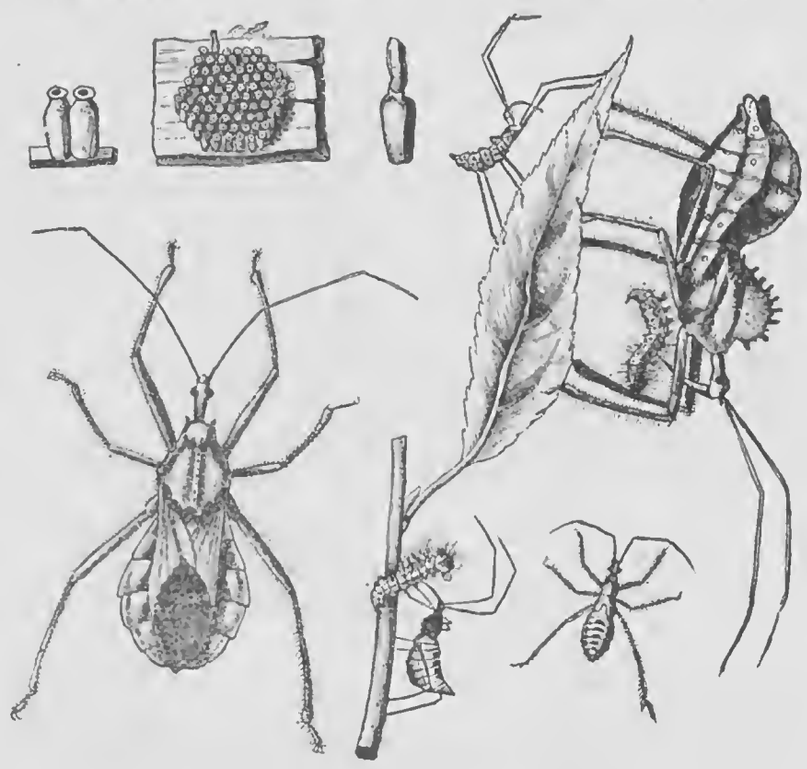

FIG. 334.

beak the larva of a potato beetle four times its own size.

THE DEVIL'S HORSE (Prionotus cristatus) Fig. 334 is another beneficial insect, though its name would lead us to think differently. In the cut at the left this insect is represented, just above it is a cluster of the eggs, which are deposited on the bark of trees, on fence rails, etc., each when separated, presenting the appearance of a little flask as shown at the left hand, upper corner, while on the right the insect is represented in the act of stinging a cotton worm. They destroy large numbers of plant lice, caterpillars and, in fact, any other insects they can overpower. They insert their proboscis or sting into the insect and then inject into the wound a powerful poisonous fluid. The victim dies, they suck the juice out and drop the empty skin. It is said that a dozen or so of these insects placed near the nests of caterpillars which infest our fruit trees will destroy almost every caterpillar in a short time. They do not object to stinging persons also, and the adults need to be "handled with care." Their sting is much more powerful than that of the wasp or hornet. The adult insect is of a gray color and on the crest of the thorax are nine cog-like protuberances or teeth which have given it the name—nine-pronged wheel-bug (Reduvius novenarius).

So we see that some of the little insects which we are apt to tread upon heedlessly, have been created for a good purpose and that, too, to assist the farmer and gardener in their work.

UNCLE MARK.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—Since you published my letter about our big chimney I have been receiving letters from different persons asking me to tell them more about it, and one wanted us to lend him the old history that I wrote about, and wanted us to send it to him in Kentucky so that he may read the particulars about Captain John Smith, who was one of his ancestors; but we cannot spare the book, as it is quite torn now, and is only valuable on account of its giving a more particular account of this place (Werewocomica) and about Captain Smith sending masons to build a chimney for Powhattan. I do not think our friend could gain any more information about Captain Smith from that than he could from any History of the United States. If our friends, who seem interested, will come on to Yorktown next October to the Centennial Celebration, they can take a sail across the river from there to this place, and not only see the chimney, but they may have the pleasure of eating some of the oysters from the ancient Werewocomica Bay that may be cooked in the fire-place of that same old chimney. We will be pleased to see all of our RURAL friends here at that time. I expect brother Bernard and myself will be large enough by that time to wait on you all while you are eating.

Hayes' Store, Va. CLAUDE JEVIN.

UNCLE MARK:—I received the seeds which you sent and thank you for them. I did not expect any this Spring, as I had neglected to give any report of my last year's garden. My seeds all came up and did nicely. I had some of my China Pink Seed left and planted them in the hot-bed this Spring; some of them have come up. We have two callas, two varieties of geraniums, two of double petunias, oxalis, Chinese Primroses, pink and white, striped carnation, and othonna in bloom and others budded. My calla has not done very well this Winter; we think it is in too large a jar. We have six windows occupied with flowers. I have a little brother five years old and a little sister two years and a half old. They both like flowers. Willie says he is going to have a garden this year.

EDITH A. HUNT.

Chagrin Falls, Ohio.

Ague, biliousness, drowsiness, jaundice and rheumatism, Hop Bitters removes easily.—*Adv.*

The Literary Revolution.

To keep in good humor the good people who delight in good books; to wake up the slow booksellers who are inclined to go to sleep in the summer, instead of, like a 'possum, in the winter; and to prevent our friends, the book publishers, from forgetting us, we have concluded to publish a few more cheap books. If we are to name him at all, we must, of course, head the list with the immortal Shakespeare, and will give you either his "Merchant of Venice" or "Hamlet," or any one of his fourteen other principal plays, in beautiful type, for 3 cents. At the same price you may have Macaulay's "Life of Frederick the Great," former price $1.25, or Carlyle's "Robert Burns," or Lamartine's "Life of Mary Queen of Scots," or Thomas Hughes's "Manliness of Christ." Washington Irving's wonderful, delightful, heretofore inaccessible "Sketch Book," which contains the incomparable Rip Van Winkle, you can have for a dime. For the same price we will give you "Tom Brown at Rugby," the best boy's book ever written, except "Robinson Crusoe," which you can have also for 10 cents. To charm those who delight in fiction, we give also for 10 cents each, Cooper's "Last of the Mohicans," one of the most justly celebrated American novels, and Charles Kingsley's "Hypatia," which worthily ranks at the very front of famous historical fiction. These are only specimens of the cheap books we publish, are all in good type, neatly printed, and are not in the broad side or any other "side" or "square" style, but handy pocket volumes, of course in paper binding. Our motto, however, has always been that a book worth reading is worth preserving, as well as worth owning, and our large list of standard books, to which we are making additions, with speed unprecedented in the history of publishing, are all elegantly and strongly bound, in cloth or better style, and sold at prices proportionately low with those in paper covers. We issue these few only in pamphlet form, as specimens of the quality of our good literature, and these special terms will not be long continued throughout the United States and Canada are prepared to either abundantly supply or liberally slander our publications. We give liberal terms to clubs where no bookseller acts as agent. Descriptive Catalogue, and illustrated pamphlet describing book-making and type-setting by steam, will be sent free, on request. 5,000 Booksellers AMERICAN BOOK EXCHANGE, 764 Broadway, New York. JOHN B. ALDEN, Manager.

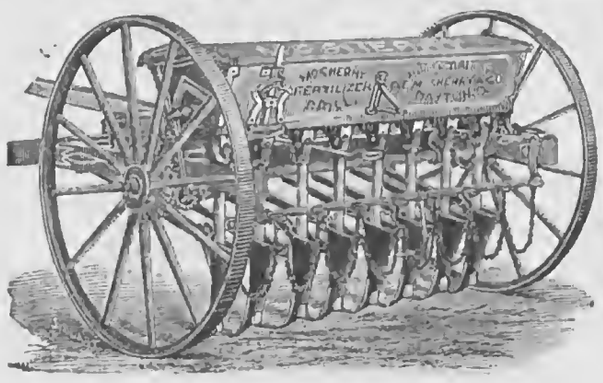
McSHERRY GRAIN DRILL.



UNQUESTIONABLY THE BEST
Sows Fertilizers Splendidly,
It is very Accurate,
It Regulates by Cog Wheels,
It is Light Draft,
It is Easily Managed
It is strictly first-class in workmanship and construction. Works to the entire satisfaction of everybody who knows what a grain and fertilizer drill ought to do. Its sterling qualities have gained it a world wide reputation, and all who appreciate excellence and accuracy, prefer the McSHERRY. Send for pamphlet. ☞ Mention this paper.
D. E. McSHERRY & CO., Dayton, Ohio, U. S. A.

PERSONAL ITEMS.

Hon. J. C. Pope, Canadian Minister of Marine and Fisheries, is reported to be so seriously ill that his recovery is not expected.

Ex-Gov. Bishop, of Ohio, brought suit against the Gazette, of Cincinnati, for libel, in accusing him of sharp practice in the manipulation of several State Commissions in the interest of his party. The jury reduces the amount claimed by the ex-Governor from $60,000 to $500.

Mr. Henry G. Vennor, the weather prophet, has a handsome mustache; he parts his hair in the middle, and he is forty-one years old. His early life in Canada was spent in poverty. In the University of Montreal he is a professor, and he is the author of a book called "Our Birds of Prey."

Prince Alessandro Torlonia of Rome believes in practical charity. He keeps two doctors especially to attend to poor families who have a horror of hospitals; he entirely provides for 300 children, and educates 350 more; and he has established an asylum for old people and a hospital for the blind. Every day he gives 120 dishes of soup, with bread and meat. It is said that no one has ever applied to him in vain.

[Nashville Daily News.]

Terrible.

Such is the term Mr. C. W. Purcell, of the National Stock Yards, Chicago, Ill., applies to his sufferings. He says: "I, for one, wish to speak a word of praise for St. Jacobs Oil. I suffered with a pain in my shoulder and arm for some six months and at times it was terrible. One bottle of St. Jacobs Oil, however, cured me thoroughly." —*Adv.*

THE CYCLOPÆDIA WAR.

The month of July, 1881, witnesses the completion of the larges and most important literary work this country and the century have seen. It is the Library of Universal Knowledge, large type edition in 15 large octavo volumes, containg 10 per cent. more matter than Appleton's Cyclopædia, at less than one-fifth its cost, and 20 per cent. more than Johnson's Cyclopædia, at a little more than one-fourth its cost.

Chambers's Encyclopædia, which forms the basis of the Library of Universal Knowledge (the last London edition of 1880 being reprinted verbatim as a portion of its contents), is the laborious product of the ripest British and European scholarship. It has developed through a century of Cyclopædia making, its various editions having been many times revised, in successive years, till it has come to be universally recognized, by those competent to judge, as standing at the very front of great aggregations of knowledge, and better adapted than any other Cyclopædia for popular use. It contains such full and important information as the ordinary reader, or the careful student, is likely to seek, upon about 2,500 subjects, in every department of human knowledge. Chambers's Encyclopædia, however, is a foreign production, edited and published for a foreign market, and could not be expected to give as much prominence to American topics as American readers might desire. To supply these and other deficiencies a large corps of American editors and writers have added important articles upon about 15,000 topics, covering the entire field of human knowledge, bringing the whole number of titles under one alphabetical arrangement to about 40,000. Thus the work is thoroughly Americanized, and the Library of Universal Knowledge becomes at once the latest and most complete Encyclopædia in the field, at a mere fraction of the cost of any similar work which has preceded it.

Victory **For The** **Revolution** **To Club Agents.**

Price of the 15 volumes, complete, in extra cloth binding, $15.00. In half Russia, sprinkled edges, $20.00. In half Russia, gilt top, $22 50. In full library sheep, marbled edges, $25.00.

The superlative value and importance of this great Encyclopædia lies especially in the fact that is is brought within the reach of every one who aspires after knowledge and culture. It is *really* a library of universal knowledge. It brings a liberal education easily within the reach even of every plowboy of the country and apprentice boy of the city. Every farmer and every mechanic in the land owes it to himself and to his children that such a Cyclopædia shall henceforward form a part of the outfit of his home. To the professional man, and every person of intelligence in every walk of life, a Cyclopædia is *a necessity.*

Of course the old and wealthy publishers who have grown rich (it is said that the Appletons have made a profit of nearly two million dollars on their Cyclopædia) from the sale of their high-priced publications are not pleased that their monopolies are broken and their power overthrown. Of course the book agents and booksellers who have been used to getting from 40 to 60 per cent. commission for selling these high-priced books are not so well pleased to sell the Library of Universal Knowledge on 15 per cent. commission, though those who are not short-sighted discover that their own interests, after all, are identical with the interests of *the people*, and their real profits, in the end, are increased, by the immense sales which result from meeting the people's wants. The majority of booksellers, however, are better pleased to *slander* than to *sell* this and our numerous other standard and incomparably low-priced publications. But the Literary Revolution has always looked to *the people*, in whose interest it is, for its patronage, and it has never looked in vain, as our more than one million volumes printed last year (this year being increased to probably more than two millions) abundantly prove. You can order the Cyclopædias directly from us, and by uniting with your neighbors and friends you can secure club rates as follows:

$10,000 Reward

A discount of 10 per cent. will be allowed to any one ordering at one time three or more sets of the Cyclopædia; and a discount of 15 per cent. will be allowed to any one ordering five or more sets at one time.

As a special inducement to our friends and patrons to go to work *promptly* and *vigorously*, each doing what he can for the dissemination of universal knowledge, we propose to distribute $10,000 in special premiums as follows, in addition to the regular discount to clubs:

$5,000 Reward to be distributed equally among the first 500 club agents who send us clubs of not less than five subscribers, after June 15th and before September 1st.

$5,000 Reward In addition to the first $5,000 to be distributed among the 100 club agents who, during the same time, send to us the *largest number of subscribers*, not less than twenty in number the amount to be distributed proportionately to the whole number of subscribers which each of the 100 club agents may send us.

The names of the subscribers must in every case be forwarded to us. The first $5,000 named will be distributed as specified as rapidly as the orders are received, and the remaining $5,000 will be distributed promptly on Sept. 1st. The names of the persons receiving these rewards will be printed, with the amounts received by each, and the list sent to all the club agents entering into competition for them. Subscribers must be *actual purchasers for individual use*, to entitle the club agent to the rewards under this offer, and not booksellers or agents who buy to sell again.

Persons desiring to raise clubs may send to us at once for sample volumes, if they desire, in the various styles of binding, paying us 75 cents for the volume in cloth, $1.00 for the volume in half Russia, sprinkled edges, and $1.25 for the volume in library sheep. Orders for the full sets will be filled by us with the utmost promptness, within our ability to manufacture, beginning not later than July 10th, orders being filled in the order of their receipt by us.

Specimen pages of the "Library of Universal Knowledge" will be sent free upon request. Descriptive catalogue of our large list of standard publications, with terms to clubs, and illustrated pamphlet describing book-making and type-setting by steam, will be sent upon application. Remit by bank draft, money order, registered letter, or by express. Fractions of $1.00 may be sent in postage-stamps.

NEW BUCKEYE PLOW SULKY.

IMPROVED FOR 1881.

CAN BE ATTACHED TO ANY PLOW

The **New Buckeye Plow Sulky** has many improvements not found in any other. It is simple in construction, is strong and durable, and easily operated by man or boy. It is easily attached to any common Plow with wood or iron beam. It has a convenient adjusting lever with which the plow is made to run level on uneven ground. The Lifting Lever is easily operated, and the depth can be regulated or the Plow raised entirely out of the ground without stopping the team.

It is arranged for either two or three horses, and will turn a square corner without raising the Plow. It is the best Plow Sulky in the market, and contains advantages not found in any other.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

Humorous.

A THREE YEAR old discovered the neighbor's hens in her yard scratching. In a most indignant tone she reported to her mother that Mr. Smith's hens were "wiping their feet on our grass."—Newport News.

"WHAT is the meaning of the word tantalizing?" asked the teacher. "Please, marm," spoke up little Johnny Holcomb. "it means a circus procession passing the school house and the scholars not allowed to look out."

"THE milk is pretty blue, landlord." "Don't understand it, sir; my cow is well fed, I milk her myself, and I don't put water in the milk." "Well, the weather has been quite wet, and I reckon the cow needs shingling; that's about it."

LAST Summer she was eating green corn by gnawing it from a cob, when her teeth became entangled with a corn silk. "Oh dear!" said she impatiently, "I wish when they get the corn made they would pull out the basting-threads."—Live Stock Record.

A GENTLEMAN in New York met a rather "uncertain" acquaintance the other day, when the latter said: "I'm a little short, and would like to ask you a conundrum in mental arithmetic." "Proceed," observed the gentleman. "Well," said the "short" man, "suppose you had ten dollars in your pocket, and I should ask you for five dollars, how much would remain?" "Ten dollars," was the prompt answer.

A HYBRID BETWEEN A PEAR AND AN APPLE. (?)

A considerable time ago we received a letter from Mr. Hubbard accompanying a box of queer-looking apples, which he explained were, as he believed, hybrids between a pear and an apple. Mr. Hubbard's letter lead to a further correspondence. With this note of explanation the following reply explains itself:

MASON CO., MICH.

"I can do no better in reply to your questions, than by stating what I know respecting the origin of the fruit. My note book runs thus, 'May 20, 1864, one Swaar blossomed; anthers carefully removed; replaced with indigenous crab (*Pyrus coronaria*) [prophetic note—*sure failure.*]. Oct. 17, 1864, picked one apple from experimental tree having "plump seeds." Of these—all of which were placed in the ground—one germinated and survived, from which, as soon as was practicable, a bud was taken and inserted in the bough of a bearing tree. In the Spring of 1879, a few bunches of fruit buds were observed upon this, and on their opening, their anthers were soon removed and those of a pear which was labeled Des Nonnes, were substituted. The bough thus treated matured several apples having nearly the form and the flavor of the Swaar, though slightly acid and astringent, and of a dull, greenish color. Some of this fruit contained plump seeds, which were planted and the resulting seedlings are now in the Hubbard orchard, and some of them have borne fruit, the little stranger which I now send you being from one of them.

And now friend, Editor, I shall not censure your readers for criticising this report, and even insinuating that the fruit is the common apple grown in ingeniously contrived molds—some nutmeg invention designed to deceive. I shall not respond cynically if they pronounce the whole thing a myth and deny the existence of such a cross or form of fruit. Were our positions reversed I might do the same thing. You will observe in some of these apples a rudimentary neck, also a deflection in the stem, as if the supporting juices had discovered their unnatural mission and sought by revulsive energy to change their ultimate destiny. JOSEPH HUBBARD.

In another letter Mr. Hubbard writes us that the tree is upright, spreading and a strong grower. The leaves are long, narrow, pendulous, finely serrate, of a light green color, with long, slender petioles. The fruit, as will be seen, is roundish-ovate, having neither basin nor cavity. The stem is long and rather slender, usually with a projection as if, in part, two stems were joined together. The color is a bright straw, splashed or blotched with a brilliant red. The flesh is white, fine-grained, with a rich flavor, somewhat like that of the Swaar and an aroma more powerful than that of any other apple we have seen. One apple perfumes a room in five minutes. The skin is hard, tough, and thick.

Horticultural.

THE SMALL-FRUIT NUMBER.

T. T. LYON.

RE-READING my remark respecting Crescent Seedling and Wilson Strawberries, that "neither can ever become popular with the best growers," and considering it in the light of Dr. Hoskins's remarks upon these varieties in the same number, it occurs to me that I may have said too little to convey just the idea intended; which is that the most thoroughly effective culture and handling, resulting in offering the product in the best markets and in the best condition, can never with either the Wilson or the Crescent yield as desirable and profitable results as may, with similar treatment, be realized from the use of some other varieties.

The introducers of novelties seem too often to entertain the notion that it is necessary to attach the word seedling to the names of their productions, as though they could, by possibility, be any thing else than seedlings. I take occasion to protest against the practice as always cumbrous and unnecessary, and to urge that we be vouchsafed the warrant of the horticultural authorities of the world for lopping it off whenever and wherever we shall find it attached to the name of plant, tree or fruit. Instead of doing this haltingly and in partial defiance of *law*, we need the highest authority for transmuting Wilson's Albany Seedling and Parmelee's Crescent Seedling, into simple Wilson and Crescent; and even the *command of such authority* that it be done.

Gen. Wm. H. Noble remarks, "No man should market fruit who does not make it a business." In such case what would become of the small town and village markets, the capacity of which would fail to afford to any one a "business"? What, too, would become of the notably New England idea of mixed farming, with its "several strings for the bow," and its desirable facilities for the production of manures and the easier renewal of the fertility of the orchard or garden soils? I fancy, also, that the General will find it a bootless task, trying to persuade those of us who can grow Concord, Delaware, Salem, Wilder and even Rebeccas and Ionas, to train our palates to a liking for Clintons.

Is it not about time to look the question of the hardiness of the various berry plants fairly in the face? Truly the Cuthbert may be said to be more hardy than the Herstine and the Brinckle's Orange; but why not lay down the inflexible law of nature that no raspberry, black-cap or blackberry yet produced, *or ever likely to be*, is strictly hardy; that they are *brambles* growing naturally in sheltered localities, and that even our hardiest natives will fail when subjected to the unchecked influence of sun and wind in a severe Winter. Better think less of hardiness and more of nature's requirement—shelter.

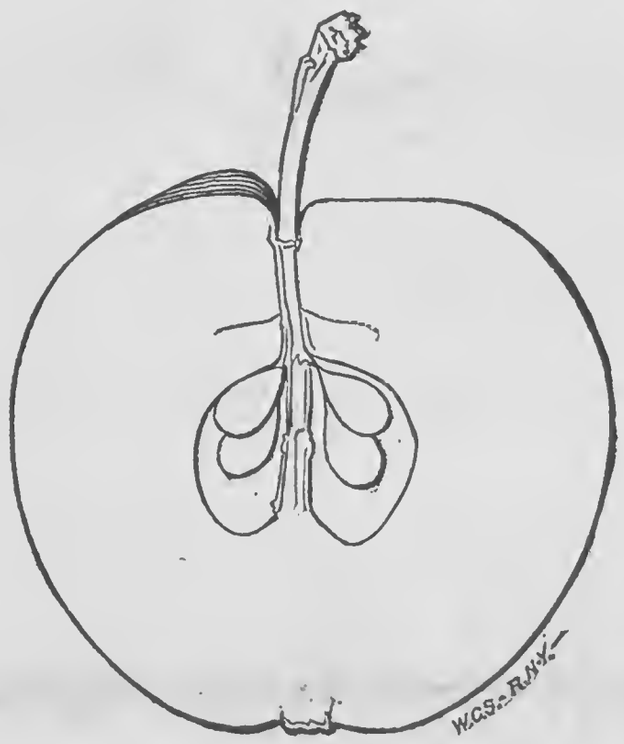
"What's in a name!" The person who christened his novelty Lost Rubies, should at once secure a patent on his discovery. So suggestive a name is pretty sure to attract attention aside from the quality of the fruit. I only hope we may not be disappointed in its quality and appearance.

It is refreshing to see the name of the honored and aged president of the American Pomological Society as a contributor to the horticultural lore of the day. I wish he might yet live a hundred years to contribute to the advancement of the great work in the development of which he has long been so important a factor.

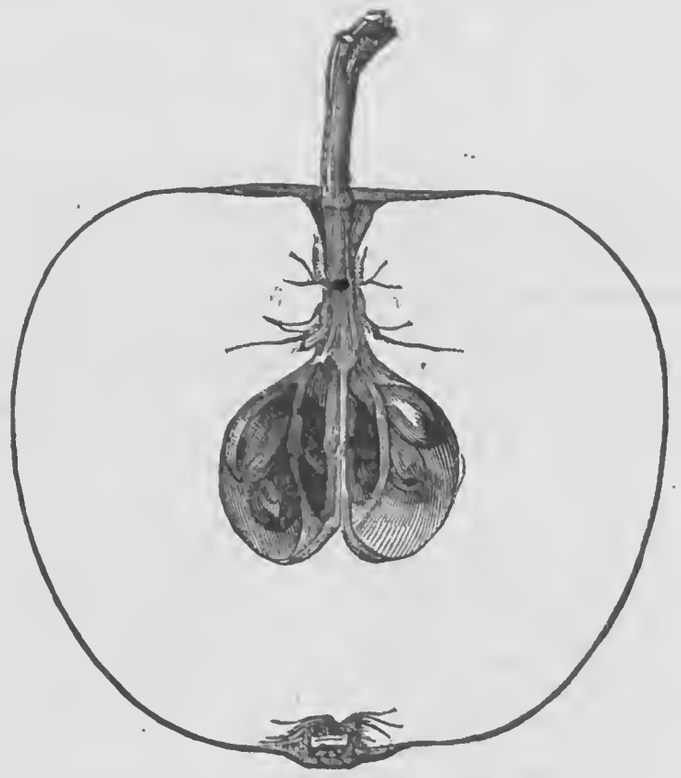
Neither the figures of Bidwell nor Shirts strawberries compare well with specimens as grown here, and as shown at our Michigan exhibitions; and I think I may be warranted in stating the same respecting the Marvin also. I am quite at a loss to understand this, when I consider that the Bidwell, especially, is found to be so highly successful with Eastern growers.

I was greatly surprised (as I fancy were many RURAL readers) at the apparent productiveness of Fay's Prolific Currant, as illustrated in the RURAL some months since. I would have hardly thought it credible but for the fact that the editor seemed to make himself responsible for its truthfulness. We are assured by the person who controls it that no plants have been disseminated, and yet I hear of its existence (or at least something under that name and claiming identity) in two or more distinct localities. It would perhaps be surprising that so pretentious a variety should have remained utterly unknown and in the hands of a single person for from 15 to 30 years.

[As to Fay's Prolific Currant, we make ourselves responsible only to the extent of producing accurately a portrait of one of the branches of fruit sent to us by Mr. Josselyn.—EDS.]



A HYBRID (?) BETWEEN AN APPLE AND PEAR—From Life—FIG. 335.



SHOWING VARIATONS IN FORM.—FIG. 336.

RURALISMS

THE crop of blackberries, in this vicinity at least, will not equal the great early promise, though there will still be plenty. The heavy rains just at the time the fruit was setting prevented perfect fertilization, and in some cases seem to have prevented it altogether. I find, on examination, that where the flowers were protected from the rain by leaves immediately above them the fruit is abundant and well formed; but where, on the contrary, the flowers were fully exposed many of them are either entirely blasted or have set very imperfect fruit. I should like to know if others have observed the same thing, as some interesting deductions may be drawn from it.

I HAVE seen a number of disk cultivators in use this season in corn and potatoes. I have not used one myself. It seems to me, however, that such a form of cultivator may be a very good thing among young plants, but I should suppose its use, especially among corn after it has attained to some size, would be very likely to destroy the roots, and so prove to be, in a measure, injurious rather than beneficial. I shall have occasion to see it many times during the season, and shall watch it with interest. An expression of opinion by such of the readers of the RURAL as have used it would be useful.

[We, for our part, should not use it in this way. Editors.]

IN the Spring I recommended the use of a lime and soot puddle for cabbage plants to protect them from the attacks of a certain maggot. In going about I have seen cases where it has been tried by some of the RURAL family, and the results were such as to leave

no donbt of its vaine. I kept my peace, and enjoyed a quiet satisfaction.

THE Lincoln Strawberry, on the gronnds of Mr. Peter Henderson, bore a splendid crop of large berries this season. When suited in soil and season, the Lincoln is probably the best of all the very large berries. It is the largest berry I have ever grown.

SPEAKING of large strawberries, the Shirts must take its place among them. It is not only a large, but a good berry. It is only just now, however, (June 25th,) ripening with me, and I will speak of it again. I may say, in this connection, that another new berry was proposed to be called Crinoline, bnt the name, I believe, has very properly been dropped. Shirts is the name of the gentleman who raised the berry so namcd, and, therefore, is all well enough, though sadly provocative to the punning propensity.

I AM glad to find that the editor of the London Garden is of my opinion, that Exochorda grandiflora is one of the very finest white flowering shrubs in cultivation. He calls it the Pearl Bnsh, and it certainly is a pearl among bushes. It seems to be rare also in England, and from the same cause that obtains here, the difficulty of propagating it, which difficulty, as I have before said, nurserymen onght to overcome. The plant is worth having at almost any price.

IN my allnsion to Mr. Samuel Allen, I said he was nearly ninety years of age; but I would have been nearer the truth if I had said nearly eighty. After mnch thinking I can remember what misled me, which was nothing less than one of the many humorous jokes of the late Mayor Harper. I might have passed the matter over as a typographical blunder, bnt the poor priuter has enough to bear; besides, it is my habit always to acknowledge an error when I make one.

IN putting out celery plants it is a very common practice in the garden to shade them with boards or otherwise. My practice for many years has been either to pnddle them before planting, or to give them a thorongh soaking immediately after it, and I have always found the plants to do better than when shaded. If planted dnring or just after a good rain, the plants will take care of themselves. Where it can be done as well as not, especially during dry weather, it is a good plan to pnt the plants out in the afternoon rather than in the morning. The night affords them time to recover in a great measnre from the shock of removal.

HORTICOLA.

Floricultural.

THE ROSE-COLORED WEIGELA.

TO THE late Mr. Robert Fortnne we are indebted for very many of onr ornamental flowering shrubs, and among the finest of them, and one that should be found well grown by all who admire the beantiful, is the Rose-colored Weigela—Weigela rosea. A large specimen, eight feet high and fifteen feet in circnmference, is just now (June 9th) in full bloom, and is a "blaze of beanty," if I may be permitted to nse such a term. As the RURAL NEW-YORKER is a journal for the suburban home as well as for the farm, I think a few words respecting this charming shrub would not be out of place and might, perhaps, be of interest to some of its numerous readers. I would not wish to describe, or to ask any one of my readers to plant a tree or shrnb that would not prove perfectly satisfactory in all respects, but I do know that this is a shrub that fully deserves all that can be said in its praise. It is too often seen in a half-dead or half-starved condition, and in this state no idea can be formed of its superb beauty.

The Weigela, or Diervilla, rosea is a deciduous shrnb growing about five feet high, of erect, compact growth with opposite, elliptical, ovate leaves, producing its large rose-colored, funnel-shaped flowers in large and graceful clusters from the axils of the leaves and the ends of the branches, in color varying from a pale rose to a deep pink. It belongs to the Natural Order, Caprifollaceæ, and was introduced from China by Mr. Fortune, who found it growing in a mandarin's garden on the Island of Chusan. Mr. Fortune also said that it was unknown in the southern provinces of China, and is not met with in the Chinese hills in a wild state. It is therefore just possible that it may have been originally introduced into China from Japan. This, however, is only conjecture. It first flowered in England in April, 1849.

Although it is a shrub of the easiest cultivation, it requires some attention to grow it to perfection, and this attention should be given to enable it to prodnce satisfactory results. To grow it to perfection it should be given a deep, rich soil. A yearly dressing of well rotted leaf mold, or manure will answer if the mold cannot be obtained, and if the manure can be forked nnder so much the better.

It shonld not be cut severely back so as to resemble a bundle of sticks, bnt several strong shoots shonld be chosen for leaders. These will also throw out other shoots from different places, and when the plant comes into bloom, will bend to the ground from the weight of the large clusters of beautiful flowers. As before said, the soil mnst be deep and rich, and if not so naturally, it mnst be made so. This is a most essential point in the culture of this plant. After the flowering season is over, cut out all weak shoots and at the same time cut the plants back into shape. If the leaders have a tendency to grow too rank, pinch them back so as to keep the plants in proper shape, but do not cut the plants back again until the flowering season is over.

The Weigela can also be grown as a standard shrub by selecting one of the strongest shoots, fastening it to a stout stake so as to keep it erect and also to prevent it from being broken off while young. As soon as it reaches the desired hight, pinch back the shoot and remove all the other shoots excepting those at the top. As soon as those top shoots are five inches long, cut them back to three inches and continue this process for one season. After the second season the shoots will require to be pinched back occasionally during the season of growth so as to keep the plants in good shape. Care must also be taken to remove all suckers as soon as they are noticed; thus grown the Weigela will prove to be peculiarly attractive and it will also admit of the grass underneath being cut by the mower. Propagation is effected by division of the plants, also by cuttings of the half-ripened wood, the latter method producing the strongest and best plants; but strong and healthy plants can be cheaply procured from any nurseryman or florist.

CHAS. E. PARNELL.

Queens Co., L. I., N. Y.

The Rough-Leaved Deutzia.

I desire to call the attention of the readers of the RURAL NEW-YORKER to the great value of the Rough-leaved Deutzia (Deutzia scabra) as a desirable flowering ornamental shrub, and as I do not think it is as extensively cultivated as its merits entitle it to be, a few remarks on its culture, etc., may prove of interest. During the last weeks of June we have not a very extensive variety of flowering shrubs to choose from, so that all shrubs flowering about that time should be known to all lovers of the beautiful. The Deutzia scabra is a native of Japan whence it was introduced in 1833. When properly grown it forms an erect, bushy shrub, growing from seven to twelve feet high with ovate, acute, serrate, rough, opposite, dark-green leaves, its beautiful white flowers in dense clusters from the wood of the previous season's growth. It is a shrub of very easy culture, thriving in ordinary garden soil with but little care and attention; but to grow it to perfection it is necessary that the soil should be both rich and deep. A yearly dressing of well rotted manure or leaf mold should be given it. After the flowering season is over, cut out all weak and straggling shoots, also pinch back all those shoots that show a tendency to grow out of place. This is all the pruning that is required. If the plant becomes too large it can be cut severely back during the Winter season, or after it is through flowering; but I would not advise any one to adopt this plan unless it is absolutely necessary. Propagation is effected by cuttings.

Queens Co., L. I. C. E. P.

Farm Economy.

CLOVER AS A PREPARATION FOR WHEAT.

PROFESSOR G. C. CALDWELL.

IT IS universally acknowledged that clover before wheat leaves the soil in a better condition for wheat than wheat before wheat; but it is also true that wheat requires much assimilable nitrogen in the soil for a paying crop, while in a crop of clover a much larger quantity of nitrogen is carried from the field than in a crop of wheat. This looks very much like eating our cake and having it too, which we have been taught from childhood up to be an impossibility. Can the curious fact be explained, or do apparently impossible things happen in the ordinary course of nature?

It is customary to account for this relation of the two crops by supposing that clover gets its nitrogen largely from the air, through its abundant foliage, and in its large quantity of stubble and roots transfers the necessary supply of nitrogen to the soil for the wheat crop. Nearly all who adopt this explanation go no further than to suppose that only chemically combined nitrogen of the atmosphere, which exists there as ammonia or nitric acid, is thus carried to the soil. Ville, who is well known as a writer on agricultural chemistry, his work on chemical manures having been translated from the French, and who is accepted as authority too often simply because what he has to say is well presented, and the reader has no opportunity to verify his conclusions, goes much further and affirms that the plant can assimilate or feed upon *free* or uncombined nitrogen. As this nitrogen makes up 79 parts in 100 of the atmosphere, while of the combined nitrogen there are but a few parts in a thousand million, the question is an important one, and it would seem that it might be easily answered; but thousands on thousands of opinions and observations of farmers themselves cannot settle it; it can be solved only by careful experiments in which plants are forced to grow without any other nitrogen than that in their seeds, and this free nitrogen. Three such series of experiments have been made—one by that veteran agricultural chemist, Boussingault, another by Ville and the third by Lawes, Gilbert and Pugh. The plain meaning of the results of the first and last series is that agricultural plants cannot thrive at all or make any normal amount of growth, if confined to these two sources of supply, while Ville draws the opposite conclusion from his results. No one who knows the whole history of these investigations is willing to adopt Ville's conclusions. Although the last and most elaborate series of experiments was performed after his own, by men of acknowledged reputation for scrupulous care and accuracy, and with results that tend most directly to cast doubt on the reliability of his investigations, he has never repeated his work, nor explained the discrepancy. That he still abides by his first conclusion is shown in the recent translation above mentioned, where he affirms that free nitrogen is the most suitable form for leguminous plants.

Now, if this is not true, and we insist that according to the best evidence it is not, the farmer who puts in clover to get a good wheat crop thereafter, is really only making some changes in the disposition of the nitrogen of his own soil, and drawing upon his stock of that substance *both* for the clover and the wheat, and is not adding anything of consequence to his available supply of plant nutrients; it is delusive teaching, for he who believes in it and grows clover much without manure is robbing his soil instead of enriching it. Those who have given the most careful study to the comparative growth of clover and wheat find no evidence that the former has any notably greater power to live even on the combined nitrogen of the atmosphere than the wheat possesses. Mr. Lawes found, as the result of his long-continued experiments, that "in soils poor in available or accumulated nitrogen both the growth and the after effect of clover were less than in soils richer in available nitrogen"—"that clover can be grown less frequently than cereals on the same soil without manure," and that it can be grown continuously only where the soil is more than commonly rich in available nitrogen as well as other plant food; at the same time he has proved by chemical analysis that clover stubble leaves the surface soil richer than before in nitrogen.

These observations point plainly to the conclusion that clover, like other plants, looks to the soil for everything except its carbon; and in benefiting a subsequent crop by supplying it with a larger quantity of available nitrogen, it only moves this nitrogen from one part of the soil to another where the cereal can get it more easily; it may possess a greater power of transforming unavailable soil-nitrogen into available nitrogen. Moreover, the cereal makes its most rapid and almost its entire growth in the early part of the season, while clover occupies the whole vegetative season. Many experiments indicate that nitrates or compounds of nitric acid contain the nitrogen in its most efficient form as plant food; nitrates are produced in the soil throughout the season by the oxidation of nitrogen in other forms, and are most abundant in late Summer and early Autumn, when clover is still growing, while the cereal is either off the ground, or, in the youngest stages of the new crop, is making comparatively little growth. Clover sends its roots to a greater depth and gets food from a larger volume of soil than the cereal, which is a shallow feeder. Thus though the crop carried off is large, the clover may yet leave in its stubble and roots a large quantity of the nitrogen that it has accumulated and in the surface soil where the shallow feeder can find it.

Thus it is evident that the relation of clover to the cereals can be accounted for without assuming what is contrary to the results of the most careful investigations—that it feeds on free nitrogen, or even that it feeds directly on atmospheric nitrogen at all, either free or combined. It is entirely possible to explain this peculiar effect of clover on the succeeding cereal, by referring it simply to the different manner of growth of the two crops.

Field Crops.

BLUE GRASS (Poa pratensis) IN THE SOUTH-WEST—BERMUDA GRASS.

W. B. HILLGARD.

THIS grass is, by almost universal consent, conceded to be the grazing grass, *par excellence*, of this continent. Kentucky has managed to make a special reputation for it, and it has unspeakably redounded to her material prospects and advantages. Almost the entire civilized world has come to concede the palm of superiority to the "Blue Grass region" of Kentucky for stock raising. Some mysterious virtue has been imputed to that soil, of which it is supposed to be the exclusive possessor, and which it seems to be thought is unattainable elsewhere.

There is nothing wonderful in this. Was there not a time when "Goshen butter" had its day and when many thought that it could not be equaled elsewhere? Did not New Jersey, 30 years ago, arrogate to herself to be about the only place where good peaches could be raised? Later, did not Delaware "follow suit," and with more grounds for the claim? All these claims are of the past. Kentucky raises fine Blue Grass. Her stock is the admiration of the world. Her people—particularly in the Blue Grass region—beggar panegyric; but she has not a *monopoly of Blue Grass*. I have ridden for days over the very choicest Blue Grass farms in the Blue Grass region, and know whereof I speak, having made two trips in different years for the especial purpose of inspection. I have carefully noted Blue Grass everywhere I travel, and I travel at the North and West much during the Summer, taking notes in every case in sections I have never before visited.

I do not know any grass that seems to "take" over so wide an area as Blue Grass. I see it growing here in the sandy land, and, only yesterday I saw a vigorous growth in a seam of the Custom House steps, in Mobile, and have seen it growing on the bare sandstone on the southern shore of Lake Superior in Northern Wisconsin. It can be seen along the moving sands in Michigan, along the eastern border of the lake of that name. In Central Delaware, even in the sandy lands, the commonest grass of the way-side is Blue Grass. In Southern Michigan, in the sandy lands there, it is considered next to a nuisance—because of its interference with wheat—under the name of June Grass. Along the road-beds and in the fields in Illinois and Wisconsin and in Missouri, superb sods are to be seen. Even in Eastern Kansas it is occasionally seen. Indiana claims (and with justice) to be a fine Blue Grass State. Need I mention more? [We have at the Rural Farm as much Blue Grass as any other.—EDS.] In fact, given sufficient rainfall and Blue Grass will do well anywhere. In this I do not disparage Kentucky; I only do justice to other States and to the facts.

Nor have I lost sight of a very important element, viz., the quality of the grass. I cheerfully admit that the ingredients of the soil in Kentucky are contributary to the quality of the grass and that the former explain the fine frames of the Kentucky stock. The lime in the soil of that State explains the quality of the grass. The lime rock is rich in phosphates and in some localities it is rather easily disintegrated. Rainfall and soil are the requirements for Blue Grass. Another important requisite is length of season or climate. As an illustration of this, Blue Grass meets with little consideration in Southern Michigan. It is there called "June Grass," for the reason that its season is mainly through June after which it dries up. It then comes on a little in late Fall. In the choicest district in the Blue Grass region of Kentucky it is often the case that the Blue Grass is burned up by droughts. I have seen tens of thousands of acres with absolutely no pasture at all in July. It was so the year before last. Let us take these requirements of rainfall, climate, limestone soil and see how they prevail in Eastern Mississippi and Western Alabama.

In these areas the rainfall is between 50 and 60 inches a year, and it is pretty evenly distributed throughout the twelvemonth. Except along the immediate Gulf Coast and the Western Pacific Coast, no country in the United States enjoys such a rainfall. Here is one absolute essential for the grass at its best. The absence of it explains the prohibition nature has put upon the cultivated grasses in large areas of the Western plains. Again, take the soil in Eastern Mississippi and Western Alabama, in the prairie belt; it is a deep, black soil, very stiff and aluminous, resting upon a greenish-yellow, greasy clay, which latter rests upon rotten limestone. It is surpassingly full of lime, so much so that in new soils it will take the hair off the feet of stock. It is very stiff and close, so much so that if it were not so full of lime it would, when plowed well, pack and bake so hard as to be almost like iron.

Yet, so full of lime is it, that, if plowed very wet in the proper season, it will crumble or slake like lime. Here is another great element in the mechanical character and constituents of the soil. Probably no country contains so much lime in the proper condition for plant-food as Eastern Mississippi and Western Alabama. The limestone rock is itself a fertilizer, and Professor Kedzie, of the Agricultural and Mechanical College of Mississippi, is applying it to the very poor lands of the college to enrich them. This rock goes to pieces very soon and becomes incorporated with the soil. Fine crops of one grass and another will grow on almost the bare rock, and good crops of oats are raised under the same conditions. Moreover, this black prairie soil is very fertile and deep and wonderfully retentive of moisture.

Consider, now, the subject of climate. The mildness of the climate makes almost always a growing season for Blue Grass from eight to nine months in the year, and, in some years, the whole year. Properly speaking, July, August and September should not be accounted the season for Blue Grass; although in July I have seen, in Eastern Mississippi, the rankest kind of Blue Grass, when at the same time in Kentucky, in the Blue Grass region, and elsewhere in the West, it was burned up by drought. In the above mentioned months (and for a much earlier and later season), Japan Clover—Lespedeza striata—and Bermuda Grass—Cynodon dactylon—may be the reliance for pasture.

Bermuda and Blue Grass admirably supplement each other, making, with White Clover, the ideal pasture, the former furnishing unfailing and most nutritious pasture from May until late October, and the latter from late October until July. They may be said to overlap each other, thus furnishing a variety of food and giving (by means of Bermuda) a "foot" for stock in Winter. They both grow well together and will flourish indefinitely upon the same sod, not impairing each other's merits, each having the ascendency in its season, the Bermuda Grass in its season seeming, to the uninformed, to have extirpated the Blue Grass, and generally Blue Grass in a few years exterminating clover on a Bermuda sod, while clover and Bermuda will continue indefinitely. Blue Grass makes a surprising growth in Eastern Mississippi, on the prairie soil, in Winter. I measured some that was 22 inches long several weeks ago, that could not have been sowed earlier than about the middle of last December and probably not until February. This was in a mellow piece of ground prepared for testing seed.

Last Winter was an uncommonly rigorous one, yet Blue Grass was seeding in early April on the prairies of East Mississippi. It has been said by pretty eminent authority in Mississippi, that Blue Grass sown at any time of the year will succeed. This I know from my own experience as well as from that of others is not the fact. I have known it to be sown in Spring and to be overtaken by dry weather and die. Last Winter I sowed 40 acres in late February and early March and have hardly a sprig. I sowed it on Bermuda without any preparation or after work. The same seed, sown on a heavier Bermuda sod earlier in December and January, gave a very good stand. I have never known Blue Grass sown in early October to fail.

Preparation of soil and proper seeding are best; but upon a Bermuda sod these are next to impossible; so the seed may be sown upon the Bermuda sod and left to be washed in and to take care of itself. The black prairie soil suits it best. Upon what is know as "post-oak" land Blue Grass does not do so well. The best sod of Blue Grass I have ever seen was on the prairies of Eastern Mississippi. Beyond all doubt that area is destined to become one of the most eligible stock-raising districts on this continent. Green fields are to be found the year round. Cattle can be fed on cheap lands with next to no feed, and fattened before the fields are green at the West and North. The markets of Chicago, St. Louis, Louisville, Cincinnati and (better still) New Orleans, are near. The country is pierced by a great trunk line between the South and West—the Mobile & Ohio Railroad. The sea is at its very doors (at Mobile) for shipment to Europe. I have sown one bushel of Blue Grass for over 150 miles on the line of the Mobile & Ohio Railroad, spinning the seed through my fingers out of the car windows, as we sped along. Notwithstanding the destruction of track, repairs, the rooting of hogs, grazing of cattle and other mischances, plenty of pretty "catches" are to be seen. Scores of people are sowing Blue Grass. One gentleman has over 200 acres and the area is constantly increasing. You cannot get off at any station on the Mobile & Ohio Railroad where you do not find spots of it. In a few years thousands of acres of it will be seen, as the people gradually work into stock-raising, as they are doing. There is such persistent insistance upon the part of some of the agricultural press that we can't raise Blue Grass in the Southwest, that I have thought it well worth this long letter to contribute something to the refutation of the pernicious notion.

Mobile Co., Ala., June 10, '81.

BROMUS SECALINUS.

This is a weed in wheat fields known as cheat or chess. The name is derived from the Greek *bromos* meaning food. It is an annual or biennial weed, introduced with several

FIG. 337.

other species of the genus from Europe, and it was actually, at one time, commended for cultivation. It is, however, worthless or nearly so. All the bromes are of graceful habit and may be employed as ornaments in vases. It is sometimes called Willard's Bromus from the individual who introduced it into this country. The stems, as the grass grows at the Rural Farm, are often three feet in hight bearing four or five leaves with striated sheaths. It bloomed this year July 1st. Chess is objectionable in wheat fields chiefly because of the difficulty in separating the seed from wheat, as also because cattle prefer almost any other grass. Many farmers, we find, still believe that when wheat is injured by being tramped upon or by frost or other causes, it turns, or may turn, to chess, and the question is still occasionally discussed in agricultural journals. It is just as sensible to suppose that Indian corn, under the same conditions, might turn to chess or that barley might change to wheat. This plant is an annual, flowering in June and July, but when it is cut sooner or otherwise fails to mature seeds, it survives and matures seeds the second year. It belongs to the natural order Gramineæ, or Grasses, and the tribe Festuceæ—Fescue Grass, etc.

Dairy Husbandry.

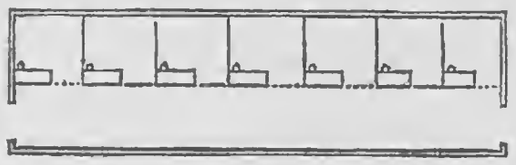
THE DAIRY COW.

HENRY STEWART.

The Care and Training of a Calf.

The rearing and training of the calf deserve the serious consideration of the dairyman and the owner of a choice cow, the calf of which is thought to be worth special care. It is to be regretted that so many promising calves are sacrificed to the butcher, and were it not that some wide-awake farmers are on the watch to rescue the best of them from the slaughter, the loss would be still greater than it is. The manner of rearing the calf affects not only the future cow, but also the value of the dam as a producer of milk. If a calf is permitted to suck the cow, the almost certain result is a loss of milk, unless care is taken to drain the cow dry as soon as the calf is satisfied. But there is a certain loss of cream, because the calf is in no way benefited by the feeding with the whole milk and is probably injured by it if its future purpose is the dairy. After the milk of the newly-calved cow has become of the usual quality, which is the fifth day, the calf may be fed upon warmed skimmed milk, perfectly sweet, however, mixed with about one-half new milk fresh from the cow. The proportion of new milk may be reduced gradually, until all skimmed milk is given. As previously stated, it is better to prevent the calf from sucking and to teach it to drink from the first. This may be done in three or four days by patient and gentle efforts. In thus weaning a calf it should be considered what a complete subjection of its natural instincts this is, and due allowance should be made for the reluctance or perversity of the young animal. Kindness and patience should therefore be exercised in this first lesson of its training.

There are some provisions to be made that will greatly help in this training and that will compel the calf to fall in with its owner's wishes. These may be noticed *seriatim*. First, the calf should be kept in a convenient pen in which it may be under complete control. If the cow has herself been trained in the same manner there will be no necessity to remove the calf out of sight or hearing, but generally it will be found most convenient to provide a special pen with a small yard attached for the accommodation of the calves. This may consist of a series of stalls six feet square, each provided with a small feed trough and a ring to which the calf may be tied. A roomy passage in front of the pens gives admission to each through a small door (see Fig. 339). A leather strap with a ring attached should be fastened around the neck, and as soon as the calf will



PEN FOR CALVES.—FIG. 339.

drink from the pail it should be tied up with a rope-halter giving it about 18 inches of loose rope. Until it has learned to drink it is best to have the calf loose in the pen. It is taught to drink as follows:—Holding the pail with the milk in the left hand (a 10-quart tin pail kept for the purpose is the best), the calf is taken by the head, with the nose in the palm of the hand, and the two middle fingers previously dipped in the milk, in the mouth. The calf will begin to suck the fingers and is then backed up into a corner of the pen and its head is pushed down to the milk so that it can suck it up between the two fingers, kept a little apart. Several trials may be required before the calf discovers what is meant, but with a little perseverance the calf will take to the milk as soon as it succeeds in getting a little of it. Care must be taken not to cover the nostrils so as to prevent breathing, and it may be necessary to dip the fingers in the milk once or twice until the calf can be induced to suck them. When it begins to suck the fingers the trouble is nearly over. The main difficulty is then to teach it to drink without the fingers, and this is done by gradually withdrawing them but still leaving the hand on the nose. By-and-by this may be gradually discontinued and the calf left to drink. In this way from three days' to a week's training will break in the most stupid calf and an extra-bad case may be broken in by leaving it without a meal until it is hungry enough to act reasonably. This is generally successful.

As soon as the calf drinks there is no more trouble. It should have its meal three times a day: in the first week two quarts at a meal are sufficient; the next week, three quarts may be given night and morning, with two at noon. After four weeks, nine or ten quarts a day will be taken and a little fine clover hay may be hung in a small bundle in the pen for the calf to nibble at. Some calves will begin to eat hay at a week old and all will try it at three or four weeks. At this age the calf may be taught to lick a little ground oats and corn or to eat a spoonful or two of oats. When it will take these a small ration should be given daily, at the same time that the cows are fed. In the Summer a handful of the sweetest grass or clover may be cut for the calf and given to it in its trough. It should be kept clean by brushing and the pen be well littered. If this manner of feeding is continued up to three months, gradually increasing the solid food, keeping up the supply of warm skimmed milk twice a day, and giving a little fresh water at noon, the calf will be as large at that age as one fed in the usual haphazard manner would be at six to twelve months. In fact, this period is the making of the future cow. The milk so long continued, and the oats, give a grand development of bone, muscle, stout limbs, deep body, broad loins and hips and an elegant and graceful contour. The hind-quarters and abdomen are developed and become large, the udder and teats become well formed while the head and neck remain fine and delicate.

After having raised many calves into excellent cows I find no other food so useful in forming the animal as warmed, skimmed milk with a daily ration of oats, beginning at a month with a handful and reaching at four months to a quart. Corn meal is objectionable as it fails to develop the bone and muscle and a desirable and graceful cow form; and produces an animal more inclined to beefiness with coarser points than should be sought for. It may be objected that form does not make the good cow. But this is altogether a mistake, at least so far as this, that the form and the good cow always go together, the good form being an indispensable attribute of the good cow. If this is so, it seems to follow, in a measure at least, and subject only to exceptions, that if we secure the good form we get the good cow. And in rearing and training a calf we surely lay the foundation for a good cow when we develop a capacity for eating, digesting and assimilating food; when we gain a large frame, well proportioned, broad hips, deep ribs, large pelvis, large udder and good teats and when we lay the foundation for a robust and stout constitution.

We secure a good temper, kindly dispo-

sition, absence of any vice or bad habit, by kindness, fairness, regularity of attention, frequent handling, tying in the stall, leading by the halter, and the use of the separate pen. Troublesome tricks are not learned; the calves cannot suck one another; will not learn to suck or chew harness, rags, etc., etc.; will not learn afterwards to suck themselves and will always be easy to handle and lead. After they have reached the age of six months, they will know more than many cows and when turned out to pasture will go to the business of feeding in a business-like and successful manner. For training a calf to lead, a small head-stall with a ring for a halter should be worn, as the neck strap does not give one sufficient control over the young animal.

The above remarks refer in greater part to calves dropped in the Winter, but Summer calves may be better raised in a similar manner in every respect, than in any other way, excepting perhaps that they may be turned into a paddock or small pasture in the day time; but this should not be held to make the feeding mentioned unnecessary; that is requisite in addition to whatever pasture or hay or grass may be consumed. When the calf reaches the age of 10 to 12 months under this treatment it becomes sufficiently matured to enter the class of breeding heifers. In the case of a bull calf precisely the same treatment should be adopted, adding to it perhaps a little stricter discipline.

The Herdsman.

"THE TOUCH" OR "HANDLING" QUALITY OF CATTLE.

In judging of cattle with reference to their quality as beef animals, ocular inspection is useful to a limited extent, but, certain it is, that a blind butcher or other expert will make a better selection of cattle either for immediate slaughter or for feeding than one judging solely by the eye. The hand is deftly placed upon ribs and rumps and passed along the loins and the loose flanks. A gentle pressure is given by the tips of all five fingers in a way to ascertain the softness, pliability, elasticity and mobility of the hide. This is accomplished both by the pressure and by a slight thrust given to the fingers, and ascertained by a "sense of knowledge" which is begotten by experience. The hand also grasps the hide over the ribs, taking up a handful by which its thickness is perceived, and the other points of quality confirmed.

No one with a modicum of experience can thus handle a few "beef critters" without observing notable differences in their skins, the unctuousness of the coats of different animals, the softness, thickness, and pliability of their hides, and the amount of fat which underlies the skin. He will perceive also a difference in the coarseness, softness, harshness and wooliness or furriness of the hair, and this is a disturbing factor in forming a correct judgment as to the quality of the beef, until one learns to allow for it.

Health is indicated by the skin being in a condition to perform its important function, hence it should be soft, flexible and elastic and there should be enough of that oily or soapy secretion which gives unctuousness to the coat. It should also be free from lumps or ridges, and uniform over the fleshy parts of the body

A WORD FOR POLLED CATTLE.—One thing seems certain—if we had never seen cattle with horns we would not desire to have them any more than we would wish to have horns upon our horses. The desire for horns is only a matter of habit. Horns are only necessary under wild and savage conditions of life, they are wholly unnecessary under our conditions and civilization. They cause beef to cost 20 per cent. more delivered in Liverpool than it should. Carrying deadly weapons is no more necessary for our cattle than it is for ourselves. It leads to as bad passions and injurious habits among cattle as among men.

D. S. MARVIN.

Sheep Husbandry.

SUCCESS WITH SHEEP.

I HAVE had pretty good success with lambs. I use cows' milk when there are twins, and lambs will grow just as well upon this as when sucking the ewe, and much better if they do not get enough from the latter. I think the whole trouble with fed lambs is that too much is given them at a time, and that they are not fed often enough. I have invariably found that hand-raised lambs will die if not fed as late as nine o'clock at night, and as early as five in the morning for the first week, and they should be fed every three hours through the day until three weeks old; after that age they will pretty much take care of themselves, if feed is plenty. In case of twins, it is much the best plan to feed them extra milk, if they do not have enough from the ewe, or if one is weak. Twin lambs are just about as good as single, but they take a little longer to get ready for market. I sometimes hand-raise a lamb for a few days, and then if a ewe loses her lamb, I give her the hand raised one. I have 75 lambs out of 82 dropped. Of the seven lost, one was aborted; one so deformed that we had to kill it; one was killed by setting the feed trough on it; one by getting hurt in the bars; one by drinking coal oil that was left where the lamb got to it; one by castration; and another from the latter cause or general debility. I have lost one old sheep by disease, one by getting its leg broken in the pen, and one was killed by dogs. This is the loss for one year on 75 head of sheep and lambs summered and wintered, and 82 lambs about ready for market, a loss of five lambs too many.

Mercer Co., N. J. I. J. BLACKWELL.

SHEEP HUSBANDRY IN INDIANA.—Sheep husbandry has been greatly stimulated in the last few years; causes fewer dogs, better markets for the products and the introduction of better breeds. The long-wool mutton breeds are most numerous. W. H RAGAN.

Clayton, Ind.

The Poultry Yard.

NUMBER OF CHICKS TO THE PEN.

L. S. HARDIN.

In raising chicks with brooders and in pens the number to be put together is of more importance than at first thought would appear. This is some of the knowledge one acquires at considerable cost when he first goes into the business. I remember a farmer who once allowed his hogs to sleep in the hollow of an immense sycamore tree. The area was limited to accommodate about half a dozen hogs, but there was practically no top to the pen, and one very cold night the hogs climbed on top of each other until the next morning when they were found six or eight layers deep with all but the top rows dead from suffocation. This same danger is always to be apprehended with chicks in a pen, if allowed to get too cold. While young chicks show a decidedly gregarious instinct, they have, even when in the greatest numbers, no disposition to crowd one another. When but a few hours old, if put in a warm brooder, each one lies by itself, and if the brooder is full of them, they spread out like an immense pan-cake, looking the very picture of comfort and contentment; but let the temperature in the brooder begin to fall, and they move up closer and closer to one another and begin a peculiarly anxious chirping, as if each one was crying with the cold. The little ones crawl under and lift up the larger ones, and they finally get matted together in an amazingly solid mass. It is under these conditions that the weaker ones are certain to be squeezed to death, and even the stronger ones, when unfavorably located, often succumb.

For this reason all brooders should be not too large, holding never over fifty chicks, and they should be artificially heated. If more than fifty chicks are in a pen together the heat of the brooder is not always utilized by them. On the contrary, if the room is a little chilly the chicks are sure to gather in a mass outside the brooder, and some of them will be crushed. It is very difficult and generally impracticable to keep a room constantly heated above sixty degrees, and a temperature lower than this is sure to bring the little ones together in dangerous masses if allowed to run in large flocks.
